SELL THE

Lob Ingir, or True Commercial
Smyrna Fig

Dr. Eisen, the world's authority on Figs, says the Lob Ingir is the genuine commercial variety. This is the kind we sell. We are prepared to supply purchasers with the necessary fig wasps or Blastophaga when their trees reach the proper stage. We can fill any sized order for these figs and at prices within reason,

We also have for sale a full assortment of

FRUIT TREES and GRAPE VINES

in all Leading Varieties. We can furnish

TILTON APRICOTS

in quantities at the same price at which other Apricots are sold. Our trees are grown on virgin soil, and are bright, clean, thrifty and possess a perfect root system. Catalogue free. Write us before you buy from others. Address

Pruning Grape Vines...

BY J. W. MILLS, ONTARIO

When a young vine is planted in the vineyard, it should be trimmed to two buds. During the first summer after planting, it is not necessary to tie it to a stake unless it makes such a rank growth that it lies flat on the ground and forms a heavy rigid stem. It should be tied up straight before it reaches that stage. We have seen vines in the Coachella district get beyond control from a cutting inside of eight months. In such instances the vine is two years old, compared with vines as grown in recognized grape growing districts of the state. The object to keep in view, is to form an erect trunk with branches forming a crown at least one foot from the ground. This connot be done unless the vines are staked while still small and easily bent. Where the vines make a growth of a foot or 18 inches and the canes are as large as a lead pencil, the first year, two buds are enough to leave for the following year's growth. Where the canes are half an inch or more in diameter at the base, three or four buds may be left and the permanent head or crown formed from them. After the second year, two buds to each spur may be left, and the spurs may be increased as the vines grow stronger. The spurs are what remain of the canes after having been cut back to from one to three or four buds.

When sprouts come from below the head or on the branches below the spurs, it shows that the vines require more buds in order to take up the full flow of sap. At the following pruning, more spurs should be left on the vines or the same number of spurs should be allowed more buds. All sprouts below the spurs should be rubbed off while they are still brittle. These rules apply to starting young vines, whether they are long, half long or short pruners. Vines which have the main trunk or several branches which should form the main trunk, sprawling on the ground, are an agravation to the pruner, and the person whose duty it is to take care of the vines. Part of the crop will lie on the ground and this is objectionable.

* * *

After a vine is well started and has a well balanced top, it is ready to bear fruit. This should be in the third year from planting. The main object then is to make it bear fruit with the proper amount of leaf and branch growth. Pruning that will induce an abundance of foliage and branches will do so at the expense of fruit. On the other hand, pruning that will produce an abundant crop of fruit will do so at the expense of the foliage and if the pruning for fruit is carried to an extreme, the foliage will not be ample enough to shade the fruit and as a consequence it will be inferior. The limits of the two extremes can be determined by a little experience; no two classes of land will produce results that any rule will cover. It must be remembered that the most vigorous canes are the most liable to be non-productive. On the other hand, most varieties of vines which have small weak canes should be pruned short. Buds near the base of the canes are also non-productive as a rule. Canes of medium vigor are therefore the ones to be pruned for fruit. When there is a choice between the three kinds of canes, remove the small and most vigorous, but give those remaining one or two more buds than would otherwise be given them. This is especially desirable in the case of long pruning.

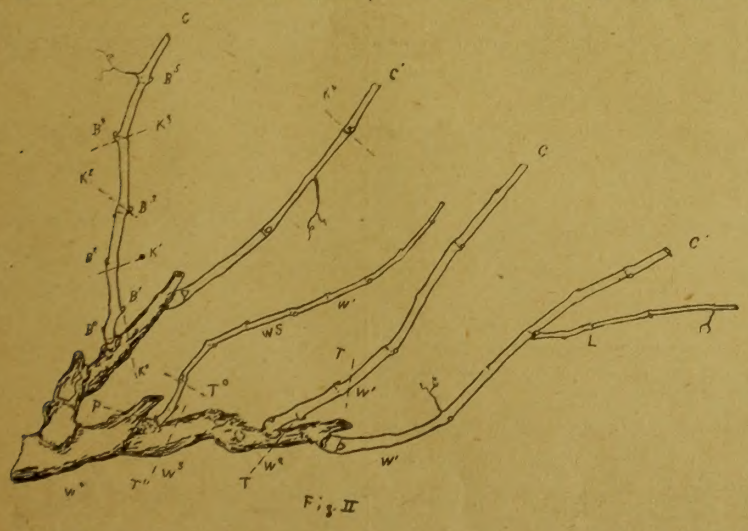

Fig. II

* * *

There are three principal methods of pruning; short, half-long and long. Each of these has a modification which make six styles of pruning. When vines are run on a trellis or wires, each of these methods may be used at intervals along the horizontal trunks.

The greatest number of vines in this state are pruned short as shown in Fig. IV. The vine is kept as near as possible in the shape of a goblet. In this style of pruning, but one spur is usually left on each lateral branch, the outer cane being removed at K0. Fig. II. The remaining cane should be cut off at K2, which leaves two fruiting buds, as the small bud near the base is not counted. If the vine continues to throw out sprouts below, and the variety produces abundantly when trimmed to two buds to each spur, more spurs should be left and the cane C. I, Fig.II, may be left and trimmed to two buds as in the other cane. If a vine is inclined to spread and flatten out, they should be pruned to canes that assume an upright position. Vines that have a tendency to grow upright and form too, close a head, should be spread by pruning to canes that have an outward slant. The direction of these canes can be secured by cutting to buds that point in the direction that it is desired to have the canes grow. If the vines seem to be getting out of shape by flattening out, it may sometimes be drawn in by pruning to a sprout that comes out of old wood, as WS. in Fig. II. As part of the bearing surface is thus removed and the sprout referred to does not usually bear fruit, more buds should be left on the remaining spurs. The sprout should be trimmed to two buds which will send out canes that will produce fertile buds the following year.

Fig. IV.

Fig. V

Some varieties of grapes bear better if pruned to four or five buds to each spur. This method of pruning is called half long. It is essentially the same as short pruning, except that the spurs are much longer as indicated, and besides these spurs or short canes with four or five buds, there are spurs of one bud left at the base of the long one, as at W. in Fig. V. In pruning these spurs to one eye, the basal eye is not counted. This eye will make a cane during the next summer provided the cane C. has not been left too long. At pruning time, the canes C. having put out from three to five fruiting canes each and borne their crop, should be removed with part of the old wood at K. This will leave two new canes that have grown from the short spurs. The cane from the basal bud can be used to make a short spur again and that from the other bud will provide for the half-long pruning that gives the three to five bud cane. In this way, the crown of the vine does not grow up out of reach and become ungainly. These

TYPHOID FEVER CURE.

Remarkable cures of typhoid-fever patients are reported by Beth-Israel Hospital, where a serum importeo from Italy and Switzerland is being used. Although the remedy has been in use more than three months, is has just been made public. In that time thirty cases have been treated at the hospital, which is in the most crowded quarter of the East Side. Not one of the patients died, and in some instances improvements set in before the fever had run more than half its regular course.

A small quantity of the lymph is injected into the body three times a day, sometimes in the thigh, sometimes in the breast. The operation is of the simplest, and practically painless. The injections are followed by regular treatment for reducing the temperature, careful diet and nursing.

Physicians in charge of the institution refuse to discuss the matter fully, pending the preparation of a detailed report on each case, for the use of the medical profession. They admit the successful use of the new serum, but maintain that the treatment is still in its experimental stage.—Medical Record.

OF GENERAL INTEREST.

The Year 1903.—No year in the past decade goes out with more well defined incidents than the year 1903. In some particulars it has been a year of startling and singular conditions. It was ushered in with pomp and ceremony and heralded as the banner year to be for speculative investments of the past quarter of a century. In many particulars this prophecy has been verified. Financial propositions of stupendous movement have been floated and the results have apparently been satisfactory to those who engaged in them. In some of the essential commodities of life prices have been unprecedentedly high. Beef for instance, has gone almost to prohibitive prices. Cotton advanced, at one time to a figure it has not claimed since the war of the rebellion. Steel and iron have been in active demand at prices which have stimulated the great plants to their fullest capacity. The crops in the middle-west have been abundant in price if not in quality. Wheat which has been lacking in amount has more than been made up in the high prices charging for the shortage. All the products of petroleum have advanced from twenty-five per cent.

* * *

On the Pacific Coast development in every condition of trade has been most gratifying. The Orient has turned into our ocean ports a continuous stream of commercial products which have kept our transportation lines filled to their fullest capacity.

If we are to take the word of the passenger agents of the trunk line rail roads, no year in the history of California travel will exceed that of the present. Our products have been sold at remunerative prices and our farmers and orchardists are well satisfied with their profits. The rail roads report one of the greatest volumes of business in the history of the transportation lines. So immense has been the traffic that the capacity of every line in the west has been, and is taxed to its limit.

* * *

Merchants all over the country have done well, so that it may be said prosperity has been universal.

It is true in a few instances failures have followed promotion, but these were only individual cases and no disaster of a public nature followed. This is always to be expected where men plunge, or work the market for speculative purposes. The banks of the country have been, and are, sound. There is an abundance of money with which to transact the necessary business of the country, and money from abroad is lying idle waiting for securities to fall to a safe basis where purchase is regarded with some certainty of profits. The supply of money in the United States was never so large as today, and never so good. Our stock of good money is 1300 millions of dollars, double that of England. In five years it has increased nearly 400 millions with us, or as much as the gain in all Europe, with five times our population. The per capita stock of good money is in the United States, $29, France $24, Germany $13, other parts of Europe $3 to $9. The United States alone is producing each year over $80,000,000 in gold, or more than one-quarter the world's production, and most of it is coined into money.

In the past five years money in circulation has jumped from $24 to nearly $30 per capita, and the part of gold in it from $8.75 to 12.50. On top of all this put the fact that the gold in the United States treasury is greater than the deposit held by any other nation.

These amazing facts follow a period of high prices and still higher wages. Some settling down will do good, all along the line. Meanwhile the area of land remains fixed—there are no more free farms. Advancing land values and prosperity for the farmer are evidently assured for the future.

* * *

Locally, in the cities of this state, the holiday trade is reported as more satisfactory than last year. People have money. It is not alone in the pockets of the rich, but in the pockets of the laboring man and his wife. Under all those circumstances we may write the year as one of great prosperity and the prospect for the year to come as fraught with no apparent disaster in the financial world.

* * *

In one particular the year presents startling accidents. Disasters by rail have been frequent and terrible. They have followed one another with wonderful quickness and seldom have we witnessed more serious results. If these appalling accidents shall open the eyes of the managers of our transportation lines to the necessity for great vigilance in handling trains in the future, it will be well for those who live today and must travel the country in pursuit of business or pleasure.

* * *

The criminal record has been badly shattered this year, for the number of crimes in the catalogue has been enough to blanch the cheek of him who reads them from day to day. It seems, try we never so vigilantly to uphold the laws and prosecute criminals, we cannot keep pace with the volume of murders and other crimes which fill the dockets of our courts.

* * *

But while the criminal calendar has apparently grown in volume in the past year, agencies for good have been at work to overcome the war like tendency of the times. Peace conventions in England, have had their counterpart in the pulpits and rostrums of America, where eloquent orators have proclaimed the gospel of "Peace on Earth" as the corner stone of national growth and perpetuity. Prominent in this grand work has been the President of these United States, whose counsels have been for peace and obedience to law, both human and divine. To him the country is indebted for the reasonable tranquility it has experienced in the ranks of the American laborer. Of course there has been disturbance along this line, but not to such a degree as to create anything like universal unrest. Let us hope there will also be a diminution of the labor trouble in the year 1904 for in no country on the globe are there better fed, better clothed, better paid workingmen than in these United States.

* * *

We cross the threshold of the new year animated with hope and full of ambition to make it one of the greatest in the Nation's annals. The Cultivator shares this universal expectancy and to each of its ten thousand and more subscribers sends greeting, with the wish that every joy and all prosperity may attend one and all.

* * *

Trouble Feared.—The decision of Judge Trask in the matter of the orange growers and the citrus union continues to be discussed at great length in the East, where the sales of the union are conducted. The refusal of the court to enforce by injunction the Citrus Union contracts will, it is claimed in green fruit circles, reduce the proportion of fruit the combination now expects to handle. Last year many cars of fruit sold for less than freight, and hundreds of cars brought growers into debt, the freight being 90 cents per box from California to points in the East, plus 25 cents per box if the fruit came in refrigerator cars. Contracts between the growers and the union this year were believed to be unassailable, and the new court decision, it is asserted, now places the grower in a position in which he can continue to send his freight through the union, if he sees fit, or can sell elsewhere if he thinks he can secure higher prices. The decision is keeping green fruit circles guessing as to what the outcome of the litigation will be, for if Judge Trask is sustained in his opinion by the higher court, the door will be wide open for wholesale desertions. The friends of Fruit Agency contracts contend, however, that the present conditions will not be changed nor will the business of the agency be materially injured, as some of the commission men affect to believe.

* * *

Rain.—The northern counties are happy in another wetting, the middle counties had a little and want more. The southern counties had nothing but a drying "norther."

The "moon has changed" but the weather didn't. Even the ground squirrels, which built their nests in trees in anticipation of a flood, are coming down, and the only thing which looks like rain is the farmer's face, which looks like a thunder cloud.

There are records of other years which show wet seasons which had almost the total precipitation after this. So we will not be blue and grumpy. It will do no good.

The only satisfaction in the whole proceeding is the opportunity it gives to abuse the weather bureau.

* * *

Possible Shortage of Grain Crop.—The crop report of the United States Department of Agriculture, issued this week, predicts a shortage in the grain crop of Southern California for the coming season.

The citrus crop of Southern California is in good condition, as winds have accompanied the few cold nights, doing away with frosts.

Up to date we have had this season but .43 of an inch precipitation; yet this is not unprecedented, according to the reliable statistics of the Weather Bureau. Before the government opened its department here, says the Times, rain records were kept by C. Ducommon, and among these is the table for 1876, showing that but .40 of an inch fell from September 1, '76, to January 1, '77. The record-breaker, however, occurs as recently as 1898, when only .23 of an inch of moisture came down before January of the following year. In 1891 the precipitation was rather small, only .94 inches falling before the last two or three days of December. In 1895 the precipitation from September to December, inclusive, was 1.82. In great contradistinction to these figures is the very wet record of 1889, when 15.80 inches of rain fell during December alone.

After learning that our dry spell is not unprecedented, interest naturally centers in the rainfall of the early months of the years following. The well-remembered season of 1898 was the record-breaker, and in January, '99, there came 2.64 inches, but .23 of an inch having preceded it during all the months before. February brought but .04 of an inch, March 1.81 inches; April, .18; May, .04; and June, .58. The total rainfall for the season was 5.52 inches. Following the early dry spell of '95, January, '96, was productive of 3.23 inches, and the season's total was 6.69 inches. Following another fall drought, February, '92, brought 3.19 inches, and the season's total figured up very decently to 9.80. In 1877 the result was not so good, only 4.88 inches falling throughout the year.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

TROUBLES TROUBLE THEM.

The Erie Railroad's decision to allow the auctioner first place who has the largest number of carloads of oranges for sale each morning has caused great uneasiness to the independent shippers. Heretofore, it is said, the auctioneers "rotated" in the use of the Erie's auction rooms in New York. The Erie's late order gives the preference to the California Fruit Agency's fruit only when that organization has the greatest number of cars, which is equivalent to giving our organization the lead all the time. Last Monday Brown & Secomb for the independent and The Fruit Auctioning Company for the Agency, held their auction sales simultaneously. This action resulted from the order to allow the heaviest holders the preference.

Friends of the agency claim that they are but receiving a just recognition as large shippers. But aside from that, the Agency is only the seller, for a large lot of small growers; and not the owners of the fruit. It is not a "combine" in the offensive sense used by those who expect to profit by remaining outside the Agency, which latter is primarily formed to prevent improper distribution. If, in pursuance of the policy of suitable distribution the Agency put twelve carloads of oranges upon the New York market last Monday morning it cannot recognize the right of a small contingency to side-track the fruit while that contingency proceeded to destroy the policy which is the most potent reason for the existence of the Agency, namely, the policy that recognizes the supply of the markets without dearth or congestion. If a small lot of fruit gets in the way of the execution of a plan approved by 80 per cent of the growers it is not expected that the larger interest shall give way.

General Agriculture

CALIFORNIA ORANGE MARKET.

Receipts this week of Northern California navels have consisted almost exclusively of immature, pale and greenish stock, and there is only a very limited demand for this class of fruit this season. Sizes have also been out of range, very few of the cars carrying anything outside of 80s and to 126s.

A car of Mariposa brand, which sold on Wednesday, had very fine quality, but a great portion of the fruit lacked color. This particular car ranged from $3 to $2.35 for sizes 64s to 126s. There is a strong demand for navels at the present time, but they must have the right flavor and color to interest the New York trade. If a car of this kind shows up it will be welcomed by the trade with open arms. When California navels reach the right stage of maturity and color dealers will extend the "glad hand" to them with great gusto.—New York Fruitman.

GOOD APPLES AFFECT ORANGE SALES.

"Has it ever occurred to you," asked a Washington street merchant of the Guide man last week, "that this disastrous slump in the orange market, which is troubling so many receivers right now, is in great part due to the remarkable excellence of the apples now arriving on the New York market? Not in many years have the public enjoyed a chance to eat such good apples at such low prices. For many years past the apples at the stores and on the fruit stands and barrows on the streets have been unattractive in the extreme, both to the eye and taste, but this year one can get a first-class apple at a very cheap price without the slightest difficulty, and the show made on the fruit stands is attractive to the eye to a most remarkable degree. This is bound to have a bearing on the orange situation. Take my own individual case, for instance, to show you how things work out. I sent over a barrel of Almeria grapes and a barrel of apples for my household use a week or so ago. The grapes are practically untouched; the barrel of apples is almost gone. I am not asserting that when a man wants to eat a grape or an orange that he is going to be satisfied with an apple, but I do say that a full supply of excellent grade apples obtainable with the greatest ease and at moderate prices is bound to injure the consumption of other fruits."—Fruitman's Guide.

SILK CULTURE IN ITALY.

About 500 A. D. Persian monks first brought silkworm eggs concealed in the head of a hollow staff to Constantinople. Thence silk culture spread into Greece. A little later conquest carried it to Sicily. From there to Italy it was but a step. Soil, climate, people suited it. The industry took root, grew, throve and continues to this day. The thrifty peasant manages to get silk and oil and wine from the same small holding. First, he plants his mulberry trees, 16 feet each way; next he prunes the heads into a hollow cup and trains his vines all over them, and finally around the edge he sets a shelter of olive trees. So all seasons bring him labor and the reward of it.

REMEDIES FOR ROSE AND OTHER APHIS.

KEROSENE EMULSION.

This is very useful in the garden as well as the orchard. It is harmless to vegetation. Whale-oil soap, one-quarter pound; two quarts hot water. Melt the soap, and then add one pint kerosene. Churn the mixture until it emulsifies or forms a cream. Dilute with 10 or 12 times the amount of water.

HOT WATER.

Submerge the parts affected in hot water of a temperature of about 125 degrees. This will kill the aphis, and is sometimes useful when the insect attacks house or garden plants.

TOBACCO DECOCTION.

Make a tea of tobacco stems or dust by boiling thoroughly. Add cold water till the decoction contains two gallons of liquid to one pound of tobacco.

MUTILATION OF TREES.

Why is that the telephone company's linemen seem to take pleasure in butchering or maltreating the street trees whose branches interfere with their work? It may be necessary to top a tree or to cut out a limb entirely, but that is no excuse for the wanton mutilation with an ax. Are there no rights in the premises other than the will of a corporation or of its employes?

BERMUDA GRASS.

Editor Cultivator.—The killing out of Bermuda grass, or Johnson grass, is indeed a serious problem in the orchard or among small fruit. But I have had both of them, including the Devil grass, and have had no special trouble in getting rid of the first two varieties. As no plant can live without breathing, and as the leaves are the lungs of plants, no foliage, no growth. We well know that many plants will sustain life in different form a long time, as in dormant tubes, rhizomes and buried stems or cuttings, but we should never bury the stems of any of the above plants when there in any moisture in the top soil. Our experience is that the Bermuda grass, or Scertch grass (Cyno'don Dactylon), does not propagate from roots below the crown of the plant; but from seed and joints) or whole stems on moist ground, or when covered with soil will hold their vitality a long time. Our mode is to plow very shallow when the weather is quite dry and gather and burn as soon as dry, and it drys very quickly in hot weather. We have known of large fields of Devil grass completely subdued by a season's cultivation without crops but where celery will grow, one or two crops of this paying vegetable will eradicate the nuisance if the crops are cultivated thoroughly.

The Evergreen millet or Johnson grass (Sorgum Halefense) is the worst of the three, when it comes to clearing the soil where it has once got a strong foothold, but by continued effort, by not letting any foliage appear, it must in time succumb. They are all very useful forage plants in their place, but California is not the place. It would be hard for the stockmen of the Hawaiian Islands, if they were deprived of Bermuda grass. It is a valuable grass in most warm countries—but everything in its place.—S. J. Murdock.

CROP EATEN BY INSECTS.

Prof. Skinner of the National Academy of Sciences, says the Baltimore Sun, makes the following estimate of the damage done to crops by insects: One-tenth of the total agricultural produce, or $300,000,000 worth, is eaten up or lost every year through insects. One-half of this is loss to the staple crops. Credit is given to various insects about as follows: Hessian fly's damage to wheat, rye and barley, one-tenth, or $40,000,000; chinch bug, $7,000,000; corn root worm, 10 to 20 per cent. in many States, certainly averaging 5 per cent., or $37,000,000 of the corn crop; total to growing cereals, $84,000,000. In seven gulf States damage to corn has been estimated at 20 per cent. and at 5 per cent. for the whole country, making the total $40,000,000. All other stored grain is estimated at 3 per cent., or $20,000,000, making a total approximate damage to stored grain amounting to $60,000,000. Grass and hay, $20,000,000. Cotton, by the cotton worm, boll worm and boll weevil, $30,000,000 in 1880. Since then this loss has decreased, but Texas in 1894 lost $8,000,000 by the boll weevil and $15,000,000 is considered a low annual estimate of its work on cotton. Tobacco gave up 8 per cent., or $2,000,000, to a horde of insects; potatoes, 6 per cent., or $10,000,000, to the Colorado potato beetle. No figures are given for fruits, truck, domestic animals, and timber.

SET THE HIVES APART.

We should much prefer to have each hive on a stand by itself, that in opening or removing one of the others may not be disturbed either by the jar, noise or excitement of the bees. The stands should be level from side to side of hive, and about an inch lower in front than back, which will allow any rain that beats into the entrance to drain out again quickly. A strip of plank raised upon four bricks may be high enough if there is no tall grass or weeds allowed to grow up in front—putting a strip of inch board upon the two bricks at the rear end if the ground is level. If they are placed in more than one row let each row be in the space between two hives in the row front of them. Where it is desirable to economize room, rows may be ten or twelve feet apart, and hives twenty and twenty-four inches apart, from side to side. We like to have the entrances face the east or southeast, particularly if they are to be wintered on the summer stands. It is well to have the hives shaded, both in spring to prevent too early a flight and in summer, to prevent any melting down of comb; but we do not want them set under apple trees. The jar from apples falling on the hive disturbs them and makes them cross.—American Cultivator.

The annual expenditures by the Chinese farmers in the Hawaiian islands for labor is $21.45 per acre; white farmers, $3.49 per acre; Japanese farmers, $3.65 per acre; and by the native farmers, 11 cents per acre.

BEEKEEPERS' MEETING.

The 14th annual convention of the California State Beekeepers' association will be held in the assembly room of the Chamber of Commerce, Los Angeles, on January 4th and 5th, 1904.

The program of the Glendora Farmers' Institute comes too late for publication, as the institute was held on the 30th. Committees having charge of these institutes should forward their programs at least two weeks preceding the date of the holding of the meetings.

The production of oranges in the United States amounts to 12,000,000 boxes per annum, of which 10,000,000 boxes are produced in California and 2,000,000 boxes in Florida. The consumption of lemons in the United States amounts to 3,000,000 cases per annum, of which 1,000,000 cases are produced in California, the remainder being imported.

GO TO GARDENA

Gardena is located in the center of the broad fertile valley between Los Angeles and San Pedro; has two electric lines giving the very best facilities for marketing products.

It is without rival in regard to climate, soil and water supply.

The soil is adapted to berries, alfalfa, vegetables, walnuts, etc.

To illustrate what can be done, we visited the model ten-acre ranch home of Messrs. Burge and Michael near Gardena. They kindly gave us an itemized statement of sales of produce for the year 1903. The walnuts (nearly 4 acres) were sold for $731.79; small fruits, vegetables, hay, chickens, eggs, cream, etc,, $818.77, making a total of $1,550 56. Can you ask for a better investment?

For Sale, 10 Acres, $4500

House of 6 rooms, barn, farming tools, hay in barn, 1 horse, chickens, etc. One acre in alfalfa, balance in orchard, mostly apricots. $2,000 cash, 6%, good time.

5 Acres, $2,000

Three acres young strawberries; balance alfalfa and garden. Horse, cow, buggy and farming implements.

5 Acres, $1,400

Two and one-half acres new strawberries,

20 Acres, $2500

One acre strawberries, 3 acres apple orchard; 7-room house; barn. Easy terms.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house' sheds, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house and barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

CITRUS STOCK

Season Navels Navelencias Valencia Lates **1904**

All stock two years old on four-year-old roots. First-class in every particular. Large, healthy, clean. No better anywhere. Write us for prices.

Mills & Masters

JAS. MILLS, Mgr. RIVERSIDE, CAL.

RIVERSIDE NURSERIES, Riverside, Cal. Fullerton, Cal., Oct. 24, 1903.

Dear Sirs—It is with no small degree of pride that I point to the orange orchard that I set out in June, 1902, with stock from your nurseries. I am not acquainted with any orchard of similar age that has done so well, and is today so promising. This certainly speaks in no uncertain language of the character of the stock coming from your nurseries. Very respectfully, CHARLES CHAPMAN.

WINTER TOMATOES.

A subscriber at Glendora writes for information regarding the growing and care of winter tomatoes. The tomato requires for its perfect growth a warm soil and a high temperature. These conditions are found in many of our foothill sections, continuing through the winter months, and in such sections it should prove a profitable crop. The seed for winter tomatoes should be sown about September or October, in shallow boxes of moderately rich soil. As soon as the plants are large enough they should be shifted to pots, and we have found the common splint berry boxes as good for this as anything. In these they can be allowed to remain until it is desired to transplant them in the permanent bed. In these boxes the plants have abundant root room, and can be left until they have attained a considerable size. By placing the berry boxes close together, the plants may be kept in a compact mass and are easily handled and cared for until they are large enough to set in the open. A light sandy loam is a desirable soil and this may be enriched with a compost of well rotted manure mixed with rich garden loam and a little wood ashes. The tomato requires from two to two and a half months from the time of sowing the seed to the period of bearing. Hence the seed sown in October should begin fruiting in December and for a continuous crop seed should be sown at different intervals. As is well known, the tomato is very susceptible to cold and will not stand the least touch of frost; it is, therefore, necessary to see that it has warmth and is well protected from changes in temperature. This protection can easily be accorded it in our frostless sections by providing a cover for it at night when the temperature is too low for its continuous growth and when, if the plant lives, it will receive a set-back that may check its bearing and defeat the object for which it is grown. A light covering which will prevent the radiation of the heat of the soil during the night is therefore an important necessity in the production of winter tomatoes, even in the most favored locations in our state. The treatment of the plants is practically the same in the winter as in the summer season, the conditions required being such as will insure steady and continuous growth and prevent any set-backs, from which it may take the plant a long time to recover, if it recover at all, continuous warmth, which the sun will furnish by day, and which can be conserved by covering on chilly nights, a rich soil, and not too much water; with these conditions supplied there is no reason why our correspondent should not have tomatoes on the market when they are profitable. In the colder eastern states it is found profitable to grow this crop in green houses, with all the cost and labor attendant thereon, while very poor tomatoes are brought into San Francisco during the winter months and command 25 cents a pound. At such prices it will pay those who have sheltered places to take a little pains with this crop.

* * *

Editor Cultivator: I have a two-year old vineyard, stocked with Tokay, Empress and Cornichon grapes, and wish to know how to set about pruning. Could you let me know through the Cultivator, how to proceed in each variety. Also how can one best propagate raspberries and dewberries.—Subscriber, Loomis, Cal.

The method of pruning Tokay grapes most common among experienced growers of this variety is to cut back to two good buds, not counting the small or aborted buds. The number of canes left on the vine is dependent upon the strength of the vine, and may be from two to six or more. On thrifty two-year vines three or four canes may be left. This is a matter that must be left largely to the judgment of the pruner, who should be able to estimate the strength of the vine and how much fruit it can successfully carry. Cornichon grapes will stand practically the same treatment. In the case of Emperors the practice is to leave longer canes and from four to six good buds are left.

Raspberries are propagated by suckers, or offsets springing up from the main roots. These are divided into single plants, and are planted in rows from three to four feet apart. The best soil for the raspberry is a rich, deep, moist loam, although it will do well on hillsides and at a considerable elevation. Dewberries are propagated in the same manner by division of the roots. They are also tip-rooters. The long canes bend over on to the ground and young plants will start from the tips of the canes. If the grower desires to help nature in this method of propagation he may place a handful of earth on the tips of the canes. The Loganberry is treated in the same manner.

After cleaning keep utensils inverted in pure air, and sun if possible, until wanted for use.

APRICOT BLIGHT.

Prof. Paddock, horticulturist of the Colorado Station, has been making experiments with blight of the apricot. It has been supposed that pear blight never attacked anything except pears, apples and quinces, but Prof. Paddock has proved that the young twigs and fruit of the apricot are very susceptible to the disease. Diseased tissue was taken from the apricot and examined under the microscope and the pear blight germs were recognized. Some of the same was used to inoculate apple and pear trees with the same result, as pear blight shows naturally. Pear blight germs were taken from affected pear trees, pure cultures made and used on apricot trees and fruit with the same result. The apricot trees that were discovered with the blight on the fruit and twigs were in a mixed orchard that contained pear and apple trees affected with the blight. All of this evidence goes to show that there is no doubt that the apricot has this disease to contend with.

The twigs show the disease just about as it is seen on apple and pear twigs. The outer bark turns dark and blends gradually into the healthy tissue. Drops of sticky fluid show on the shriveling twigs and leaf stems. The blight spots on the fruit are known by the flesh of the fruit turning dark and shriveling, and in time sinks so that the outline of the pit may be seen.

The remedy recommended, is to remove all twigs or branches of pears, apples, plums and apricots that show any sign of the disease. These should be removed whenever seen and special care should be used late in the fall in removing such parts of the trees. It has been proven that the germs of pear blight live over winter in the diseased tissues of these plants and when the sap starts to flow in the spring, a sweet gummy substance exudes from the affected parts. This is attractive to a great many insects and they convey the germs from such places to the blossoms of the trees. From these, it is spread broacast. In removing diseased twigs it is important to cut at least 8 inches below the points at which the disease shows. Of course all brush should be burned at once.

* * *

BUDDING PEACH TREES.

Editor Cultivator: I should like to know when is the best time of year to bud peach seedlings. I wish to propogate some choice varieties and should like to know the best time to do it; also, just which is the best time to plant the stones, fall or winter.—E. H. F., Los Angeles.

The peach pits should have been put down in sand early in the fall and kept wet all the time. The safest way is to dip the stones in a solution of bluestone and water, one pound to 10 gallons, spread them out about two or three inches deep on a bed of sand with good drainage. Place a double thickness of burlap over them, and over this about three inches of sand. The burlap should be dipped in the bluestone water also. Keep this sand wet all the time. Sprinkling it every other day will do it when it does not rain. Enough water should be used to wash through the seeds so as to remove the bluestone that might cling to them. Have your nursery ground ready early in the spring and when you see the peach stones cracking, pick them out and drop them in shallow furrows in the nursery rows. Place them about a foot apart and about the middle of July they should be as large as lead pencils, when they may be budded. As soon as the buds show unmistakable signs of having healed over well, cut the tops off about an inch above the buds. They will start to grow in a few days and by fall they should be about a foot to 18 inches high. These are known in the trade as June buds and are preferred to a yearling tree by a good many growers. We like them better as the roots are kept more intact in transplanting. The whole tree is smaller than a yearling, but if well grown, is plenty large enough to transplant well. If you prefer a yearling tree, but the seedlings in the fall and remove the tops in the spring when the trees begin to grow. The buds grow all the following season and a much larger tree is secured. All kinds of deciduous stock may be budded as described.

* * *

COLD STORAGE.

A subscriber wishes to know where he may get the best information on methods of cold storage, being especially interested in keeping late varieties of table grapes. We would refer him to Farmers' Bulletin No. 125. This gives reliable information on this subject and may be secured from the Department of Agriculture at Washington, D. C., without charge, by dropping a postal card to the Secretary of Agriculture.

* * *

RYE GRASSES.

Editor Cultivator: Will you please tell me the difference between Australian rye grass and Italian rye grass and where can I get seed in San Francisco?—Subscriber, Arroyo Grande.

There is little difference between the two kinds, both being known as Lolium perenne. There seems to be a "distinction without a difference" in these so-called two kinds of grasses. Tests at the experiment station show no difference in results. The seed may be secured from any of the seed firms in the state.

BY J. W. MILLS, ONTARIO, CAL.

SPLIT ORANGES.

Mr. Braunton calls our attention to the fact that in some instances, Washington Navel oranges split transversely or crosswise, thus proving that the navel has nothing to do with the splitting, but the apparent reason for them splitting at the navel in most cases is due to that point being the weakest spot in the orange. When the pressure of the expanding pulp overcomes the resistance of the rind, it breaks in the weakest part. This seems to be reasonable, and no doubt is accountable for much of the trouble, yet we have seen the navel part of the orange so ill-shapen that its power of resistance was very small and still would not split, while on the same tree, oranges with well shaped navels would split open. We cannot asservate with certainty that the split navels were weakened by any foreign growth, but we think that such is more often than not the case. Opposed to this theory is the fact that the navel will often start to split on the outside just as the skin sometimes splits half way around from the navel. Mr. Braunton's experience shows that under certain circumstances the navel has nothing to do with the splitting, while where the splitting is practically confined to the navel end, the navel at least allows the splitting to occur. It is a fact that the navel form in itself is not necessarily a point of weakness, if oranges having navels split in other places. Mr. Braunton says that the fact that splits occur on the sides, shows that the navel has nothing to do with the splitting, meaning, of course, that the primal cause lies deeper. There is, no doubt, a tendency towards splitting in every orange. We suggested that the navel cavity was an ideal place for the lodgment of germs that might weaken the rind at that point so that it could not resist the strain of the expanding pulp. We have examined a great number of split oranges and almost always found fungus growth at the point, but we could not tell if it started before or after the fruit split.

Mr. Braunton has kindly told us that he observed two orange orchards, one which suffered for water and afterward received an abundance with the result that a good percentage of the fruit split crosswise. The other orchard, situated on different soil, had received proper care and no fruit in it split. We would like our readers to write and tell us the results of their observations. It makes no difference whose toes get stepped on. It is a question of oranges, not toes.

OVER 10,000 CIRCULATION.

We are exceedingly pleased to know that the California Cultivator has outstripped every other agricultural paper on the coast, being the first to pass the 10,000 mark in circulation. We are proud to know that we are one of the staff and that we have been able to keep up with the procession, thanks to our numerous kind friends. We have been a reader of the Cultivator for the past ten years and shall continue to be one as long as we are interested in farm or garden work.

RESISTANT GRAPE VINES

We are, and have been for some time, large growers of Resistant Grape Vines. Write for quotations on resistant grape vines grafted to the leading varieties of table and wine grapes. We shall be glad to supply you this season with anything you may want in the grape vine line. You will find our stock right and the prices right.

NO EXCEPTION

Last year we said the Tilton Apricot was a regular bearer. NEVER FAILS. This year is no exception. Every tree bore heavily; old ones as well as the newer planted orchards.

Fifteen Years' Test
and still the
TILTON APRICOT

Is a winner. Large, highly flavored, good color. In the dried fruits the Tilton won First Premium at the Great Central California Fair. Liked by canners. Original tree 18 years old near our nursery. Buy trees where you can get true to name buds from original stock from the Original Tilton Nurseryman. A thrifty lot of peaches and other deciduous trees.

J. W. BAIRSTOW, HANFORD, CAL.

A. B. C. OF INSECTS.

As an introduction this week, I wish to speak of a little talk with a prominent orchardist who I think has been president of a club and who stands among the first in his neighborhood. I met him in Los Angeles. He said,"Do you know that those articles in the Cultivator on insects, are just what I have been wanting for years? I am saving up the papers and shall read them over and over. They make me hungry to know more," and he asked for the best book on entomology. I have had several comments of like nature from men of like standing, and so I am bold to keep up these articles despite the criticism of a good friend that they are pretty heavy and he fears the readers of the Cultivator will tire of them. Is it not true that the more the orchardist knows of his business the more surely he may look for success? What touches his interests with more power to injure that do his insect enemies. If this is true, how can the wide awake orchardist tire of such articles. I will compromise however, by making the conclusion as brief as possible.

* * *

Fig. 5

Tineid Moths.—These moths are very properly called Micro-Lepidoptera. They are very small and are familiar to us in the clothes moth. Most of the caterpillars feed on leaves and are often leaf miners. The ones most important to us are the clothes moths, of which there are two or three species. Owing to our warm climate, they are very apt to work havoc upon our woolen goods. This is one reason why I prefer rugs to carpets. If the rugs are dusted and hung in the sun once a month the thorough beating will almost surely prevent moth ravages. Woolen goods, not in use, kept in close trunks or drawers with plenty of moth balls are pretty safe. Any clothing affected as also upholstered furniture should be thoroughly treated either with bi-sulphide of carbon, or gasoline. It is well to remember that these substances are inflammable and somewhat explosive and so great pains must be taken to avoid any fire. It will be observed that the remedies are the same as for the carpet beetle—the so-called buffalo moth.

* * *

Tortricid Moths.—These moths, familiar to us in the codling moth and the orange moth, are so named from their leaf rolling habit. Most of them feed on leaves, which they wrap about them as they feed, fastening the same with thread. Of course, as with all Lepidoptera, they do their feeding as larvae or caterpillars. As stated in the last Cultivator, the orange caterpillar will probably never do us any serious harm. The codling moth, however, is a very serious pest where apples and pears are grown. As I proved several years ago, Paris green may be made very effective against this moth. Professors Clark and Woodworth have again gone over the ground, the past season. They find, as I found years ago, that a faithful use of Paris green may be made very effective against the insects. The points I urged then were, a good article, one pound to two hundred gallons of water, with four or five pounds of lime added, to prevent burning of the foliage, keeping all thoroughly stirred, and very thorough application, which is much more likely to be accomplished if a power sprayer is used. Prof. Woodworth would advise three or four applications in a season. From my elaborate experiments made in Michigan I am convinced that if all would use this method, very soon one application or two at the most would be all that would be required. The one application should be made three or four weeks after the trees are in full blossom. It is a mistake to spray too early. Prof. Woodworth has done good work this year. It is to be hoped all apple and pear growers will thoroughly study his bulletin and most inportant that all follow his suggestions.

* * *

Noctuid Moths—These are the sober colored night flying moths. We are familiar with them in the cut worm and army worm moths. This year they have bled our alfalfa growers to the tune of thousands of dollars. While the Tineids and the Tortricids all pupate in silken cocoons, these night fliers pupate in the ground. The caterpillars, like most others, have sixteen legs and are great feeders. Fortunately, they are so preyed upon by parasites and predacious beetles that they rarely do much harm. Occasionally their enemies seen off duty, when, as in the past season, they come forth in armies and work fearful havoc. It is hard to combat them. Poisoning bunches of grass with Paris green has given some relief. Where insects come in such overwhelming numbers, the problem of theis destruction is not an easy one to solve.

* * *

The Geometride—These moths are very delicate thin winged species; the caterpillars have ten legs and so are loopers or measuring worms. They pupate in the ground but also envelope themselves in a slight silken cocoon. In the north of our state, the canker worm is an unfortunate illustration of this family. They are grievous pests in the deciduous orchards. I had much experience with these canker worms in the East and I never failed to undo them with Paris green, used as I recommended above for the codling moth. As the females are wingless, these insects do not spread rapidly and concerted action on the part of the fruit grower would soon lead to extermination. As yet so far as I know we have not this enemy in Southern California.

In the next number I will complete the study of moths and butterflies, after which I will briefly treat of the most wonderful order of all, the Hymenoptera, which includes bees and the related insects.

* * *

STABLE FERTILIZER.

I had the pleasure of a considerable car ride the past week with one of our most advanced citrus growers. He has used commercial fertilizers not a little and while at first he seemed to get immediate and most surprising results, his success was not continuous. Indeed, he feels that his soil may have been injured, for the trees have even seemed to go into a decline and are disappointing in their product. He used not a little treated phosphate rock and wonders of the sulphuric acid could possibly work to the injuring of the soil. Experiments with his lawn seemed rather to sustain this opinion. I wondered if his stimulation of the trees to such excessive fruitage may not be one cause of the set back. I find our football men after playing a magnificent game are not ready to play a second game until after a considerable period of rest. They are pushed to their hard game by the enthusiasm of friends and spectators. May not excessive use of commercial fertilizer in readily available form be the enthusiasm which pushes the citrus orchard to undue exertion. I only give this as a hint.

As I told my friend in this conversation, the most of our citrus growers who have made marked success in their orchards have used a large amount of stable fertilizer. I believe that the humus thus added to the soil is one of the things that we must have to secure the best results. Our soils are poor in this material. It is very likely that an oversupply of this fertilizer may result in coarse fruit, though I am far from sure that this has been entirely proved. It may be however that a large amount of stable manure may produce such an excellent condition of the soil that an excessive growth would result, and coarse fruit be produced. While then, it may be well not to crowd the orchard too heavily, even with stable fertilizer, I believe it is safe to use a goodly amount and then, I believe it is equally wise to add a not excessive amount of treated bone meal.

* * *

My friend agreed with me that stable fertilizer when of good quality was excellent for the orchard, but complained that it was not easy to get and was somewhat expensive. I asked him why he did not practice the green manuring, as I knew he had not done so. He said he tried some years ago but with indifferent success. The peas did not seem to do well. This was, however, before the inoculation theory was made prominent. His neighbors were now growing fine crops and he expected next year to try peas again. It will be remembered that I have nrged for several years, in the Cultivator, that we decide once for all what green crop we shall use, then adhere to this crop that we may be sure to have our soil replete with the specific bacteria necessary to the successful growing of the crop. This is why I have always urged the planting of the Canadian field pea as I knew that to be one of the best crops that could be grown. If it is true,as I reported that fenugreek grows more vigorously and produces more herbage and that it is visited by the same bacteria that work on our common burr clover and which is abundant in all our soils, then possibly fenugreek may take the place of peas. Several are working in this line and we shall soon know more definitely as to the exact status of this new plant and its value for green manuring.

* * *

DISTILLATE SPRAY.

I have two communications from Sacramento county, one from E. A. Gammon, Courtland, the other from M. N. Williamson, Sacramento. Both represent that a manufacturer of spraying machines from Southern California in his endeavor to sell machines in the north recommends distillate spray as a superior wash for codling moth, scab on pears and all fungus growth. Both parties ask me for advice in the matter. I strikes me the above savors altogether too strongly of the usual advertisements for proprietary medicines, with this difference that the patent medicine is often absolutely worthless and not infrequently harmful, while the distillate spray does have its virtues and substantial ones too. We do know that distillate spray is a cheap and excellent remedy for scale. We also know that it is very valuable in fighting the mites. But that it will prove effective against the codling moth, is doubtless absolutely without foundation.

* * *

GRANADILLA.

Subscriber asks if the Granadilla is subject to insect attack in this region and wishes to know whether the passion vine is a desirable climber for Southern California. The Granadilla is the large fruit of one of the passion vines, used and much prized in tropical countries for desserts. I have no doubt it would do well in our frostless regions though I do not know of its being grown. Our common blue and red passion flowers are both seriously injured by a common butterfly. The butterfly has rather narrow wings and is rich brown in color dotted with black spots. I presume this same caterpillar would work upon the Granadilla passion flower as well as the others though it is possible it might not. The cut, illustrating this article, was from a drawing made by Mr. Ralph Haines, one of my students. It will enable any one to identify the passion vine butterfly. It is to be presumed that Paris green sprayed upon the vines would protect against this insect. Both our common passion vines are beautiful as climbers, though the fact of this butterfly makes their planting questionable. These vines were a great adornment of one of our Claremont houses a few years ago, but were entirely ruined by the caterpillars of this butterfly.

Coast News and Notes

BY R. A. DAGUE, ROOM 416, HEARST BUILDING, SAN FRANCISCO

HORTICULTURE.

Corona sent out 36 car loads of oranges and lemons to supply the holiday demand.

The Gregory Dried Fruit Packing Co., of Colton, is erecting a mammoth packing house.

A car load of 30,000 pounds of prunes was shipped to Sweden from Salem, Oregon, last week.

The Chamberlain Canning Co. of Bakersfield, having finished up on fruit, is now canning pumpkins.

The olive pickling plant of Yuba City, Sutter county, is, this winter, doing an extensive business.

A grower near Red Bluff received 10 cents per pound for his crop of 1500 pounds of Persian walnuts.

The vineyardists of Etiwanda are agitated over the importation of vines in their vicinity affected by phylloxera.

The apple growers of the Pajaro valley will ask the next Legislature to pass laws to prevent the offering for sale of wormy or scaly fruit.

Statistics recently completed show Santa Cruz county still in the lead as a producer of apples. That is the banner apple section of California.

The Minneapolis Horticultural Society offers $1000 for a seedling apple tree as hardy and prolific as the Duchess and as large in size as the Wealthy.

The Napa Valley Canning Company is about to begin the erection of a cannery 220 by 240 feet. They are now building a lot of cottages for their employes.

The walnut growers of Goleta, recently acting together, purchased and destroyed a five-acre grove of young walnut trees which were afflicted by walnut blight.

During the season just closed W. R. Keller, representing the Liebbardt Commission Company of Denver, bought and shipped 153 carloads of Pajaro valley apples.

The Santa Cruz mountain districts are becoming famous for raising fine grapes. The lowest price received for grapes from this locality sent east was $1155, while the average was $1681.

Tulare county will exhibit some oranges at St. Louis raised this year that measure 13¼ inches in circumference and weigh 18½ ounces. They were raised by Mr. Robinson, near Cottonwood.

The Department of Agriculture will send a representative from Washington to Riverside and vicinity, during January, to study the decay of oranges in transit. His report will be highly interesting.

Two hundred million of dollars are invested in the grape business in the United States. California supplies the people of this country with practically all the raisins they eat, about 100,000,000 pounds.

It is estimated that Rogue valley, Oregon, will this winter export apples to the value of $125,000. The best varieties sell for $1.00 to $1.50 per box. Pear shipments in the autumn reached 75 car loads, averaging $1.10 per box.

The orange crop of Placer county was harvested, sold and shipped. They brought from $1.00 to $2.00 a box more than the Florida oranges. Central California is making steady progress in orange raising.

"Well, I declare! Another Turkish atrocity."

"Rug, cigarette or massacre?"

Johnny—Say, pa, what is classical music?

His Father—Classical music, my son, is music that you can't whistle, and wouldn't if you could.

J. M. Sharp, a prominent walnut grower, says the walnut output of Ventura county for 1903 will be about 165 car loads of ten tons each, which will net the growers for No. 1 soft shells, about $240 per ton, and about $230 for standards.

A prominent Portland jobbing firm takes a pessimistic view of the prune market. They say: European demand for Italian prunes has been overestimated. We do not believe there will be over 50 cars going to Europe this year, and most of these will go to England. We do not know of a single car going to France.

The production of the Smyrna fig is engaging the attention of California fruit growers, especially in Fresno county. Two farmers of that county are planting 480 acres, now that it has been demonstrated that we can raise as fine a Smyrna fig as comes from Asia Minor. The first experiment in raising that fruit in California was made in 1890.

The Tulare Register, alluding to the fact that the office of County Horticultural Commissioner had been abolished in that county, says: "The large fruit growers will spray and otherwise care for their orchards without any suggestion from a horticultural commissioner, and it is not necessary that three men put in every working day in the year looking after minor interests."

AGRICULTURE.

Seeding in Sutter county is about finished.

For two or three weeks past one and two carloads of hay have been shipped daily from Tulare to Los Angeles.

Senator Foraker, of Ohio, insists that sugar and tobacco should be admitted into the United States free of duty.

The Napa asylum raised in the last fiscal year $19,581 worth of farm products and the Mendocino asylum $9914 worth.

The Union Sugar Factory of Santa Maria closed down about the 20th ult., after a successful season. The company have under consideration the laying out of a townsite near the factory.

San Bernardino asylum for the insane during the last fiscal year produced $26,000 worth of farm and dairy products. Of this sum alfalfa stands for $2400, oranges for $3250, and milk $7500.

There has been for the past two weeks about seven car loads of cabbages shipped to the East daily from the 350 acre farm of Capt. R. S. Thornton and neighboring farms, nine miles south of San Francisco.

A few months ago a factory was erected in Louisiana for the manufacture of cattle food from molasses. The molasses is mixed with corn or oats, then pressed into a solid mass and dried, then ground into meal. Both cattle and horses like it and get fat on it.

A contention has arisen between the alfalfa growers and bee-keepers in Nevada, where large quantities of honey are raised. The alfalfa men say that the bees rob the grass of a heavy per

cent of nutriment. They will ask the next Legislature to protect them from this robbery by the bees. The bee men scoff at this, and contend that alfalfa and clover will not develop properly unless there are honey bees or bumble bees in the vicinity. The bee men are supported by the scientific agriculturists.

LIVE STOCK.

The co-operative creamery of Tulare pays out monthly from $6500 to $7000 for cream.

E. G. Wharton has bought, in Oswego county, New York, 16 head of registered Holstein-Friesian cattle for his ranch in Tulare county.

J. La Franchi owns 500 acres of a dairy farm in Napa county. During the summer he produces fifty-five rolls of butter per week. In the winter about 65 per week.

The Sacramento Valley Development Association is working hard to have a beet sugar factory established in the valley, and the prospects are bright for the success of their efforts.

The dairy product of California amounts to from $18,000,000 to $20,000,000 annually, and the industry is in its infancy. This state is destined in time to lead the Union in dairying.

MISCELLANEOUS.

The new directory of Fresno has been issued, showing a population of 19,215.

Freight charges on flour to the Orient have been cut from $3.00 to $1.00 per ton.

Many scores of ship are still lying idle in San Francisco bay awaiting engagements to carry freight.

An automobile stage service will soon be established between Ventura and Nordhoff, a distance of 16 miles.

The deep gas well of Ventura is now down 500 feet. Four shallow wells are now supplying the town with natural gas.

Santa Clara county will build a $3000 home—30 by 50 feet—at the St. Louis exposition in which to make their exhibits.

There is a fight on between the Pacific Coast lumbermen. Consumers of lumber will rejoice if it brings down the present excessively high prices.

The Farmers' Institue held this week at Pasadena has drawn a large audience and the discussion of farm topics has been exceedingly interesting.

Of the world's hay crop the United States grows 28,600,000 pounds. This is about half as much as Germany and about two-thirds as much as England.

In July, August, September and October the Southern Pacific earned $32,753,907. Deducting operating expenses and taxes the net income for the four months was $10,828,757.

The Supreme Court has decided that a tax for common school purposes must be levied separately from the tax for high schools, in municipalities having more than 1000 inhabitants.

Recently the lighting business of San Francisco passed into the hands of a single company, and now comes the complaint from the consumers that the quality of the gas is much inferior.

President Roosevelt has signed a proclamation announcing that the Government has acquired, from private owners, 44,000 acres of land east of Santa Barbara, and made the tract a forest reserve.

It is said H. E. Huntington is contemplating building an electric road from Bakersfield through Fresno and Stockton to San Francisco. That accomplished, he will have a line from San Francisco to Los Angeles.

The Overland Auto-Traction Company has been formed to operate automobiles between Waco and Paso Robles, a distance of 85 miles. They will carry freight, passengers and mail at about one-third the railroad fare.

Returns to the chief of the bureau of statistics of the department of agriculture indicate that the newly seeded area of winter wheat is about 32,000,000 acres, a decrease of 6 per cent. from the area estimated to have been sown in the fall of 1902.

Many large ranches are being cut up into small ones in the Sacramento valley, but Senator Diggs is urging other owners of large tracts who are still holding on to their broad acres to subdivide and sell small farms to eastern farmers coming in.

Charles McHenry, of Indiana, after a thorough study of California, gives it as his opinion that Alameda is the ideal county. Its climate is not excelled; its soil is productive; it receives each year enough rain fall and not too much, and as a fruit producer it is splendid.

The California Promotion Committee reports that settlers are flocking to this state in large numbers. Many whole colonies are coming in a body from Illinois, Ohio Nebraska, Minnesota and other states. Merced county has gained in a few months over 1000 easterners.

The Pueblo and Beulah electric railroad company of Colorado announces that, beginning at an early date, they will charge passengers 1½ cents per pound. Every one as he goes up to buy a ticket will step onto a platform, and automatic scales will instantly indicate to the ticket seller his weight.

Much irrigation is carried on in San Joaquin valley. It costs about 65 cents per acre per annum. Land values range from $3.00 to $15, without irrigation; alfalfa lands, $25.00 to $50; orange, vineyard and orchard lands (unimproved), with irrigation, from $60 to $100. Irrigated improved farms from $250.00 to $500 per acre.

C. M. Wooster, a director of our State Board of Trade, is an ardent advocate of irrigation. He recently stated that "three million acres in wheat and barley, nonirrigated, last year produced commercially $22,000,000, while the product of 300,000 acres of irrigated land sold for $30,000,000—a very great contrast."

A. D. Pryal, of Alameda county, an intelligent farmer who was awarded a gold medal by the State Agricultural society for hybridized potatoes, says the life of a potato is 14 years. After that it will cease to multiply. Mr. Pryal says the Early Rose, the Peach Blow, and the Burbank have about run their course. A new potato must be produced. Mr. Pryal claims he has succeeded in producing a new variety.

Sacramento county and the municipalities of Long Beach and Vacaville have been sued for an alleged violation of the "Mattern" patent for applying oil to public highways. The Municipal League of the State will ask many, if not all, the counties in California to help to fight this suit, for if the plaintiffs win oil cannot be used on the roads without costing the people many millions in buying the right to apply it.

A villainous trick was discovered and exposed by the fish and game commissioners of Alameda county. Parties caught large quantities of wild ducks in nets in shallow waters and the birds were drowned. Then the owners of the nets, once in 24 or 36 hours, would haul them to shore, and puncture them with wire so the buyers would suppose they had been shot. Some of these dead birds were marketed before the trick was discovered.

C. H. SESSIONS, ASSOCIATE EDITOR

PICA, OR DEPRAVED APPETITE.

Editor Cultivator: What is it a cow needs when she will eat harness, or leather of any kind, if left within reach? It is not salt, for cows in this section will not eat salt owing, I presume, to the salt fogs that come in from the ocean.—N. E. M.

Put three tablespoonfuls of powdered charcoal in her feed twice a day and place a piece of rock salt where she can lick it at will.

THE DAIRY AND THE ORCHARD.

I need make no apology for bringing this subject to the attention of our readers once more. Stable manure is very desirable in the orchard. True, we can get it at Los Angeles, but it is costly to do so and we cannot know of its value. So much depends upon the feed which the animals had which produced it and the method by which it has been preserved. If the orchardist feeds his own cattle, he can remove both these question marks at one and the same time. Indeed it will pay him best to feed his cattle well, and, if as I believe, the best way to manage the fertilizer is to draw and spread it at once on the orchard, then this method will be pursued as by far the most economical way of handling the stable fertilizers. I know now of three or four who are following this course and every one is enthusiastic regarding it.

May I offer a few suggestions in the hope to aid others who may adopt this policy which I believe is to become more and more common. Be sure to purchase cattle that will give large returns. I should not be satisfied with an animal that would not produce on an average of 20 pounds of milk a day for the entire year. It is also wise to think well and plan well in building barns or sheds for the cattle. Three points must be considered. Comfort of the animal, economy of labor in their care, and such arrangments as shall conserve all of the manure. The liquid manure as well as the solid must not go to waste. It is not difficult nor costly to arrange for all this. One gentelman of Upland who is carrying this suggestion into practice claims good profit aside from the fertilizer and thus an excellent manure is secured as we might say free of cost.—A. J. Cook.

AMERICAN HORSES.

The importation of the American horse into France has become quite extensive. Besides the large numbers purchased for the French army, the introduction of American agricultural machinery into France has created a demand for the horse on the farms, the larger part of which America supplies.

NEED OF STATE ASSOCIATION

The live stock breeders of this State have long felt the necessity of an association to protect and forward their interests. Especially has this been true as the stock interests have increased to proportions which render an association of breeders most valuable to all growers. At the State Fair this year this matter was taken up and has assumed practical form. Local associations are being formed which are auxiliary, or will be, to a State organization. It is a good sign that stockmen are awake to their interests and have made the effort to create an organization which will be of great value to them in the future.

A circular just issued by the United States department of agriculture states that a considerable part of the lamb and mutton handled by the great packing houses and by wholesalers and retailers all over the country is nothing in the world but goat, common goat, the department experts term it.

A clean skin is conducive to horse health as it is to man health.

If the foundation of the stable is getting out of condition, you should fix it at once and prevent its recurrence. The foot is the foundation of the horse in the stable, and its condition must be kept good or there may as well be no horse there.

Variety of food is good for horses, but variety of hours for feeding it is very bad.

Pay $3000 for a stallion if you want to, but first be sure that you can't buy as good a one for a deal less money.

The good horse brings a good price, and good care with intelligent instruction goes a long way toward making the good horse.

Do not couple sire and dam of opposite types or form and expect a symmetrical market-topping colt.

* * *

A handful of hay twisted hard and tight
Is a good horse brush if wielded with might.

* * *

A good nervous system gives vital power, spirit and prompt action without the use of the whip.

Low at the flanks, with narrow space between the ribs and hip. The legs must be well set under the body, front and rear. A mild, full eye is a sign of good disposition.

A straight face line, thin, large nostrils, low windpipe, are all signs of desirable qualities.—Exchange.

DARK HONEY.

British Bee Journal: With regard to very dark or black honey, of which I have, along with many others, a good quantity on hand this season, it may interest you to know that I gave a bottle of quite black honey to a friend of mine to experiment with, with the object of removing the blackness. He subjected the bottle of honey for about three hours to ozone from an electric machine and returned it to me perfectly clear and bright. I have not gone very fully into the matter, but if in your opinion it would be of importance to the craft I would do so. I am told that the cost per hundred weight is trifling.

It would appear that the effect of the ozone is to cause all the black matter to rise to the surface and then it is skimmed off.

WHAT MILK RECORDS TEACH.

When we observe the various degrees of success attained by different farmers we are sometimes prone to think that a great deal of modern success is simply the result of "good luck," says a writer in the Kansas Farmer. Yet a more thorough study of the methods of the successful farmer reveals in him an essential qualification not possessed by those who are less prosperous. He allows himself to be governed by his previous experience. He observes the work done by various makes of machinery and under all circumstances. He seeds his ground with that seed which has produced the highest yield and best quality of grain. When his crop is ready to harvest he promptly harvests it and as promptly places it where it will be protected from damp weather. Thus by his close observation and by possessing the faculty of putting into practice that which experience has taught him was best, he has prospered where others have failed.

The dairyman, too, must, if he is to be successful, adhere to certain fixed methods. He, too, like the farmer, must be a close observer. He must necessarily weigh and record separately the milk of each individual cow. Further, he must test and record separately the test of each cow at least once per month. These records form a basis of study by which the dairyman is enabled to ascertain which of his cows are yielding him a profit, and at the same time to determine the unprofitable ones. A single month is not sufficient time to test the milking qualities of his cows. He must make a thorough investigation. His cows, like the machines of different makes, may show different results under different circumstances. One cow may give a large quantity of milk immediately after calving while another may prove a more persistent milker. One may produce the largest quantity of milk during the year, while the milk of another may be found to contain a higher per cent of butter fat. Again, one cow may produce more butter fat during the year, while another may produce it more cheaply and thus show a greater profit.

In choosing calves for the purpose of raising dairy cows, a study of the milk record may again be found beneficial. Careful invetsigations have shown that the milk producing qualities of the cow are to a great extent hereditary ,and therefore can be influenced by careful breeding. To obtain the best results, the dairyman should select the female progeny of those cows whose records for producing butter fat have been the best.

Again, by a close observation of the milk record the milk producing values of the different feeds have been determined. Cows are no longer "fed for beef and milk alike," but as nearly as practicable, are fed a balanced ration which has proven to give the best results. The results of any excitement among the dairy cows can be noted by a glance at the milk record. The use of a dog in driving, or even the loud and boisterous manner of the milkman is followed by a noticeable decrease in the flow of milk. Any sudden change in feed, in milkers, shelter, or care results in corresponding decrease in the amount of milk produced.

Half a century ago commercial dairying was practically unknown. Today we find dairying one of the most important and most profitable of industries. Doubtless the milk record occupies no small place as a factor in bringing about this marvelous change. Scientific investigations have been made for the purpose of establishing new and better methods of feeding and caring for the dairy cow. The success or failure of these experiments depended upon the influence on the milk record. If they proved to have the desired effect on the flow of milk they were put into practice, if not, they were cast aside. Thus by adopting the best and rejecting all other systems the yield of milk from the average dairy cows has been more than doubled. And yet progress in the dairy industry has not ceased. Increased efforts are being put forth for further advancement it is generally believed that many lessons are yet to be learned by watching the milk record.

ABOUT CALVES.

C. A. Styles, a practical dairyman, writing of the calf and its care, says in the Farmer's Sentinel: "Don't tie calves up with a rope by their necks, or, worse still, shut them up in a rigid stanchion, but give them some freedom. Remember that they are like children, and are all the better for having exercise. At one year old is plenty early enough to put them in the kind of stalls you expect them to occupy when they become cows, and this, too, is more important than some people think. I have seen heifers that were not used to being confined in stanchions when they were young have an awful time getting used to this mode of fastening. The same thing occurs with cows that have been fastened with chains or straps. They never get used to any other way as well, so, I say, after the calf gets to be a yearling teach her to become accustomed to the mode of fastening you expect to use when she becomes a cow, and you will never regret it.

I have seen different ways of warming milk for feeding calves—from pans on the stove to steam from the factory. Most people get the milk warmed by steam at the factory to feed in the morning. At night heat up one or two tea kettles of water and set it in the can or tub of milk, and it will warm more than you would think. Another way to warm the night's milk is to put the calves' milk in a large washtub and set the can you use to put your night milk in into this tub, and by the time you have finished milking ten cows the milk in the tub will be warmed for the calves.

No matter whether you keep two or fifty cows, part of these cows are better than the rest. The chances are that a good cow will raise a better calf than a poorer cow, so if you wish your herd to improve just raise the heifer calves from the best cows; but if you simply want your herd to increase, raise, as some people do everything, and then wonder why they have so many poor cows."

SHORT BUTTER WEIGHTS.

An Omaha dairy paper has been calling attention, of late, to the fact that butter put up by some dairies is short in weight. Creamery butter labeled, and sold by weight, should of course, holds out in the amount claimed. If it does not, the purchaser is the loser. But the grocer who sells short weight butter, not only lays himself liable to prosecution, but he will mighty soon find his trade going from him. He should test his scales and then weigh the butter, which comes to him from the creameries, and find out if it holds out in the amount claimed. There is too much short weight butter sold in the country, if we are to accept the complaints of the buyers. Butter is high enough at best, to be sold at full measure, but like sugar, it often falls short. In another column will be found an interesting article touching this subject especially to grocers who handle creamery butter.

HEALING BARBED WIRE CUTS.

The treatment best suited to such cuts, which are of frequent occurrence in horses, inclosed with barbed wire fences, will vary, of course, with the nature of the wound. If the wound causes the loss of much blood, the first aim of the owner should be to stanch the bleeding. The ease or difficulty at tending this part of the treatment will depend largely on the location and character of the injury. In some instances it can only be done by the veterinarian. In other instances, however, the owner may do much toward staying the flow of blood. Where a thread or string can be tied so as to compress the ruptured vessel above or below the wound, according as the flow comes from a vein or an artery, the object sought will be secured. The blood flowing from an artery is scarlet in color, and frequently comes in jets, while that coming from veins is darker colored and oozes from the wound rather than coming in spurts. Where the bleeding is less copious, it may sometimes be stopped by applying an astringent preparation, such as powdered alum, which becomes effective through contracting the tissues, which has the effect of closing up the blood vessels. In other instances, flour, cobwebs, or dust have been used, and while they may prove effective in stopping the flow of blood, their presence may work injury and hinder healing. Of course, searing with a hot iron will also be effective, where the blood flow is not so copious. When the bleeding is stayed the wound should be washed. If of a character to justify it, it

should be stitched together, and if not, no further treatment is required. Healing will be accomplished more quickly in the absence of applications than in their presence, although in some instances an application may be helpful if it has the effect of keeping flies away from the wound.—The Farmer.

PROFIT FROM THE DAIRY.

Much of the success of the average farmer and dairyman depends on the cost of feeding the cows. There are conditions under which it is profitable to conduct a dairy and depend largely on purchased feed, but most farmers are finding their profits from home-grown feeds. As a rule, the more feed we grow on a farm, the more profit we make from our dairy work. It is difficult to raise the price of the product in the market, but we can often increase our profits by cheapening the cost of production. The most of us are buying too much grain feed while our farms are not producing more than half of what they might be made to yield under better management.

Under conditions as they exist in most sections of the country, feed can be grown more cheaply than it can be bought.

We have learned that some things are not so. It is not true that cows require a scientifically balanced ration to prove profitable. We know that the high amount of protein called for in the balanced ration of the scientists is not a practical necessity. It is easier to buy feed than to grow it, hence we buy. Is it not time that we stopped looking for an easy job and began looking for a profitable one? We need cheaper cow feed; we can get them by growing them. One of the most practical and successful dairymen in Maine has succeeded in reducing the annual cost of keeping his cows to $15 a head. This does not include the labor of feeding and caring for the cows, but is the actual cost of the food consumed when all grown upon the farm. Here, then, is the keynote of success in the feeding problem. What this man has done others can do if they will.

We have depended too much on hay and purchased grain for feeding our domestic animals of all kinds. There are crops that yield more feed at less cost than the hay crop. Many of these crops are as easy to grow as the hay crop, yet we cling to the old habit, and neglect to grow them, all the while knowing we might do better if only we would. Oats, corn, Hungarian oats, peas, sweet corn and many other things are all good and profitable. While the limits of this articles will not permit a discussion of their merits, it may be stated as a fact that it will prove more profitable to grow and feed any or all of them than to buy the same food value in the market.

Supplement the pasture with sweet corn next year if you want to know what a cream maker it is. Fill the silo with well-matured corn. Grow five acres of peas and oats, and cut when well-matured, but not fully ripe, and feed unthrashed. This feed will make more cream or butter than the best clover hay that ever grew; besides, it is much easier to grow and more convenient to cure and handle.—Tribune Farmer.

Wash the milk bucket in cold or tepid water before scalding. Soda added to the washing water makes it more effective.

Clean pastures make clean feed, and clean feed makes sweet milk and cream, and these make nice, sweet butter. Try it.

GROOMING DAIRY COWS.

Have regular hours for grooming your cows. Many people do not realize the importance of giving cows a thorough brushing every day. Often I have seen the flanks covered with a coat of dried excrement. Every motion the cow makes disloges some of this filth. Every time she switches her tail during milking, every motion of her legs, and every rub and brush of her body by the milker dislodges particles of this material which is sure to fall into the milk pail. All of this filth is crowded with bacteria (germs) in excessive numbers, and these find their way into the milk during the whole of the milking. Always moisten the udders with a damp cloth previous to milking, and a good brushing each day will keep the skin clear and healthy, prevent diseases, and well repay the labor bestowed, besides making the cows more comfortable and contented. A stiff brush made of broom corn is best.—Up-toDate Farmer.

CARE OF MILK.

The milk should be kept clean and wholesome by a system of safeguards observed during milking, in the milk house, and while the milk is in transit from dairy to consumer. The precautions observed during milking should be, special suits for milkers, careful washing of the hands after each cow is milked, milking into sterilized dairy pails after the cow's udders have been washed. The fore milk, as the first milk that is drawn is called, should be discarded and when the milk is drawn it should be taken to the milk house immediately.

The milk house should be separate from the milking barn and should be in charge of an attendant who should be attired in a special suit while handling the milk. It should be this person's duty to receive the milk from the milkers in order to avoid the necessity of the milkers entering the milk house. He should confine his work during milking hours exclusively to the milk house and should avoid going into the milking barn. In this way the milk house is isolated from any outside influences and in it the milk can be handled without much danger of becoming contaminated. The milk, being received from the milkers, is strained and cooled, after which it is bottled and prepared for shipment. Every utensil, such as pails, strainers, coolers, tanks and bottles, must be made scrupulously clean and sterile, if possible, by exposure to live steam under pressure. The milk house as well as the milking barn should be thoroughly ventiliated and no employe of the dairy should be permitted to enter them, other than the regular attendants who milk and handle the milk.

The well equipped dairy should also have apparatus on hand so the milk of each individual cow can be periodically examined to determine if she is giving proper returns for the amount of feed she consumes. There is no animal that will give greater returns for feed consumed than the good dairy cow, consequently it should be the aim of every dairyman to first, procure good cows, and second, to give them first class feed judiciously mixed and supplied. Then if he follows out our suggestions regarding cleanliness in handling the milk, he will be able to place a product in the hands of the consumer that does not have to be "doped" with preservatives to keep it from souring, but he can guarantee this milk to remain sweet and wholesome for three or four days. Under present methods of producing milk, the producer is lucky if he can get his product into the hands of the consumer before it turns sour and unfit for use.—Dr. Archibald, in Live Stock and Dairy Journal.

NEW BLINDER FOR HORSES.

A folding blinder, which can be dropped down over the horse's eyes like a spring curtain by merely pulling a cord, has been invented by a Nebraskan as a means of controlling scary and vicious horses. The presence of the blind is never obtrusive when hidden away in a casing over the browband of the animal's bridle. The blinder comprises the casing or housing, curved to conform to the browband and fastened to the bridle by suitable straps. This contains a bellows-folding curtain or blind, which is normally held in place within the casing by means of spring clips. The curtain is operated by a cord secured to the lower ends of the curtain and passed through the bit rings and then back to the saddle or hip straps of the driving harness, within easy reach of the rider or driver. The moment this curtain is drawn down in front of the horse's eyes he becomes quieted and can be secured and led away from danger.

Don't think a cow giving very rich milk is always a good one.

Don't milk a cow before she calves.

Don't fail to learn by what is called "down in the bones" when a cow is close to calving.

Don't go to bed and trust to luck that she will calve all right.

Don't give cows much bulky food just before they calve.

Don't think a full udder distresses a cow as much as a full paunch.

WOMAN'S WORK IN THE POULTRY YARD.

"The price of eggs has been so high for the last three months, it is almost like eating gold" said a careful housekeeper to me a few days ago.

This is true from Maine to California, eggs are dearer than even before and the prospects for consumers are still gloomy, for there is a shortage of eggs all over the country and worse still, a shortage also of hens to lay them. With a few execptions the egg yield for the past two years has been less than usual and the fertility of the eggs in the eastern and middle states has been unusually poor. One correspondent writing, says: "out of 786 eggs set I hatched 168 and raised 112." Consequently there are less hens now than there were two years ago and unless we have a better season this spring we may expect a continuance of high prices.

"Why don't the hens lay, and why are the eggs unfertile?" asks a correspondent. I wish I could tell you. When I was a child we used to have occasionally a bad season, and as well as I can remember it was usually a wet summer that brought disaster to the chickens, and that may be one of the reasons for the poor fertility and unsatisfactory hatches east of the Rockies, but surely not here in our glorious climate. I read lately a very interesting article on the sun spots and the effect they have on the health of people and it occurred to me that we might lay it to the sun spots, especially as all the large poultrymen in the east are both perplexed and troubled and cannot decide what causes it nor how to remedy matters. One party suggests that we are now reaping one part of the results of forcing for eggs production, but I doubt this as the trouble has been all over the country and I am sure forcing for eggs has not been very general. The hens in the east have been on the strike and I am afraid they have sent some walking delegate here! One word about shipping fowls from the east—don't do it—get eggs if you must have an experiment with eastern fowls, I have tried it and so have some of my personal friends and found it a failure.

* * *

But to return to our subject, how are we to get fertile eggs and good hatches? I have hatched eggs successfully every month in the year in California, I did it as an experiment. I found the fertility greatest in March, April and May, lowest in December and January. I have had good strong hatches in October and even in the early part of November. I have had eggs cook under the poor hens in August, but I also raised a nice brood in August, but I found that pullets hatched in October began to lay as soon as those hatched in August and were more vigorous. So what was the use of having two extra months of care and feeding? I usually started my first incubator the first week in October. Had a good hatch, kept on hatching as fast as I had eggs after that. Always expected poor hatches in December and January, partly because I had just mated up and I found the newly mated did not always like their mates, partly because they were still making new feathers, and partly on account of sending them to the poultry show, it was so different to their own comfortable home, it tired them out and for at least two weeks they did not really recover and take to laying again.

I found also that when the male bird is moulting, or rather when his new feathers are sprouting, the eggs are very unfertile.

* * *

First let us decide that to have the eggs fertile the fowls must not be moulting, but must be in vigorous health, especially and particularly the male. Secondly they must have all the green food they need, that is at least half of their fare, if the yolk of the egg is light colored the fertility will be poor and the chicks will lack vigor. Green food is absolutely necessary for fertility.

One other reason for lack of fertility is a fault that can be remedied in the future and that is "over-crowding." Farm Poultry has an excellent article on "Don't bite off more than you can chew." It is so easy to set three or four incubators, and a big lot of little chicks look so cute; then you set the incubators again, and pretty soon you have machines just set, some half through, some hatching and chicks of all sizes everywhere, not to to mention feeding stock. It is more than you can handle; something is left undone—and, well, we all know the rest. My advice is "don't bite off more than you can chew."

If you go it alone do what you can and do it well. If you hire a man lay out for him only as much work as he can do, and do well, and insist on his doing it, and doing it well. Also to go a little farther treat your pocket book as recommended for the hired man or yourself. Don't for pity sake, "don't bite off more than your pocketbook can chew."

* * *

In mating for this season's breeding there are two things of great importance in the American class, and I usually write about those classes because although I have successfully raised thirteen or more other breeds, I consider the American breeds are the utility fowl for America. The two things in breeding I consider of great importance are size and vigor. It is my experience that weight tends to decline.

It is a simple matter to keep it up, only it cannot be left to take care of itself. As for vigor, it is easier to get this right than not. Cleanliness and exercise with healthy stock will give the requisite vigor.

Americans are recognized the world over as a business people. The American hen, too, is winning world-wide recognition.

ANSWER TO QUESTIONS

"Do you consider coal ashes sifted fine good for a dust bath for fowls? Will it injure the feathers?" Please reply through Cultivator.—A constant reader.

I do not like ashes for a dust bath, because the ashes absorb a great deal of the oil from the feathers and skin, rendering the feathers brittle and not glossy. An absolutely dry dust bath is not as good for fowls as one that is slightly moist. They will wallow in dry ashes when they have nothing better, but their choice is a slightly moist mixture of sand and loam. This removes dirt from both skin and feathers and keeps them in fine condition. It should always be borne in mind that the first function of the dust bath is for the general cleaning of the skin and plumage. The destruction of vermin is only an incident in the bathing process.

* * *

Editor Cultivator—Will the old saying, "Do as the Romans when in Rome," apply to chicken houses in Southern California. Ninety-nine out of one hundred of the chicken raisers in this section have open lath houses for their chickens and yet all the poultry journals advocate tight warm houses to prevent many of the chicken diseases.

An answer through your valued paper will be much appreciated by—N. E. M.

Doctors differ even in Southern California and poultry men also. I have been experimenting for several years with tight houses, houses open on one side, houses with top ventilation and with bottom ventilation and finally I think I have decided that the "mushroom" house is as well adapted to this climate as any. In fact I have sold out of the poultry business (on account of daughter's health) and have reserved only a dozen hens and two mushroom houses.

Fowl in this climate cannot stand a draught. They are sure to get cold from it, and the narrower the draught the more dangerous. Human beings in this climate also will soon be afflicted with neuralgia, earache, colds and rheumatism if subjected to a draught so with fowls it is the same, plenty of fresh air, but no draughts, not even a crack. If you do not like mushroom houses, I would advise a house open on one side, and let that one side be the west side, so the wind will not blow across them. Tight warm houses are not suitable for this climate.

Half-fed fowls never pay, whether kept for the table or to produce eggs. A fowl cannot get fat for table nor produce eggs on little or no food. A hen producing eggs will eat nearly twice as much as at any other time.

To feed poultry requires both judgment and constant attention; and since these are far from being general attainments among poultry men, hence the unsatisfactory state both for themselves and their fowls. I know of no other business in which the neglect of little things is so disastrous as in the poultry business.

WEALTH IN HENS AND EGGS.

Already the poultry products are greater than the output of the iron furnaces, twice the value of the wool clip, nearly four times the silver product, surpassing all other agricultural industries; is not this sufficient evidence that if the farmer's hen accomplishes so much under existing conditions, her usefulness would be nearly doubled by better breeding and more rational feeding. Suggestions to the considerate reader should suffice.—Farmer's Sentinel.

LICE ON POULTRY.

Dr. Smead, a well-known veterinarian in the New York Farmer, has the following about lice on poultry:

"Now, I am going to ask a question and answer it myself. Why is there any more sense in a hen being tormented with lice than a horse or any other animal? The answer is there is no more sense in one case than the other. The lice on every domesticated bird or beast we have no use for, and there is no sense in allowing them to exist. Now I am in it. I have got to tell how to get rid of the lice on the hen or own up and slink out. Well, I shan't slink out. A pound of pyrethrum powder (called also Persian insect powder) costs about 40 cents; a small hand bellows costs on the 10-cent counter of any store 10 cents. Thus we have a 50-cent outfit and lice killer enough to destroy as many lice as the proposed barge canal will cost the taxpayer dollars, and that is not a few. Now comes the worst feature of it all. The hen will have to be caught, and that means labor; and the hen labor most men abhor. Some, I know, have a horrible cold, or an awful lame arm, leg or back, every time the good wife suggests that the henhouse needs cleaning. It, as a rule, would not take 30 minutes' time once in two weeks; but it is such trying work that most men fear an attack of pneumonia or lumbago if they should tackle it. So it goes uncleaned, and the old hen spends a sleepless night from lice torment; has croup from the gases arising from her own dung, and gets cursed for not laying eggs and for leaving the nest before the chickens hatch. I am not applying this to your case; but am telling for some fellows I know. It is a little work, with a common sense application of the insect powder to the old hen that brings comfort to her and puts eggs in the nest. Yes, brings peace all around and profit in plenty.

"The old bird must be caught and the powder thoroughly dusted through her feathers—yes, thoroughly. I want the nail thoroughness driven into the brain of every man who thinks enough of this to try the prescription. Her wings must be raised and a puff and several puffs given of the powder right there. Yes, every part of her body must be saturated with the powder. In a week give her another powdering. There will be funerals in the louse family; but there will be happiness in the hen tribe; with a nearby crowing and cackling; with a full nest of eggs shortly to follow where none had been for weeks."

THE EGG AS FOOD.

The egg is a popular and a nutritious food of high value. The season for eggs runs from April 1 to July. The dullness in the fresh meat line at that period is the result of the egg and meat competition for the table. The extent of the spring competition of eggs with fresh meats may be gauged by the fact that from about the middle of March until June 15 there are about 750,000,000 eggs handled daily by the jobbers of the United States, says Poultry Review. For the season of 90 days named that would amount to 67,000,000 eggs. The egg season furnishes an overproduction for consumption. The surplus, however, finds its way into cold storage for fall and winter use.

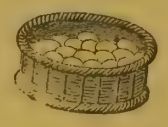
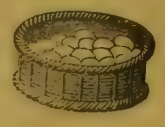
MIDLAND POULTRY FEED

Will make your fowls moult in one-half the time, which means they will lay that much sooner. "Laying fowls are paying fowls." You wlll not be disappointed at the results you get from feeding Midland Feed.





No. 4, Egg and Feather Producing Food

Is what you should feed your hens now, and the results you get will surprise you, for we know it will prove a paying investment. Our book, "The Science of Poultry Feeding," will tell you more about this feed. Send for it. It is FREE. Also

No. 1, Nursery Chick Food
No. 2, Growing Chick Food

We will be pleased to give you further information about this feed if you wish it. WRITE FOR PRICES.

The Only Reliable Balanced Ration for Poultry in the World.

These special foods are composed of the very best materials obtainable and as carefully and accurately mixed as it is possible to make them. They are a COMPLETE FOOD and will produce specific results, each for its purpose, and no other. We want you to become an established customer of ours. We want your trade, be it little or much. There is only one way we can secure it and that is by sending you material that will do what we claim for it.

The Midland Feed will cost you very little more than any good grain you now feed, and no more than you now expend for all the extras you must use in addition to your grain, and the results will be so far in excess of any previous experience you have had that you will readily acknowledge its value.

What the poultry man must be able to count on to a certainty is RESULTS.

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

A WORLD-FAMOUS AVENUE.

Editor Cultivator: The Home Improvement Society of Pomona is improving the streets of a certain part of the city. One of those streets, running east and west, is Fifth avenue, 100 feet wide, and the section to be improved is some three miles long.

There are now various trees planted, such as Montrey pines, peppers, umbrellas, etc. How should this organization proceed to secure best results, and if uniform planting is desirable, what tree is best?—S.

Oh, that the residents and owners of Fifth avenue, Pomona, realized what a privilege is theirs! In this case is presented an opportunity to make an avenue which, in a few years, would be known all over the coast, possibly in every state in the Union. Doubtless many of the members of the above organization are fully aware how sacred the trust reposed in them; would that each and every one were fired with the proper amount of zeal and energy to properly carry out this grand work. But space is valuable; though a whole issue of the Cultivator would be far from wasted could it be the means of procuring the proper planting of this avenue. The writer would like to fill a column with reasons why this planting should be uniform throughout, what to use and why, but it cannot be. We must "get down to hard pan."

The first step in the work is to bring the property owners along this street to a realization of the immense importance of the contemplated planting. This can probably best be done by calling a public meeting for the purpose, have stirring addresses from good talkers who are interested. Enthusiasm counts for everything in this work. Every property owner, more especially those whose property already has street trees, should be won over. All existing trees should be taken out and the avenue planted for the whole distance with one kind of tree. After thoroughly discussing the different trees, a vote should be taken (by the property owners only) and the tree receiving the highest number of votes should be used. If this is found impossible, agree upon another one. It is not so essential that any certain tree should be used as it is that there be but one kind planted. (Read this department in the issue of December 11th.)

* * *

In the writer's estimation the live (Quercus agrifolia) is decidedly the best tree to use; they can easily be procured at reasonable cost and as they need to be planted far apart the total cost will not be great. I have before me a quotation of oaks eight to fourteen inches high, in three and four-inch pots, at twenty-five dollars per hundred. Three miles of street with a tree on each side every fifty feet would take, with a few extras for replacing, six hundred and fifty trees, at a cost of one hundred and sixty-two dollars and fifty cents. In such large quantities they can, no doubt, be bought for less.

Oaks should not be planted closer than forty feet apart, fifty is better, with the trees on the street where the lines of fifty feet lots would intersect; between these could be planted something for temporary effect, or two flowering shrubs, like the crepe myrtles. These could be taken out when they interfere with the oaks, though many years would elapse ere it became necessary.

Many people think, because the oak, in its native habitat, is slow of growth, that it is necessarily so, but such is not the case. If properly planted, and left to themselves, they will double their wild growth; and, if properly watered, will grow ten times as fast as under natural conditions only. In such an important plantation it could, no doubt, be easily arranged to give them a uniform watering from one to three times each summer for two or three years.

The writer would reserve making an absolute second choice unless he could view the scene, examine the soil, etc. The Victorian bottle tree would, no doubt, prove very satisfactory, perhaps the next best. If not the bottle tree, an acacia or eucalypt would better be used, unless a deciduous tree is wanted, which would not be proper in this climate. There are many trees which would do finely, but are not available in sufficient quantities. The writer would like to keep in touch with this matter either through this department or by correspondence.

NEW KINDS OF VEGETABLES.

The Department of Agriculture is making experiments with many new vegetables which are expected to prove useful to this country, if the people can be persuaded to grow them, says the San Jose Mercury. Its explorers are fetching them from various parts of the world, especially from Mexico, which is known to possess many food plants that would be of much value if introduced into the United States.

Among the available Mexican vegetbles are various kinds of peppers and several species of tomatoes which are unknown to us. For example, there is the "husk tomato," which is about the size of a horse-chestnut, and is contained in a sort of detachable rind that is removed when the fruit is ripe, as a preliminary to cooking it. It is not good raw, but is said to be excellent when stewed or fried. The Mexicans preserve it as a sweet pickle.

Then there is a brand-new kind of cucumber, which is quite an oddity in its way, inasmuch as it explodes with a loud report when ripe, throwing its red seeds to a distance. Its chief use is as a medicine, but the vine on which it grows is so handsome as to be desirable for gardens. More valuable is a giant okra, lately obtained from Europe, which has pods five or six times the ordinary size. Soon, doubtless, it will be commonly grown in this country, and will be obtainable in our markets. It has a delightful flavor.

Another European vegetable which Uncle Sam wants to introduce is the tuber of a plant that looks a good deal like marsh grass. It is only about as big as a hazel nut, and when eaten raw resembles cocoanut in flavor. This is called "chervil," and may be cooked in a variety of ways. The plant is a kind of sedge.

Special attention is being paid to the cultivation of new pot herbs on the experimental farm which the government maintains near Washington, and the seeds of the best of these, when a sufficient supply has been obtained, will be distributed to farmers and gardeners. Notable among them is a plant from India, called "basella," which bears fruit that looks like little blackberries. It is a vine, has pink blossoms resembling those of the arbutus, and is said to be delicious.

It is always difficult to persuade people to eat new things—a fact of which the common tomato, which a generation ago was considered poisonous in New England, affords a familiar illustration. Nevertheless, every new vegetable is an important addition to our happiness and welfare, and even a novelty in the way of a pot herb is a contribution not to be despised by those who appreciate a well-flavored plate of soup or dish of stew.

ZANTE CURRANTS.

Zante currants, insignificant as they may seem, are just now making a great stir in the world. The peasants of Southwestern Greece, where most of the currants are grown, are almost in revolt because the government delays granting to a certain company the exclusive control of the growing, gathering and selling of the fruit. They believe that the living of the currant-growers depends upon this monopoly, which seems to reverse the order of things as they are in this country. And, strange to say, it was only recently that these currants made a stir in quite another way. A disease of the vines made necessary the use of so much sulphate of copper in spraying them that the scarcity of that chemical seriously affected the price of electrical fittings everywhere, for the fittings must have the sulphate.

PRUNING GRAPE VINES.

(Continued from first page)

half-long canes should be tied up to something or the load of fruit will be liable to break them off. If the vines are well balanced, they may be tied together, but if the vines are lopsided, they may be tied to a stake. Some varieties do not require more than three buds, though the quality of the soil determines this to considerable extent. For instance, Malaga does well with about four buds on ordinary sandy soil, but if it is planted on rich land, it will require more buds.

There are some varieties of grapes that require canes that vary from six buds in length to the entire length of the canes. The reason often is, that the buds sent out within a foot or so of their base do not produce fruiting wood. It is therefore imperative that the canes be left long. This is the third style of pruning and is done on the same principle as the half long, except that the canes are left entire or are cut back very little, and the spurs left at the base are given two buds instead of one. Reference to Fig. VI gives the idea.

* * *

If long pruned canes are tied up straight, the chief object in long pruning will be lost, for the buds near the top will make a vigorous growth and the buds lower down will not start. If the canes are bent in the shape of a hoop or even extended horizontally, the flow of sap will be retarded and all or most of the buds along the cane will send out shoots that will include the bearing wood. Fig. VII shows the method. Fig. VIII shows the method of training the canes on horizontal wires. The stake is convenient to tie the growth to that comes up from the spurs. This allows the tops to be cut from the fruiting canes if it is desired to thicken the shade or get rid of the surplus growth which draws on the fruiting energy of the vines. In any event, a rather short bend should be made at the base of the cane so as to retard the flow of sap, which has a tendency to promote fruitfulness. When the vines are tied up to a stake, this is best accomplished by tying the ends of the canes first down near the crown of the vine and then press down on the bows and tie them to the stake.

* * *

The remaining three styles of pruning are the same as those just described, except that instead of a perpendicular trunk with one head, there are several heads or crowns on a horizontal trunk. The start at the first year is the same as with the other methods of pruning, but ultimately, each vine should reach the adjoining one as shown in Fig. IX. Buds are selected at intervals of a foot or so, with which

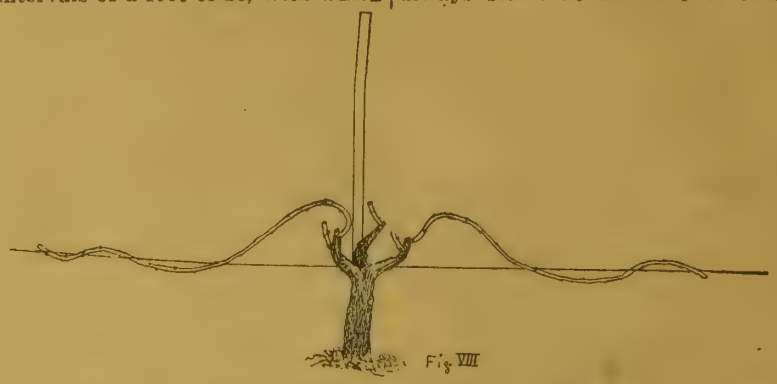

Fig VIII

to start individual heads. Some varieties require short pruning on these individual heads, others require half-long and still others long pruning. It is necessary to train vines on wires as shown in Fig. IX, when the trunks are trained in a horizontal direction. For short pruning on such a vine, but one wire is necessary and it should be about 18 inches from the ground. When half-long or long pruning is practiced, two wires are required, one for the

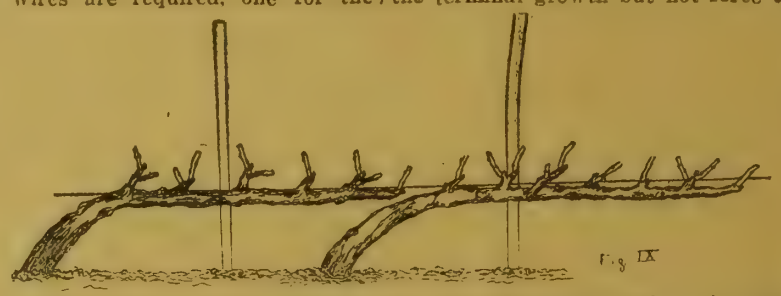

Fig IX

trunk and the other to tie the long canes to. These canes should be bent in the shape of a hoop or bow to force them to send out branches all along the canes or else the object being strived at, more bearing surface, will be defeated.

In our judgment, the three last described methods of pruning are the proper ones for the Coachella district where cuttings start roots and make what are practically two year old vines, the first season. No. 12 galvanized wire is about the proper material for trellising.

Considerable work is required in the spring and summer in starting a young vineyard, in keeping off suckers, water sprouts and topping or pinching back the ends of long shoots. If sprouts are allowed to mature on the trunks or branches of vines, much trouble will follow as a cluster of buds always forms at the base of such a growth. The sprouts may be removed with a close cut at pruning time, but sprouts will continue to start out at such points. The chief loss, however, is in the drain upon the vine by such sprouts during the growing period. Topping of the vines should be done when the tips are about 18 inches from the last bunch of grapes or bloom. One object to be kept in view is to top at the time which will stop the terminal growth but not force out the buds below the fruit or too many laterals beyond the fruit. It is sometimes necessary to top a second time in sections were the growth is very strong or where it is an object to furnish much shade for the fruit.

The cuts used in this article are taken from Bulletin No. 119, issued by the Agricultural Department of the State University.

Vegetables

to bring good prices must have both size andquality.

DO THEY MISS ME AT HOME?

Do they miss me at home—do they miss me?
'Twould be an assurance most dear
To know that this moment some loved one
Were saying: "I wish he were here!"
To feel that the group at the fireside
Were thinking of me as I roam;
Oh, yes, 'twould be joy beyond measure
To know that they miss me at home!

When twilight approaches, the season
That ever is sacred to song,
Does some one repeat my name over,
And sigh that I tarry so long?
And is there a chord in the music
That's missed when my voice is away,
And a chord in each heart that awaketh
Regret at my wearisome stay?

Do they set me a chair near the table,
When evening's home pleasures are nigh,
When the candles are lit in the parlor,
And the stars in the calm azure sky?
And when the "good nights" are repeated
And all lay them down to their sleep,
Do they think of the absent, and waft me
A whispered "good night" while they weep?

Do they miss me at home—do they miss me,
At morning, at noon, or at night?
And lingers one gloomy shade 'round them
That only my presence can light?
Are joys less invitingly welcome
And pleasures less hale than before,
Because one is missed from the circle,
Because I am with them no more?

ARMSTRONG'S CHANCE.

"Joe," said the superintendent of the Montezuma Copper Company, "you're to take the Kitty mare and go down the road until you meet Manuel Gonzalez's outfit. He started from Lordsburg six days ago, so you ought to find him about York's ranch. Just notice particularly where you meet him, and ask him to hurry up. He's got some flour we need."

Joe Armstrong had been looking for this order. Ever since he had been taken into the employ of the company he had been sent on these missions. Invariably three or four days before the end of the month he and the Kitty mare had been sent galloping down the Lordsburg road to meet this freighter or that and tell him to hurry up.

It was 80 miles to Lordsburg, and all the company's freight had to be drawn in ox-teams from the railway at that point.

The humor of asking that an ox-team hurry was not lost on Joe. He knew it took eight or ten days for the plodding cattle to drag the great wagons across the desert and over the hills, and he knew, too, that there was plenty of flour in the warehouse.

But Joe Armstrong also knew enough to hold his tongue and obey orders.

It was not that the mission displeased him; on the contrary, he was delighted—what healthy boy would not welcome the change from the dull routine of the company's store to a ride on Kitty?

It was sunset when he reached York's ranch, where he stopped for supper. There were three other travelers at the ranchman's table. One of them he knew. Mr. Lampson had been a bookkeeper in the company's office and had been discharged for a reason Joe had never learned, and the two strangers were in his company.

"Going to stop over, Joe?" asked Lampson, as they stood at the washing trough.

"Why, no, Mr. Lampson," answered the boy. "I've got a bit of business down the road. It's moonlight, and I guess I'll push on a way. Are you going on?"

Lampson thought not and changed the subject, and the bookkeeper and his two companions were still at York's when Joe saddled up and started on.

Kitty, fresh from her rest and feed of grain, was in as good trim as if she had not already come a score of miles, but Joe would not let her gallop.

Soon she found her stride, the long, swinging lope of the cow ponies that he knew she could hold for 50 miles, if necessary. The brilliant moon almost directly over head cast a shadow like a purple blanket. Except for the hoofbeats there was no sound.

Joe loved to ride at night. He knew every inch of the way, and each tall, branching cactus that stood out in the moonlight was as good as mile posts to him.

Soon he noted a shadow in the brush by the road side keeping pace with him. Half a mile farther a companion shadow on the other side of the road drew his attention.

He knew that they were wildcats, obeying the same instinct that makes their tame congeners follow a man in the city streets in the moonlight. He knew he could send them scurrying away into the brush with a shout, but with the habit of those who live in the wild places of the earth he had no desire to molest anythong that did not molest him. Besides, the leaping shadows were company of a sort, and their presence was a guarantee that no larger savage beast or savage man was near.

Joe lost the companion shadows at the Gila river when he and Kitty splashed across it.

He had not yet found Manuel Gonzalez's train of ox-teams, but he knew they must be comparatively near—probably camped at the spring half a dozen miles farther on. There was nothing to be gained by coming upon them at this time of night. There are certain rules on the frontier, as in the cities, as to breaking a tired man's sleep unnecessarily. So Joe decided to camp near the river and hurry on at day-break with his message.

He unsaddled Kitty and turned her loose to graze in the river bottom, knowing that she would remain close by. Then, finding a place where the brush was thick enough to screen him from sight of the road, he broke through this leafy wall.

A branch used as a broom sufficed to obliterate the tracks that showed a ride had ended there, and behind his screen of mesquite brush he lay down to sleep, his saddle for a pillow, the soft earth for a bed. He needed no covers, for on that high mesa of the Gila there is no dew.

A city boy might wonder that he took pains to hide himself from the road and to disguise the traces of his camp, but to Joe it was as natural as it is to the town-bred lad to lock his bedroom door at a strange hotel.

Joe said his little prayer, taught him by the mother whose death had left him to make his way alone two years before, and closed his eyes. A boy is not likely to forget his prayers when the only roof above him is the sky, and every star seems like a bright eye seeing clear through him. Joe did not have to wait for sleep; he was off as soon as his eyes were shut.

Suddenly he was broad awake again. The moon was gone, but the stars were still shining, and by them he knew day was yet far distant. A moment to collect his wits, and Joe was conscious that somebody was talking on the other side of the bushes. The first words made him all attention.

"Gonzalez's outfit," he heard the voice say, "will come on as soon as it is light, and we had better meet him right here. To strike him tonight might make the bull-driver suspicious, besides, that boy Joe knows I'm not with the company any more. I want to get the money without having to hurt anybody."

"But, say, Lampson," Joe heard another voice, "won't the boy be there just the same in the morning?"

"Not a bit of it," said Lampson, "He'll just give Gonzalez his message and start back. He doesn't know why he is sent. Nobody but the Lordsburg agent and the superintendent is supposed to know there is $25,000 in bills rolled up in a bale of blankets. That much comes every month to pay off the men at the mines on the first. The company is afraid to send it by the stage, for the stage is held up by the rustlers too often. Nobody would ever think of hunting through the freight for the money. The freighter himself hasn't an idea what he is carrying. They have been doing this for a long time and have never had any trouble, but the boss can't help feeling a ilttle anxious, so he always chases the boy off down the road to make sure where the money train is."

Joe's first impulse had been to shout a greeting, but as the words reached him he realized in a flash what they meant. The mystery of his monthly mission that had so puzzled him was a mystery no longer.

"I don't see why we should have a bit of trouble," said Lampson. "I'll just tell Gonzalez that the company is in a hurry for the blankets for some prospecting parties, and has sent me with the buckboard to fetch them on ahead of him. He knows me from seeing me in the office, and will probably not ask a question."

"But," asked one of the others, "suppose the boy has told him you were thrown out?"

"If I can't convince him the boy lied, we will have to make a 'gun-play.' Now quit talking. We'd better all get some sleep."

Soon there was silence, broken only by the regular breathing of the three men.

So cautiously that not even a rustling leaf betrayed him, Joe raised his head and peered through the bushes. He saw three men lying asleep, the buckboard standing at the side of the road, and the horses unhitched and picketed by it.

His first thought was to slip the stake ropes and stampede the horses; but he realized that the sleepers might be awakened by the plunging animals, and the thought of what they might do in their anger made Joe feel lonesome for the first time.

As silently as a fox stalking a wild fowl, Joe skirted the cleared patch and made for the river bottom. He was soon beside the Kitty mare. There was an anxious moment when he was afraid Kitty would greet him with a neigh, but she only raised her head from the tall grass and put out her nose to be petted.

He had ridden her bareback as often as with a saddle, and in a moment he was on her, making his way by a wide detour past the sleeping men. As soon as he was beyond ear-shot he gave Kitty her head and sped away.

His idea had been that all he had to do was to tell Gonzalez of Lampson's plot. Now the words of Lampson himself occurred to him. "Nobody is supposed to know the money is there but the agent at Lordsburg and the superintendent." It was the company's secret, and Joe dared not betray it even to the freighter.

At last a sparkle far ahead showed him the embers of a dying camp-fire, and soon he was near enough to make

out the big white prairie-schooners. He had found Gonzalez's outfit.

The voice of timidity whispered that he might discharge his commission with safety to himself. All he had to do was to deliver his message to the freighter as it was given him, turn around, and gallop back home and say nothing of what he had overheard by the river. The company would lose $25,000, but nobody would blame him.

But another voice—the voice of duty—spoke louder, insisting that taking care of himself was not all he was there for.

"The boss wants you to hurry up; he needs that flour," said Joe to the head freighter, when he had roused him.

Gonzalez grumbled at being wakened for such a message; but he was too sleepy to blame the boy, and finally told him he had better spend the night with them.

"I'll sleep in the wagons if you don't mind," said Joe, to whom a plan had occurred.

"Just as you like," yawned the freighter. "There's a big bale of blankets back in the trailer."

So Joe tethered Kitty to the wheel of the trailer and crawled in on top of the blankets—a rough bale covered with burlap and laced with ropes.

Before dawn he got a cup of coffee from the camp cook, borrowed a saddle, and with a bundle rolled in his coat and tied on behind, started on his long ride home, while Gonzalez and his crew were yet yoking the oxen to the wagons.

Five miles up the road Joe met Lampson and the two big men rolling along in the buckboard. His heart stopped beating until he was past, but the discharged bookkeeper merely waved him a greeting.

Joe galloped on. He felt safe enough now to chuckle at the scene that would be enacted back there, when the robbers, after carrying off the heavy bale, would open it and find nothing.

Kitty was a very tired mare when she brought Joe into town that night.

The superintendent hailed the boy as he rode up to the office of the copper company: "Did you find Gonzalez?"

"Yes, sir!" shouted Joe. "He said he'd hurry." Then Joe pulled his coat from behind the saddle, handed over the bundle of bank notes and blurted out his adventures.

"It wasn't much of a trick to untie the bale, sir," he said, "and I tied it up again while Gonzalez thought I was sleeping; but," he added, I'm afraid the company loses the blankets."

"It's willing to lose them," said the superintendent.

The superintendent talked the matter over with the manager, and at first they thought one of the biggest bank notes in the package was the proper reward for the messenger whose presence of mind had saved the money. But when the superintendent mentioned it to his wife she gave him a better plan, and that is how it came about that for several years the item of a boy's schooling appeared on the expense account of the copper company, with the bills for freight and smelting.

This happened twenty years ago. If you happen to be interested in the story and ever go out to Arizona, the present superintendent of the Montezuma Copper Company can give you the details of the boy's subsequent career.

The present superintendent's name is Armstrong.—Charles Michelson, in Youth's Companion.

RECIPES

Eat Little, but Have That Little Good

SCALLOPED MUSHROOMS.

The small button mushrooms may be used for this dish. Place in an earthen nappy in alternate layers with fine bread crumbs; season with salt and pepper, bits of butter on each layer, and pour over all enough light broth, such as veal or lamb, to moisten well. A little mushroom catsup is an improvement. For a large dish bake for half an hour.

* * *

OYSTER PATTY SHELLS.

Beat one egg light; add two tablespoons of milk, one teaspoon of olive oil, or the same of melted butter, a pinch of salt, and two rounding tablespoons of flour. These had best be tried once or twice before making for a ceremonious occasion, as the butter must be of a perfect consistency. It should be thin, and a timbale iron is a necessity. Fill the shells with creamed oysters.

* * *

ORANGE PUDDING.

Peel and slice four oranges into a deep dish; sprinkle over them a cup of sugar, add juice of one lemon. Beat the yolks of three eggs, one-half cup sugar, two heaping teaspoons of cornstarch and a pinch of salt together; pour over this one pint of boiling milk; let it thicken, then cool before pouring over the oranges. Use whites of eggs for meringue, which brown slowly in the oven.

* * *

DRESSING FOR ROAST DUCK.

Soak enough stale bread to fill the duck in cold water for half an hour, then squeeze dry. Add to it one beaten egg, a tablespoon of melted butter, the same of chopped onion, a teaspoon of sage, and salt and pepper to taste. Mix well and do not fill the duck too full. Use what is left for the pan, and baste as you do the duck. The giblets simmered in a little water, then chopped fine and added to the dressing make a decided improvement.

* * *

PUMPKIN PIE.

To one pint of pumpkin sifted add a scant cup of sugar, one cup of milk, a little salt, one tablespoon molasses, two beaten eggs, half a teaspoon of ginger, a quarter of a teaspoon of allspice, the same of cinnamon and a teaspoon melted butter. Mix thoroughly and bake slowly in one crust. The spices may of course be varied to suit the taste, and if only one egg is at hand, stir in a teaspoon of sifted flour.

"What great misfortune had John Milton?" asked a teacher, looking rather severely over his class. "Please sir, I know!" piped up Johnnie at the end of the row. "Well, Johnnie, you may tell us." "He was a poet!" quoth Johnnie sagaciously.

He is happy whose circumstances suit his temper; but he is more excellent who can suit his temper to any circumstances.—Hume.

IN ANCIENT DAYS.

The sons of Adam were engaged in a warm game of poker. Suddenly Abel discovered he held a wonderful hand. "This is great," he chuckled. "Now I'll raise Cain.'

But before he could do this Adam came in with a switch and raised the dust.—Chicago News.

No man is infallible. Get all the best information you can and use your own cow sense.

Don't fail to consider that if there is one time more important than any other when the "merciful man should be merciful to his beast" it is when they bear their young.

Don't let a new-born calf flounder on a slippery floor or perhaps in the gutter.

Don't swear at your cows or horses; no, nor your hogs. They can't' understand you, and if they could it would not make it any better.

Don't fail to criticise any of the above assertions if you think they are not just right.—A. X. Hyatt, in Farmer's Sentinel.

"Give as you would if an angel
Awaited your gift at the door;
Give as you would if tomorrow
Found you where waiting was o'er;
Give as you would to the Master
If you met his searching look;
Give as you would of your substance
If His hand your offering took."

GOOD THINGS, TOO!

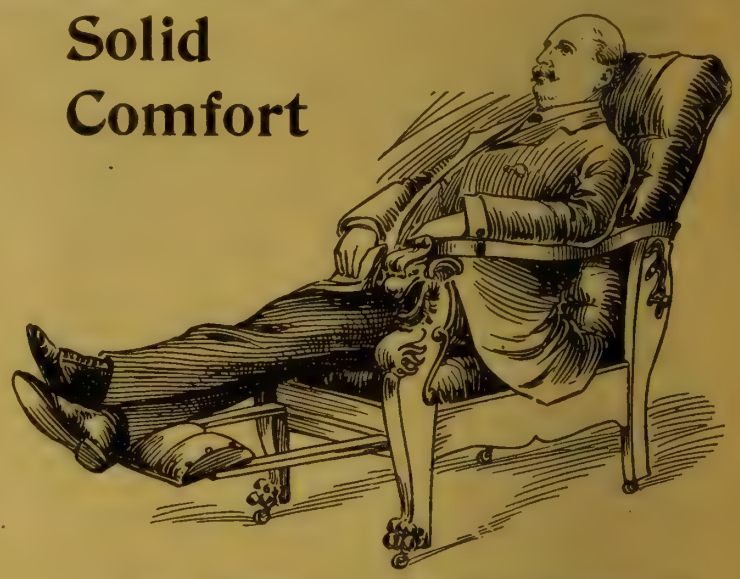
The Christmas Tree—"It is strange that children are so green as to believe in the existence of a Santa Claus."

The Christmas Candle (sputteringly)—"But they are not evergreen."

Dependable Furniture at a Fair Price

Here is the most practical and sensible Morris chair ever made. In addition to complete back adjustment it has adjustable FOOT REST, which shoves in, out of the way, when not in use.

Solid Comfort



The Streit Morris Chair

In all the popular woods, upholstered in leather, pantasole, tapestry, velour and mattings. Prices are right. If not convenient to call, write for booklet

SOUTHERN PACIFIC

CHOICE OF 3 ROUTES

EAST AND WEST

"SUNSET" Via El Paso and New Orleans

"OGDEN" Via San Francisco and Portland

"SHASTA"

The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.

SOUTHERN PACIFIC

261 SOUTH SPRING ST.

Los Angeles Markets.

LOS ANGELES, Dec. 30.

The dry weather is having some tendency to advance the price of hay. There is plenty of medium grade stuff but the better article is growing scarce.

Rolled barley is confidently expected to advance, although cracked corn can be laid down here from Kansas at about $1.17, which fact may prevent a heavy advance in barley.

Green peas and beans are somewhat cheaper, and cabbage is higher, being now quoted at $1.35.

Grapes are in demand at from 12 to 15 cents per pound, and some very fancy stock is on exhibition at the public market.

San Francisco Markets.

Dairy.

San Francisco, Dec. 30, 1903.

A steady but slow market prevailed for really fancy Creamery Butter yesterday, while for the general run of offerings trade was dull and disappointing, with an easy undertone to values.

BUTTER—Per lb.

Creamery, extras	.26	
Creamery, good to fancy	.23	@25
Dairy, extra	.22	@23
Dairy, choice	.19	@21
Store	.18	@19

Eggs and Poultry.

The demand for Eggs lacks bouyancy and as supplies were generally liberal, the market leaned toward easiness.

EGGS—Per doz:

Ranch, selected large	.36	@37
Ranch, good to choice	.34	@35
Store	.30	@32½
California Storage	.28	@32½
Eastern	.25	@30

The Poultry market has been firm the entire week, with prices tending slightly upward.

POULTRY—Old Roosters, per doz., $5.00@5.50; young Roosters, $5@6; Fryers, $4@4.50; Broilers, large, $4@4.50; small, $3@3.50; Hens, small, $4.50@5.50; large, $6@7; Ducks, per doz., old, $5.50@6.50; young, $6.50@7.50; Live Turkeys, per lb., 20@22c; Dressed Turkeys, per lb., 21@24c; Geese, per pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz, old, $1@1.25; Squabs, $2@2.25.

Fruits and Vegetables.

No change of note has attended this branch of the market. Prices remain substantially as quoted last week.

DECIDUOUS FRUITS.—Apples, per box, common to choice, 40@85c; fancy, $1@1.40; Spitzenbergs, $1.40@1.75; Lady Apples, $1@$1.50.

Quinces—Per box, 25@50c.

Table Grapes.—Per box or crate, nominal.

BERRIES—Cranberries, per bbl., Eastern, $12@13.

No particular change marked the citrus market this week, prices as of last week.

CITRUS FRUITS—Per box: Oranges, Navels, fancy, $1.75@2.50; choice, $1.25@1.75; Standard, 85c@$1.25; Seedlings, 75c@$1; Lemons, $1@2; Extra, $2.50; Grape Fruit, $1.75@3; Tangerines, $1@1.50; Japanese Mandarins, $1@1.50; Limes, $4@4.50.

Operators in the potato market only fairly active.

POTATOES—Per ctl.: River Burbanks, 70c@85; Early Rose, nominal; River Reds, 60@75c; Salinas Burbanks, $1.25@1.40; Oregon Burbanks, 90c@$1.10; Sweet Potatoes, $1.60@$1.75.

VEGETABLES—Tomatoes, per box, Bay, nominal; do, southern, per crate, 50@85c; Green Peppers, per lb., 2½@5c; Dried Peppers, Stockton, 5@8c; Wax, 6@10c; String Beans, per lb., 6@10c; Wax, 6@10c; Green Peas, per lb., 5@7c; Egg Plant, per lb., 10@12c; Summer Squash, per box, $1@1.25; Cucumbers hot house, per doz., $2; Mushrooms, per lb., 20@30c; Garlic, per lb., 6@7c; Dry Okra, per lb., 12½c; Marrowfat and Hubbard Squash, jobbing at ½@¾c per lb.

Dried Fruits, Nuts, Etc.

Trading in Fruits has been very unsatisfactory for several days. The market has shown a constant undertone.

DRIED FRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 3½@6c; Sun Dried, 3¼c @4c.

Apricots—Royal, fancy, 9¾@10c; choice, 8½@8¾c; Moorparks, choice, 10@12c.

Peaches—Choice, 5@6c; fancy, 6¼@7c; peeled, in boxes, 11@14c.

Pears—Choice, 7½@8½c; fancy, 9½@10c.

Plums—Pitted, 6@9c; unpitted, 2c.

Prunes—Four sizes, 60s to 100s, 2½@3c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5½c; Red, 4@5½c.

Figs—White, 4@5c; Black, 4@4½c.

NUTS—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Pecans, 11@13c; Pinenuts, nominal; Peanuts, Eastern, 6@6½c; do, California, nominal; Brazil, 11@12c; Filberts, 10@11c California Walnuts, soft shells, No. 1, 13@14c; do, No. 2, 11@12c; hard shells, No. 1, 12@13; do, No. 2, 10@11c; Hickory, 8@10c; Chestnuts, Italian, 9@10c; Cocoanuts, $4.50@$5 per hundred.

HONEY—New comb, per lb., White, 12@14c; Amber, 10@12c.

Beans.

Trading in Beans continues of a holiday character and the market maintains a steady tone under scant offerings.

DRIED PEAS—Prices, per ctl: Green, $2.50; Niles, $2.75.

BEANS—Price per ctl: Large Whites, $2.40@2.65; small do, $2.90@3.10; Pea, $3@3.10; Lima, $3.10@3.15; Red, $3@3.15; Pink, $2.60@2.75; Bayo, $2.25@2.45; Blackeyes, 2@2.15; Red Kidneys, $4.25@4.50.

Live Stock.

CATTLE—No 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 6¼@7c; No. 1 Cows and Heifers, 6½c, second quality, 5½@6c; thin Cows and Heifers, 4@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

Chicago Live Stock.

CHICAGO, Dec. 23.—Cattle—Receipts, 4000, steady; good to prime steers, 4.90@5.75; poor to medium, 3.25@4.80; stockers and feeders, 2.00@4.00; cows, 1.50@3.50; heifers, 2.00@4.75; canners, 1.50@2.20; bulls, 1.75@4.25; calves, 2.00@5.75. Hogs—Receipts, today, 25,000; tomorrow, 35,000; strong; mixed and butchers, 4.35@4.60; good to choice heavy, 4.45@4.55; rough heavy, 4.30@4.45; light, 4.15@4.20; bulk of sales, 4.35@4.50. Sheep—Receipts, 14,000; sheep and lambs steady; good to choice wethers, 3.50@4.00; fair to choice mixed, 2.75@3.50; western sheep, 2.75@4.00; native lambs, 4.00@5.85; western lambs, 3.75@5.40.

California Dried Fruits.

NEW YORK, Dec. 30.—The market for evaporated apples is quiet and unchanged; common, 4@5c; prime, 5⅛@5¼c; choice, 5½@6¼c; fancy, 6½@7c. Prunes continue to attract some export demand, but domestic takings are small and the market steady. Quotations range from 3⅝@6½c, according to grade. Apricots are quiet, choice are quoted at 9¼@9½c; extra choice, 9¾@10¼c; fancy, 11@15c. Peaches are quiet; choice, 7¼@7¾c; extra choice, 7¾@8¼c; fancy, 9¼@10¾c.

CITRUS MARKETS

THE ORANGE MARKET.

Orange Market: The situation in general during the past week has been quite satisfactory. All shipments from Southern California have been taken at fair prices, and the same may be said of everything from Northern California, except such cars as show an unusual amount of greenness, spots, etc. The larger eastern auctions show very satisfactory condition, and quite heavy consumption at the prices prevailing. There is a fair demand in Eastern markets, and orders are coming in quite freely for shipment, showing the business to be starting up promptly, with less of a tendency to sag heavily during the two or three weeks after the holidays, which has sometimes been the case.

THE LEMON MARKET.

Lemon Markets: The lemon market is a thing of the past. There is scarcely any demand and the situation is very unsatisfactory. Stocks of Californias are clearing up somewhat, however, and a little better condition will probably prevail in a short time.

The California Fruit Agency has opened an office in this city, and installed an agent to handle the business that should be done at this point, and expect to fully supply the market with all classes of goods. This will undoubtedly be of much benefit to the people in this city, who have in the past gotten a large proportion of an undesirable class of fruit, and the Agency will see that the market is fully supplied with as much desirable stock as the people will purchase. It is their desire to change the consumption to a much higher class of fruit than has been used heretofore. There has been some talk of selling this fruit through an auction, but the manner of handling will be decided as the needs of the business demand.

Geo E Franklin weather forecaster reports the conditions of weather and crops up to yesterday as follows: Clear, dry weather with cold nights and warm days continue with considerable high desert wind. Oranges and lemons were saved in sections where there was heavy frost on the nights of December 23d and 24th, by the high winds. The desert winds continue to dry out the soil, which can ill afford to lose moisture, otherwise no harm resulted.

Farm work is generally at a standstill, owing to the long continued drought and as a result there will probably be a shortage in the grain crop. Irrigation continues, which is unusual at this time of the year. Mountain streams are holding up well and ditches are said to have plenty of water.

While the drought is assuming a serious aspect, farmers are not yet discouraged believing a reaction will occur and point to previous seasons in corroboration. Owing to the drought but a limited number of reports are being received for the weekly bulletins, as there is not much doing in the way of farm work.

WHAT SHE NEEDED.

"I don't know what to do about my daughter Lucy," said a perplexed mother who had come to an outspoken but kindly old physician for advice. "She seems so listless and does not seem to have any interest in life, and she's so irritable at times. I don't think she has exercise enough, and I want to know what you think about my sending her to a gymnasium or a dancing school. She's tired of her bicycle and the lawn-tennis season is past. What would you advise?"

"How old is she?" asked the doctor.

"Nearly 19."

"Can she cook?"

"Oh, no; she knows nothing about cooking."

"Can she sweep?"

"No; my maid does all the sweeping."

"Does she take care of her room and make her own bed?"

"No; I do that. Her room is next to mine and I've always attended to that."

"Does she have any part whatever in the household duties?"

"No; I cannot say that she has."

"No duties, no obligations, no responsibility, no part in the work to be done in every household."

"Well, no."

"Then, madam," said the doctor frankly, "your daughter has no need of a gymnasium in which to expand her pent-up energies. I don't wonder that she is irritable and unhappy."

"What would you advise?" asked the mother, weakly.

"I would advise you to make her feel that she has a part and a place in your home life; that its duties must be borne by all the members of the family in common, and that she must do her part toward contributing to the general comfort of the home. A girl of her age, with no home duties, no responsibilities, no interest in her home, needs more than a gymnasium or a dancing school to make her helpful and happy."—Houshold.

FOR SALE

I will sell my ranch one mile east of San Bernardino, consisting of 64 acres, mostly damp land, peat or underlaid with peat. This is the finest dairy and alfalfa ranch in San Bernardino county. Will sell with implements and stock if desired. For price and terms, address

J. M. Cardiff, San Bernardino, Cal.

DANDY Bean Picker.

Hand-picked beans bring double price. Make $2 to $3 a day picking them over at home in winter months with the **Dandy Picker.** A special tool for a special purpose—best of kind in the world. Description free.

LUTHER BROS. CO.,
11 Mill St. N. Milwaukee, Wis.

THE FEEDING PROBLEM

STUFFING AND STARVING

SCHOONERS BRINGING FEED TO PETALUMA, WHERE COULSON'S EGG FOOD IS MADE.

When hens do not lay at all or do not lay well, many owners think that if the hens look well, are rosy, plump and fat, it is an indication that the hens surely receive ample supplies of food. But in this they are mistaken, although they may stuff their hens with soft feed, wheat and corn and the hens may be fat and heavy as lead and yet they are actually starving for lack of protein and minerals, etc., that they need more of than they can get.

They are expected to lay eggs when they are not fed the material that makes eggs. When hens are fed on wheat, corn, middlings, etc., food that contains one part protein or muscle-forming food and nine parts of carbohydrates and fat, they will gradually get too fat to lay because all the protein they receive in the food is needed for their body sustainance and there is nothing left for eggs, except excesses of other nutriments which she cannot use for body maintenance, will not alone make eggs and can only be stored as layers of fat where they are less than useless. Instances are common where fowls receive more than sufficient food but it is so badly balanced that they lay few or no eggs.

Feeding is not everything in poultry keeping, but it is one of the most important ways of getting results.

Proper feeding of Coulson's Egg food, besides making hens lay will also help to produce Plumage that will make the fowl indifferent to cold or rain. Coulson's Egg Food is designed to give the laying fowls just what they are kept for—eggs.

This Food contains in adequate quantity eevrything that is necessary to make perfect eggs which will permit of perfect development of chicks while in the egg. Therefore, if you want eggs that will be hatchable and hatch good strong chicks, you should feed Coulson's Egg Food, a complete balanced ration for laying hens.

The egg is the surplus which the hen throws off after all the needs of her system have been supplied, the excess over and above what she needs to repair waste and keep her in perfect health.

Unless a hen is supplied with material for egg production she cannot lay. She can no more produce egg without the proper food than a factory can turn out a finished product without raw material.

FEEDING FOR EGGS

A hen generally consumes from six to eight ounces of feed a day. If she is fed on shorts, or common chop feed, she will have to eat from one to three lbs. before she gets enough material to produce an egg, besides supplying her bodily needs, and as it will take from three to five days for a hen to consume that much food, she will be able to lay only one egg every four days' time.

Now, if this same hen should be fed on a rich egg producing food, like Coulson's Egg Food, she would have to eat only eight ounces to give her enough material to form the egg and supply her bodily needs, besides; so it can readily be seen that if a hen be fed on Coulson's Egg Food two meals a day she will be able to lay an egg nearly every day.

The men who get results in egg production are the men who pay great attention to feeding, and feeding egg producing food—Coulson's Egg Food.

It is a wholesome and safe food, contains nothing injurious. A correctly balanced ration; a scientific poultry food, prepared by people who know how. It is not an experiment. It is successfully used by hundreds of the most successful poultrymen and recommended highly. Fed as a warm mash either morning, noon or evening. Saves bother in mixing; your time is your money. Produces excellent results by natural methods. Price reasonable—cheapest feed on the market, for it gives best results. Goes twice as far as ordinary feed; increases egg production, furnishes bone, muscle, feathers and meat and helps fowls to grow. Pullets begin laying earlier. Shortens moulting period. You can have eggs in winter when eggs are profitable. It is just the feed that all poultrymen are looking for—a feed that makes hens lay nearly every day.

One hundred and seventy-five eggs per year per hen by feeding Coulson's Balanced Egg Food.

Are you feeding your hens this feed? If you are not, you are making a great mistake. Coulsons prepared food for laying hens is just what your hens need and they must have it if you expect them to lay many eggs at this time of year. There is in this egg food everything necessary to help the hen grow the eggs.

D. H. Ward of Cotati, says: "I have fed Coulson's Egg Food for over a year and I am well satisfied with it. I am now getting 90 dozen eggs a week from 500 hens. My hens laid well last winter on this food and I shall continue to feed it this winter."

Others try to economize by feeding a cheaper feed but they make a great mistake.

Price of Coulson's Egg Food at the Factory, we do not pay freight: One sack, $1.65; 5 sacks, $7.75; ½ ton, 11 sacks, $16.50; 1 ton, 22 sacks, $33.00. We place on cars free of charge.

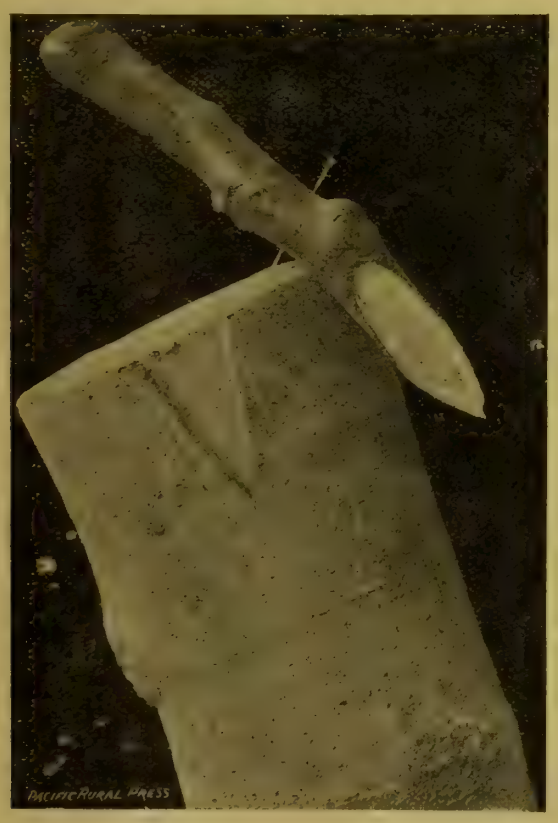
Successful Fig Culture

BY A STAFF CORRESPONDENT

It was the pleasure of the writer recently to visit the home place of Geo. C. Roeding of the Fancher Creek Nurseries and see the fig orchard from which the celebrated Calimyrna figs are produced. This place covers a section of land, beautiful sandy loam



Showing Method of Grafting the fig.

but of this only sixty-five acres are in figs. We say only sixty-five acres for we presume Mr. Roeding would now prefer more of his place in this profitable fruit. But the time was when that acreage was sufficient—more than sufficient.

For sixteen years its owner kept those trees in good condition without a penny in return. For sixteen years the search for something to make those trees bear was continued and successfully accomplished in the securing of the Blastophoga grossorum from Smyrna. The interesting story of that work was given some months ago in this paper. Now there are a number of the Capri fig trees on the place with a crop of winter figs which are carrying the colonies of the insect which will later pollenize the growing figs. Most of the trees stand out in the open, though a few are covered with a frame work thatched with palm leaves. This protection is simply a matter of extra precaution, for the cold season has never yet been severe enough to injure the fruit on other trees which are exposed and had no protection at all. These figs are small, green and not inviting in appearance in the least, but they answer the purpose in the economy of nature and produce the wonderful little insect which carries the pollen from the one to the other flower and has made commercial fig culture in this country the success which now promises much for the future.

How far this culture may extend is unknown, but in most of California and some of the southern states and in Mexico, it will doubtless be planted. Mr. Roeding has made shipments to Australia and many of the islands of the Pacific, but we presume there is no more desirable conditions than prevail in the great San Joaquin and the Sacramento valleys. The heat of summer is sufficient to secure the required amount of sugar in the fruit. The ripening is early so that the drying is out of the way of the fall rains and fogs.

As may be seen by engravings in this paper the grafting of the fig is readily accomplished. Several long rows of Adriatics and other varieties have been grafted to Calimyrna and have grown fine heads and will soon be in full bearing again.

The drying and marketing are simpler and more satisfactory than most other dried fruits. The demand must increase as the fruit becomes better known to the trade. Instead of being packed as is the Smyrna so as to lessen one's appetite for that fruit, it is packed in tasty cartons by girls, the package sealed, this keeping it perfectly clean.

Some fruit was exhibited at the State Fruit Growers Convention, at Fresno, which was some fifteen or sixteen months old, yet it was in fine condition.

Figs are not Mr. Roeding's sole interest, for his large nursery interest in olive and raisin culture all take much of his time.

He has a half million of olive cuttings in his nursery, almost a million deciduous trees, a half million vines and other features, including ornamentals, citrus, etc, which makes a big business,

THIS EMPIRE OF THE WEST HAS GREAT PROMISE.

"Looking into next year we might compare this western empire with a youth just reaching legal age, with all the strength and force of a young man, his life's accomplishments ahead of him. This country has experienced the excitements, pleasures and disappointments of its young life, and has now settled down to the earnest execution of its life-work. While developing her own resources as never before, she is already reaching out to come into closer contact with the great possibilities of the Orient, and in this connection it is safe to say that there are splendid openings in the Pacific Islands for progressive advertisers in many lines of trade.

Every advertiser may set it down as a fact that somewhere in this development work there is a place for him and his products; he has only to keep in close touch with the movement of events and watch for a favorable opening."—W. D. Curtis in Profitable Advertising.

The above hopeful words by Mr. Curtis occur in the Western Edition of Profitable Advertising, which devoted nearly its whole edition to conditions of the West. But the "West" in the eyes of the "East" seems to center around Chicago. In that edition only Mr. Curtis and a very few others got this side the Rockies. There's a wonderful section out here on the rim. May the 'way back easterners learn this and come out here and cultivate us. The Cultivator is a rattling good cultivator, all right.

A Neat Catalogue.—The Armstrong Nurseries of Ontario, have just issued a very neat catalogue of deciduous, citrus and ornamental trees. It has hints to planters and buyers, lists with descriptions of varieties of trees and plants which makes it of value. The book is illustrated with a number of well executed half-tone engravings. The work is done by the Kruckeberg Press, of Los Angeles, and is a credit to that house.

One illustration of the worth of the catalogue is in the list of peaches, we note that each peach is not only fully described but time of ripening given as well. For instance:

. Muir.—Large yellow freestone; of excellent quality; flesh yellow clear through; pits small. One of the most popular varieties for canning and especially adapted for drying. August.

The grafted fig tree

ITEMS OF INTEREST.

The Chicago Tragedy—Awful was the introduction of the New Year to the people of Chicago and surrounding country. The burning of the Iroquis theatre wherein passed away several hundred people, created a tragedy that has been equalled but once in the past century, and that instance was the burning of a London theatre. Scarce a state in the middle west but had some citizen in the Iroquis theatre when the dreadful sacrifice was made. May the lesson learned from this awful calamity serve for all time, in this country, and spur the officials in every city to look well to their duty in enforcing the proper construction of all places where public gatherings are to be held.

* * *

Congress Re-assembles—The one important business of the Congress just re-assembled will be the consideration of the Panama treaty. On this subject the President has gone into detail exhaustively in his message, and his position is regarded, by men of all shades of politics, as eminently sound. One sentence in his message explains the whole subject so tersely as to commend general attention. In this he says:

"In conclusion let me repeat that the question actually before this government is not that of recognition of Panama, as an independent republic; that already is an accomplished fact; the only question is whether or not we shall build an isthmian canal."

Herein is the gist of the whole question and upon the determination of this must Congress he held responsible by the Nation.

* * *

Prosperity For 1904—Statisticians have concluded their study of the financial conditions of the country, for the past year, and are taking a hopeful view of the coming one. In the city of Chicago the clearing of the banks reached the highest mark in the city's history. Deposits also passed the point of all previous years. In the middle west crops have ranked well with those of former years, even surpassing many marked for their abundance. Good prices paid to farmers for them have made a foundation of prosperity that cannot fail to prevent any possible depression.

The railroad earnings of the West on the whole, broke all previous records. The volume of traffic was enormous, and surprised even the most far-sighted managers. The business offered was so immense as to require enormous expenditures of money on lines and equipment, and it is the opinion of the railroad authorities that the roads should now be in position to get the benefits of their outlays.

In view of the records of business of the middle west during the year 1903, business men, railroad presidents and bankers take a generally hopeful view of the outlook. They point out that the crops furnish a solid foundation for prosperity. Railroad men say that the earnings will not fall off greatly. Business men expect a first-rate year. Bankers predict easier money conditions.

* * *

Irrigation in California—Between the 16th and 18th of this month, the representative irrigationists of this state will meet in San Francisco the chiefs of the Forestry Bureau, with a view of discussing the methods to be adopted for extending irrigation projects in this state.

No general subject is more important to California people than the enlargement of its water interests, for upon this depends the future prosperity of the commonwealth. Of special interest is the report of Chief Engineer Lippincott, on the Colorado river and its value to California. In this connection he says:

"The engineering problems relating to this are difficult, and are probably among the most complicated that will be encountered in the arid region. There is no reason for believing, however, that these questions cannot be favorably solved and works constructed that will give satisfactory results. Probably the greatest opportunities in the Southwest for very extensive irrigation development lie along the Colorado river. The volume of the available water supply, the area irrigable lands, fertility of soil and climate, all point to great development. This district would be tributary in trade to the towns of Southern California, and, it is believed, offer probably the greatest latent resources back of the Coast district."

It is to be hoped that California's delegation in Congress will be eternally vigilant in pressing to favorable conclusion every project which looks to the development of the water supply of this state.

* * *

Co-Operation the Remedy—Two decades ago, the Porter Brothers were small fruit dealers in Oakland. They gradually built up a commission business until they largely controlled the citrus and deciduous trade of the Pacific coast, and made for themselves large fortunes. They had but one competitor—the Earl Fruit Company. E. T. Earl, of that company, sold out three years ago, realizing $1,000,000 from the sale. James H. Watson, former president of the Porter Brothers Company, in his testimony given at Chicago, before the Fruit Commission Merchants, explains how these great fortunes were secured. He says he received in the way of rebates on freight, about $1,800,000. This, of course, was in addition to the 7 per cent commission on the gross receipts of the fruit handled, now, receiving 7 per cent commission, and a rebate of from $50 to $100, per car on the fruit shipped, it may easily be seen how these commission men could acquire princely fortunes in a few years. Had the farmers of California been properly organized in a general co-operative association the profits which went to the Porter Brothers would have gone to them. If the farmers will organize and stay organized, they will reap millions in a few years—the money now going into the pockets of the commission men. It is estimated, that something like 35,000 car loads of fruit will, this year, be shipped out of California. If there are to be rebates of $50, or $100 per car on this fruit, let the growers see to it that they receive the benefits of such rebates.

* * *

Bee Keepers—The annual meeting of the Southern California Bee Keepers' Association held in this city this week did not draw a large attendance but it did provoke a most interesting discussion on the conditions which attend the business and the necessity for co-operation in the line of better work in future to make the business pay higher returns. Some interesting papers were read on the marketing of honey and kindred subjects.

The Department of Agriculture of the United States estimates the area sown to winter wheat, in the country, at 32,000,000 acres, and in California at 2,411,965 acres.

BY J. W. JEFFREY, LOS ANGELES

THE MAIN PROPOSITION.

The President said in his last message that it was not the question of the recognition of Panama, but the question is shall an isthmian canal be built. The citrus fruit growers are facing the proposition, not as to whether this or that side issue shall have place, but whether there is to be any market at all for citrus fruits at a profitable figure. The main issue is the sale of 25,000 carloads of oranges and lemons. No one conversant with the history of the past or the conditions of the present time can give an uncertain answer as to these queries. Less than one year ago there seemed nothing but disaster ahead. That the magnitude of the crop, the loose-jointed methods in vogue this end of the line and the lack of unity all along the line was responsible for a large measure of the trouble no one can deny. It is equally patent that the demoralization would have continued indefinitely had not the hitherto adverse elements come to an understanding of the great menace before them in time to partially remedy the evil ere last season closed with a dark record for the citrus industry. It is useless for any one to controvert the proposition that a lack of general organization would have been fatal to all, even the smallest independent going down in the fatal wreck. If these things are true one would cut a sorry figure in opposing the present arrangment for marketing citrus fruits were the results of his action set before the calamity that would inevitably follow general disorganization.

The fruit growers are not alone in the interests involved in a co-operative plan of selling oranges and lemons. Every business on the coast, the welfare of the working men, the maintenance of farm and urban values and even the benefits derived from tourist visitors would immediately feel the results of a failure of a general marketing plan. Were the co-operative efforts of selling fruit suddenly abandoned, a wail of woe would be heard from all industries and interests. The people might not understand the causes of a permanent slump in the orange market but they would feel the results. However, there is little probability of the growers ever lapsing to their former condition of loss and discouragement through any lack of effort or misunderstanding of what they would have to face. "The burnt child will shun the fire." If the growers generally feel the necessity of organization there is no hope of success in attempting to overturn the present plans of the Fruit Agency. There is no mistake as to the feelings of the growers on this point. A few there are, who, from motives of supposed self-interest, from outside influences or from misapprehension of the effects of their action, prefer to antagonize any plan that does not take into account these personal feelings. There is no way to convince these people of their error without a return to a chaotic condition in which all would be ruined. This cannot be thought of, and consequently the co-operators will have to fare along in the face of this puny opposition. Circumstances may soon wear it out, but in the meantime every well-wisher of the grower should stand pat, with the certainty that there is nothing so demoralizing as disorganization or ultimately destructive. It is not a case of flying to the ills we know not of, but one of flying into old condition of helpless dependence.

NOTICE OF MEETING.

A meeting of the members of the Apple Growers' Association, will be held in room A, at the Court House in Los Angeles, on Saturday, January 16th, at 10 a. m.—Fred'k. Maskew, Sec'y.

BY DR. W. J OLIVER,
109 North Broadway, Los Angeles.

FORM OF GARGET.

Editor Cultivator I have a cow that had some obstruction in one of her teats with last calf. I opened it repeatedly, used a plug and milk tube, but with poor success. I bathed it twice a day with hot water, rubbed it thoroughly, but was never able to get only a few drops of milk at each milking. About two months before she dried off I ceased milking that quarter. She freshened again a few days ago. Now the same quarter is badly swollen and hard. I opened the duct again but can not draw anything off. What can I do to relieve her and is there any chance of bringing that quarter back to a normal condition.—Yours W. J. W.

None, whatever, the quarter is lost.

* * *

SIMPLE APTHALMIA.

Editor Cultivator Will you please tell me through the Cultivator, what to do for a horse that has been troubled with his eyes for about a month? He will at times in the morning have one or both eyes closed, as if he had something in it, and water will come out of it. and in four or five hours after I take him out of the barn, he will apparently look as if he would be all right and other times will have his eyes closed all day. The horse is about 8 years old, and is in very good condition, and working every day.—Subscriber.

The trouble appears to be an inflammation of the duct of the eye. Treatment: Sulphate of zinc 10 grains, quinine 3 grains, water 2 ozs., inject with dropper three times a day.

* * *

GRUBS.

Editor Cultivator: Will you tell me through the Cultivator what to do for grubs in stock cattle along the back bone, and do they effect them in any way?—Yours, A Subscriber.

Put a little turpentine over each and press on them. They will come out.

* * *

FORM OF ANTHRAX.

Editor Cultivator: I have lately lost three cows from what was said to be bloody murrain. They were somewhat constipated but not badly. Two of them passed bloody water but the third never did. Their horns were cold and warm by turn, they seemed to be weak in hind quarters, throat was sore, and they had running at nose and mouth. A fresh cow was taken sick two days after calving. She showed same symptoms as others had. with the exception that she had diarrhoea and did not pass bloody water. I gave her a dose of sulphur, saltpetre and turpentine and she improved to a certain extent. About two weeks after calving, thick, dark blood began to flow when she lay down. This has almost stopped now, but her appetite is not good, it seems to hurt her to eat and drink, and she eats dirt. Her nose is clean now and has been for sometime. Please tell me through the Cultivator what to do for her and oblige.—Subscriber.

In the first place, it will be necessary to clean the cow out. Give one and a half pounds of epsom salts, ginger 2 oz., dissolve in three quarts of water and give as drench. Follow up with tonic of nux vomica powder 3 oz., powder gentin 4 oz., mix and give tablespoonful twice a day.

California apples are highly appreciated in Plauen, Germany, so writes the American Consul, Hugo Muench.

Some weeks ago mention was made in the Cultivator of the great discovery of James Dennis, of Richmond. Indiana. At a nominal expense he saturates clay, with a secret chemical and thus creates a fuel as good as the best coal. A company of capitalists has been organized to put the new fuel on the market.

Conducted by Prof. A. J. Cook, Claremont, Cal.

A B C OF INSECTS.

Today we will say the closing word regarding moths and butterflies. We recognize that this order, Lepidoptera, is peculiarly interesting for two reasons. The insects are usually so beautiful that they attract general attention and are regarded as among the natural gems by all lovers of nature. Again, like the locust order, they all feed on vegetation and so are among our notorious insects foes. It is not the butterfly or moth, however, that destroys our valuable product, but the worm-like caterpillar. A very intelligent farmer the other day at the Glendora Institute spoke of the orange caterpillar as the orange maggot. "Why," he said, "it was round and smooth and white and must be a maggot." It was undoubtedly a caterpillar, which may be and often is as smooth as any maggot. We remember that the caterpillar has usually sixteen legs, always ten or more, while the maggot is footless. Again, the caterpillar will always produce a butterfly or moth while a two winged fly comes as surely from the maggot. This, then, is the test.

* * *

The Boring Caterpillars.—There is a small family of moths which are exceedingly wasp like. They have bright colored and often partially transparent wings, fly rapidly in the hot sunshine, and closely mimic moths, which doubtless protects them from insectiverous birds. Their larvae, are smooth, that is, without hair, of whitish color, and all have the habit of feeding upon wood. They are among the most serious borers. They pupate in their own chips. These boring caterpillars are often as damaging as are the boring grubs previously described. Here belongs the pestiferous peach borer, very destructive in parts of California. Others of these clear winged moths bore in squashes, currants, maples, etc. I know of cases in Michigan where peach and currant orchards suffered seriously from these borers, and yet, by concerted action of the fruitmen, were entirely freed of the enemy. It goes without saying that caterpillars may usually be killed by the use of Paris green, but in case of borers, they must be dug out, or in case they bore into twigs, the latter must be pruned off and burned.

* * *

Butterflies.—Everybody recognizes the butterfly, of which there are at least three distinct families. They are diurnal, that is, they fly by day, nearly all, approximate their wing at the back when at rest, and all have knobbed antennae in which they differ from all others of this order. The pupa of these has often metallic hues and hence the name, crysalis, from a word meaning golden, which is applied to the pupa. They pupate unprotected and are suspended by a tuft of silk. The larva always has sixteen legs and may be entirely naked or without hairs or again, may be quite hairy and in some cases spinous. When naked they are usually protected by rank odors. It is easy to see how the hair and spines would serve as protection from bird or other insect. The caterpillars of butterflies are great feeders and except from the fact that they often feed upon weeds or valueless plants, they would be much more serious pests, even, than they are at present. The white, imported cabbage butterfly has reached every state of our country, and is a very serious pest. We have a very dark, almost black, butterfly with a bun border, which is common all over the United States, and which feeds on the willow and elm. The black caterpillars are gregarious and when not feeding are gathered in a cluster, probably for warmth, possibly to protect them from parasites. They are often very destructive to our willows and from their habit of clustering when at rest, they are quickly seen and may be easily destroyed by hand-picking. From what I have said so frequently, all will at once think of Paris green or the arsenites as the sovereign remedy against these caterpillars of butterflies.

* * *

Puffy Fruit.—A few days since, I had the pleasure of visiting some of the orchards about Monrovia. In strolling about in the fine orchard of Professor Williams, president of their club, we came upon a tree that bore the most puffy fruit that I ever saw on a single tree. The majority of the oranges were very much disfigured by the bulging rind. Professor Williams told me that the tree used to bear as fine fruit as any tree in his orchard. Two or three years since, he placed a cesspool near the tree, and now the fruit puffs very badly each year. I suppose that all are agreed that puffiness is the result of unequal growth of peel and pulp. Is it not probable that splitting is caused by the same? We can easily see that if anything should push the peel to excessive growth, puffiness would result while the extra growth of pulp would result in a split. Very likely the close proximity of the cesspool gave a large supply of food as the fruit ripened, and pushed the growth of the peel and hence the disfigured growth. If this view is correct, and surely it has much to sustain it, then any spasm of growth, as the fruit nears maturity, would be likely to manifest itself in split or puff. The obvious cure then would seem to be to work to preserve a steady growth and development by uniform and regular feeding and irrigation. Letting the orchard get too dry and then flooding or the excess or fertilizers would be likely to result in either cracking or puffy fruit.

* * *

Varying Carpels in Citrus Fruit.—We also saw in case of two other, trees, a very interesting marking of the fruit. The separate carpals or section were very distinct both as to color, and line of separation. We know that the fruit of the orange is the ripened ovary. In this case the ovary is compound and is really made up of separate leaves, of course modified. Many think that this marking of the fruit is due to different kinds of pollen in fertilizing the seeds of the separate sections. This is not probable. While we have reason to believe that pollination effects development to retard or increase, we have no reason to think that it modifies the character of the fruit. In this case we have good proof, as the tree bears many marked oranges each year, and surely cross pollination would not be confined to one or two trees to the exclusion of others. It is rather in the nature of a sport or variation. Just as separate leaves may vary in form or color, so the separate carpels of the fruit, which, as we have seen, are only modified leaves, may likewise vary. As stated above, the separate carpels in this case were not only different in color, but a rib or crease separated them. Prof. Williams told me that as the fruit colored up, these lines of demarcation disappeared, so that there was no disfigurement of the ripened fruit.

* * *

Fuller's Rose Beetle.—Inspector Maskew in his excellent talks at the Pasadena and Glendora Institutes this past week, made an assertion which will surprise many. He stated that Fuller's Rose Beetle was by all odds the worst insect pest, at the present time, in Southern California. Those who know how accurate Mr. Maskew is, will believe he has good grounds for this assertion. It is not the beetle that Mr. Maskew fears so much as the grubs. These he finds working havoc from Santa Barbara to Orange counties. Presumably they are in all Southern California. The destructive grubs work on a great variety of plants. So great is the importance of this insect that very soon I shall prepare for the readers of the Cultivator the full life history of the insect, with carefully prepared figures illustrating the insect in all its stages.

Mills & Masters

JAS. MILLS, Mgr. RIVERSIDE, CAL.

RIVERSIDE NURSERIES, Riverside, Cal. Fullerton, Cal., Oct. 24, 1903.

Dear Sirs—It is with no small degree of pride that I point to the orange orchard that I set out in June, 1902, with stock from your nurseries. I am not acquainted with any orchard of similar age that has done so well, and is today so promising. This certainly speaks in no uncertain language of the character of the stock coming from your nurseries. Very respectfully, CHARLES CHAPMAN.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

CANKER-WORMS.

During the past years there has been much complant, especially among apple growers, of the ravages of the canker worm, or as it is generally known the measuring worm, inch worm or looper. There are two forms of this pest, which are destructive in our state, the spring canker worm—Paleacrita vernata, Riley—and the fall canker worm—Alsophila pometaria, Harris. There is also a third form which has also proved destructive to forest trees in some of the eastern states, but which, we believe, has not been reported from this state. The common name of inch worm, measuring worm or looper, is derived from the peculiar method of progress of the insect in its larval state. When full grown the caterpillar is about an inch in length and travels from point to point by stretching out its body to its full length, fixing itself by its forefeet, and then, bringing its hind feet close up, forming a loop. It then fastens itself with its hind feet and moves its fore part ahead its full length, repeating the operation until it reaches its stopping place. It is this peculiar mode of locomotion that has given these insects the common name of measuring worms.

The two species of canker-worms resemble each other so closely that the unscientific observer is apt to confound them, yet there are, to the entomologist, marked differences between them. They agree in their general characteristics, both travel in the same peculiar manner, and in their adult stage the males of both are provided with ample wings, while the female is apterous, or wingless. In the Spring canker worms, however, the insects remain in the pupa state through the winter months and emerge as moths in the spring, while in the other case the greater number of moths pass through the pupa state and emerge as moths in the fall.

The Spring canker worm appears, as stated, in its matured form early in the spring. The females, which are wingless, at once crawl up the trunks of the trees and deposit their eggs in such a place that the young, when hatched, will find abundant food. Having accomplished her duty in this respect, she dies. The eggs are of a pearly luster, of very delicate texture, and are deposited in masses of several hundreds, usually well hidden in the crevices of the bark, and are laid without any regularity. The young caterpillars are of a brown or dark olive color, with shiny black heads. When they attain their growth they are about an inch in length and vary in color. The larvae hatch about the time the leaves expand and attain their full growth in three or four weeks. When fully grown they lower themselves to the ground with a delicate silken thread and working their way beneath the surface of the soil, make an earthen cell, which is lined with a few silken threads, and in this way they pass the pupa state.

Spring Canker-Worm. (Paleacrita Vernata-Riley.
A—male. B—female. C—joint of antenna. D—joint of abdomen. E—ovipositor.

The Fall canker worm very closely resembles the Spring variety, although the trained eye will at once detect marked differences in both form and markings in the caterpillars and mature insect. In this variety the moths usually emerge from the pupa state late in the fall and in our climate may even continue to appear until well along in the Spring. The eggs are not laid, as are those of the preceding species, without any regard to regularity, but are deposited in compact masses, fastened to the twigs on which they are laid with an adhesive substance, and are loosely covered with gray hairs which the female rubs over them from her abdomen. In the Spring canker-worms the caterpillar has a number of fine lines down the back; in the Fall variety these are replaced with a broad brown stripe. The moths are larger than the Spring form and have distinct markings. The caterpillar undergoes but two moults and matures rapidly. They hatch early in the spring, and greedily devour the tender foliage of the trees upon which they are located, the apple being an especial favorite. Here they eat and enjoy life, being well hidden from observation by the small curled leaves and their presence is often unexpected until great damage has been done. Like all the loopers, the caterpillar when at rest, assumes a stiff posture, either flat or parallel with the twigs on which they rest, or at an angle of about forty-five degrees. They will maintain this position for hours at a time, and so closely resemble a small twig of the tree on which they are located that it is a difficult matter to see them. Like the Spring canker worm, when full grown they lower themselves to the ground on a silken thread and go into the pupa state beneath the surface.

Fall Canker-Worm. Alsophila pometaria-Harris
A—male. B—female. C—female antenna D—segment of body of female. E—mature larva.

For remedies the Paris green spray has been recommended. Spray the infested trees with one pound of Paris green to 200 gallons of cold water. To prevent the Paris green from injuring the leaves dissolve six pounds of fresh lime in water and add the latter to the solution. Keep the mixture constantly stirred while spraying.

In his paper before the late Fruit Growers' Convention Mr. Ehrhorn states that this had not been altogether satisfactory. He says:

"The canker worm was again present in numbers in several counties. The ill success with the Paris green spray does not seem to warrant its use. As usual, the reports from the use of this spray were conflicting, some growers reporting a total failure,

Canker Worm

while others claimed entire success. Some report that one pound of Paris green to 25 gallons of water, with 20 pounds of lime, has killed the worms after a few days. I believe the cause of the failure is mostly due to the drenching of the trees instead of using a mist spray. I have examined sprayed orchards and have found but little poison on the leaves, generally along the lower edge of the leaf. It is no use spraying trees a la buggy washing—better save money and time. Good results have been obtained by the mesh wire trap when properly applied to the tree. Here again great care must be taken to see that the trap is correctly adjusted."

Perhaps the trap method of dealing with this pest is the best. In this case the wingless females are prevented from climbing the trees to deposit their eggs in the fall. This can be done by placing a wire netting trap, as shown in figure. First place around the tree a piece of cotton batting, and then a strip of wire netting of No. 16 mesh, six or eight inches wide. Tie at top with cord or wire. See that the netting does not touch the tree at bottom. The insects will collect under it and go up as far as they can, being attracted by the light through the netting and there perish. After the female has ceased crawling or hatching, the traps should be removed and scalded, as eggs deposited on them will hatch and the minute larvae will get through the mesh. The trunks of the trees below the trap should also be scrubbed or coated with a thick whitewash.

DECIDUOUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

SOY BEANS ON THE COLORADO RIVER.

Editor Cultivator.—I wish to know if the soy bean can be planted as late as July and make a crop? I have some land on the Colorado river bottom, that overflows and the water does not recede until July. Will they stand any alkali? How much moisture does it require to start the seed? I have some land that does not overflow, is always moist but shows some alkali on the surface. Should the seed be ground for hog feed? Where can I get the seed?—E. C. Smith, Palo Verde, Colo.

The small early or medium early varieties of soy beans should mature a crop with you if planted in July. There are a large number of varieties of soy beans and the names have become badly mixed. Medium Early Green seems to be a well recognized variety that gives good results. The early short varieties produce the most seed and it may be possible that some of them will produce two crops with you in a season on your land that is always moist. They will stand more alkali than rape will, and that will very often make a good crop where alkali comes up in moderate quantities.

We cannot state with any degree of accuracy, how much moisture soy beans require to sprout, but they will sprout in soil moist enough to start barley or wheat.

The seed should be ground when used as hog feed as they will not eat it whole. It should not be fed alone, but mixed with other grains as it is a very concentrated food. At one of the experiment stations, hog fattening experiments were carried on, using Kaffir corn as a basis, and it was found that a saving of 30 per cent. was made in the amount of grain used, when soy bean meal was mixed with Kaffir corn. When soy bean meal is fed to dairy cows, it makes the butter soft.

We do not recommend soy beans for you to plant, for every new country has to work out the local problems for itself. We do not know that they will do well with you, though we see no reason why they will not. They have never become popular in California, but just why it is, we do not know. They will not take the place of the cereals as, they fill a different office, but they do make an excellent substitute for bran and cotton seed meal.

* * *

NON-BEARING PRUNE TREES.

Editor Cultivator.—I have a prune orchard that is healthy and thrifty, on Myrobolan roots, blossoms full, but drops its fruit when it is about the size of peas, has done so for 4 or 5 years. The trees have not been pruned every year, have been sprayed the last two years and are perfectly clean, with bright bark. The soil is heavy, has doby bottom and is in the center of the valley. The orchard was manured last year with stable manure, and will be this year. Please give best time to apply manure and will irrigation be of benefit? Is it best to irrigate before the pits harden or afterward, or is the ground too wet in winter and would draining with tiles be of good and would it affect the irrigation by drawing off the water?—G. R. B., Santa Rosa.

If your trees are young as we suppose they are from the description you give, we should say that they are too thrifty to think of going to work. Ordinarily, prune trees that are so thrifty and refuse to bear, should not be fertilized with stable manure or irrigated as it only increases their vigor and postpones the bearing period. The safest thing for you to do is to stop fertilizing and irrigating, and allow the trees to settle down to a moderate growth. This might be hastened by giving them slight cultivation which would stop any rampart growth, but it would not be safe unless you were prepared to irrigate early in the summer. Irrigation should be done before the pits harden. Land that is heavy clay with doby sub-soil should be irrigated with caution as it does not take much to water-log such soil and drainage cannot take place very well. Tiling would not injure such land even if it were desirable to irrigate it. Don't prune your trees till they bear some good crops.

As far as we know, there is no special time for applying stable manure to prune trees. If we thought that they would be benefited by it, we would put it on whenever we could get it. No matter when it is applied, it will not reach the roots till after it is rained on. On heavy clay soil, it would not leach through during the winter. Theoretically, sometime after mid-winter, would be best, as the nitrogen would reach the roots just about the time that they become active in the spring growth; practically, it is better to haul it out before the rains leach it out in the corral.

* * *

POTATO SCAB.

Editor Cultivator.—Will carbon bisulphide kill potato scab? If so, what treatment?—Subscriber, Fallbrook.

The best remedy for potato scab is corrosive sublimate, about two (2) ounces to 15 gallons of water. Dissolve first in hot water. Let the seed potatoes soak in the solution for about an hour and a half before cutting them. This is the most approved remedy for potato scab. Bi-sulphide of carbon may do the work, but no formula for its use has come to our notice.

CITRUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

INJURIES TO THE ORANGE CROP.

We have been asked for an opinion on the amount of damage done the orange crop by the desert wind that blew during the first week in December. We are not in a position to know. The men in the central exchange are the ones to put this question to. We know that they have been injured in some parts of the Pomona valley, fully 50 per cent., at some points perhaps 80 per cent., and at other places, practically nothing. Some growers claim that the wind direct, did not do them any damage, but the dryness of the atmosphere, the result of the desert winds, has caused their fruit to run to smaller sizes than it otherwise would.

We have noticed that in some places, the leaves have been nearly all blown off on the east sides of the trees, leaving the fruit exposed. There is some apprehension that this fruit will be frozen. It is our opinion that such fruit should be cut off and thrown on the ground and never shipped. It is scarred to begin with and in places already shows signs of shrinking.

The wind in question was perhaps the most severe ever known during the orange growing period in Southern California. We have had harder winds but not of such long duration. It will no doubt impress upon the minds of growers in the wind belts, that the hedge is one of the necessary adjuncts to orange growing.

* * *

BEST STOCK FOR ORANGES.

Editor Cultivator.—Will you please tell me which is the best stock for oranges? Some tell me that Trifoliata is the best, others say sour and others pomelo. Please give me the latest on this subject.—Subscriber, Ontario.

Trifoliata has been tried in certain places and the report seems favorable to this stock. It is claimed that navel trees budded on this root will grow as large as when grafted on other stocks. Trifoliata has always been used as a dwarfing stock, and while there are some navels growing and bearing on it, we do not know of any old trees that will prove that they will grow as large as any under proper care.

Sour stock is a safe root, the trees do well from the start but are slower coming into bearing than when grafted on pomelo or sweet stock. If we were going to plant on land that is rather heavy, we would use sour stock, but on sandy soil, we would take pomelo. It might be that in a few years we would prefer Trifoliata, but from our present knowledge we would not. Pomelo makes a magnificent root system and is a rapid grower. Sour stock that has many surface feeders, produces large crops of oranges, but trees which have few lateral roots, are very poor bearers.

WHERE THEY GROW FINE ORANGE TREES

Covina and Blanchard's Citrus Nurseries

In passing through the country directly east of Los Angeles, one notices one of the prettiest citrus sections in the great level stretch of land extending from a short distance east of the San Gabriel river and on through Pomona and Ontario. In the center of this beautiful section lies a cove or protected section which we have heard termed Citrus Cove, because of the peculiar adaptability to citrus culture. This little cove is named Covina. We don't know the history of its naming, but it's all right.

The other day H. D. Blanchard of that city took in the Cultivator missionary and said, "Let's drive around and see something." Mr. Blanchard has been in Covina several years and so understands where to drive past the places which show fine care, strong growth and loads of fruit.

The crops of fine looking fruit are truly marvelous.

After driving for some time Mr. Blanchard called attention to some exceptionally thrifty young trees planted a couple of years since, and soon to another lot planted a year ago. These were on ranches which had been receiving intelligent care and had apparently come from a nursery which had given them a good start in life. Such young orchards were pointed out by Mr Blanchard and with apparent pride, until it finally developed that he had a sort of parental interest in these trees, as he had grown, budded and cared for them in his nurseries. The interest created by the general thrift and condition of these trees, caused a desire to further look into the conditions which prevail in the nurseries where they were grown. The cuts given on this page give something of an idea of what we saw, excepting in this, that the upper one shows the block of navels before its second or last "topping."

These trees shown in this cut are on three or four year old roots from five-eights to an inch and a quarter in diameter above the buds. In July they had reached a height above the lath to which they were tied and were at that time topped to force the heading. Then again recently they were all topped to check the growth and harden the wood, and now they show a magnificent block of trees almost as uniform in size and appearance as a bushel of peas.

In addition to the block shown in the cut there are other blocks of Valencias equally as strong growing as the Navels. Of these he has a greater number than of the Navels, and because of the good prices commanded by Valencias this past season, there is but little question that these trees will readily find market at good prices. Already some have been purchased and more are being sought for for early planting this spring. In fact, we saw one small orchard which was planted less than two months ago. This is rather a departure from the usual custom of spring planting, and is done that the roots may become thoroughly established for the early spring growth.

The lower picture shows the manner of delivering the trees, each one being taken with a large ball of earth, so that its removal from the ground gives the least shock possible. This method is, however, not preferred by some, because of the fact that the root system is reduced more than is the case where the dirt is taken from the trees and the longer tap roots and laterals are taken up. Mr. Blanchard allows choice of methods to the purchaser and will use utmost care in either case. Where the balling is not done, the roots are given a mud bath and packed in wet straw so as to be transferred to their new home with as little shock as possible.

The soil in which these trees grow is a sandy loam which has induced a mass of fibrous roots, a very important factor in the thrift of orange trees. Another advantage is the age of the roots; these being three and four years old. This assures strong, vigorous growth of the trees.

The owner's attention has been given exclusively to ths caring for the stock, which from its appearance has been very intelligently done, and doubtless more satisfactorily than it is when depending upon others for the most of the work.

Mr. Blanchard says that the sales during the last season were most satisfactory to every customer whom he had, every one of whom stand ready to speak a good word for the Blanchard stock. These purchasers will be referred to when any customer may wish further information regarding the trees, For instauce, Mr. H. M. Houser of Houser Bros. Co., speaks in highest terms in the following letter, which he voluntarily handed Mr. Blanchard;

Covina, Cal., December 29, '03.

To Whom it May Concern: I wish to say that I have planted trees taken from the Covina Nurseries of H. D. Blanchard and can speak of them only in the highest terms. They are true to name, thrifty, strong growing stock.

H. M. Houser.

But still better, as we noted before, is the drive about and seeing the trees in their growth, which they have given after one and two years planting.

The proof of the nursery is the tree which it grows.

* * *

Covina can be reached by the Southern Pacific. is only about twenty miles from Los Angeles and is well worth a trip to see the orchards, the fruit, the town—it's a pretty little town—and Blanchard's nursery.

The Woodland Democrat says that Yolo county wants more small farms.

Sixty thousand exhibts have been so far collected in the Philippine Islands for the St. Louis Fair.

Fluming in the vicinity of Fresno has ceased for the winter. The output exceeds that of 1902 by 4,000,000 feet.

The last Federal census shows that but nine per cent of native born Californians have removed from the state.

Work is well under headway on the Huntington Flats, Montana, for the construction of an irrigating canal for the reclamation of 30,000 acres.

Recently the Pajaro valley Board of Trade sent to Los Angeles 114 varieties of soil, to be placed on exhibition in rooms of Peck's Tourist Bureau.

The Edison Electric Company contemplates expending $350,000 in erecting electric plants in Southern California.

The continued dry weather is driving down into the Montecito valley, Santa Barbara county, from the mountains, wild animals.

The Farmers' Institute recently held by Professors Fowler, Quayle and Sprague, at Santa Rosa, was well attended, and was of great interest to the farmers.

The great Northern Pacific railroad put in operation a rule on their system which provides for the dismissal of any employe who drinks any alcoholic liquors.

Wilton & Ross, of Riverside, have been awarded a contract to construct 500 feet of tunnel of the Salt River irrigation canal, in Arizona. Their bid was $38.75 a lineal foot.

Another use has been found for crude petroleum. Farmers along the San Joaquin river spread it over the levees, and say it largely prevents the washing away of soil.

The great excellence of Oroville oranges seems to be ackowledged even in Southern California, as Los Angeles dealers have recently ordered good sized shipments for the New Year's trade.

The Government asked for bids for hay to be sent to the Philippines. San Francisco houses bid 92½ cents per one hundred pounds. Seattle's bid was $1.27 to $1.40. Five thousand tons are wanted.

An Englishman has invented what he calls a "Pedrail." It is a machine that walks like an elephant, and will haul huge wagons hitched to it, or as many plows across a field as can be attached.

The suit to test the constitutionality of the Woodward law has been set for January 8th, when the commission houses of San Francisco will fight to prevent the establishment of a free market on the wharf.

The California Promotion Committee, 25 New Montgomery street, San Francisco, request everybody to send them the names and address of eastern friends who may be interested in this state, to whom the committee may send literature.

Supervisor Ormsby, of Yolo county, has been experimenting in oiling roads. He used 120 barrels to the mile. Oil and labor cost $132.50 per mile. He spreads fine gravel on a hard smooth surface, then applies the oil. It soon hardens and makes a fine highway.

The Sonoma county grange has adopted a resolution endorsing the action of the San Francisco Harbor Commissioners in canceling the permits of certain wholesale produce dealers who were charged with having refused to deal with merchants who did not belong to the combine.

Now comes H. W. Merkel, chief forester and constructor of roads in Bronx, part of New York, who says the application of tar to roads is much better than oil. It is a success in France, and will prove to be such here. Mr. Merkel has tested it and is highly gratified with results. The tar is boiled, then it was put on in a very crude fashion by hand from a big watering can. It had penetrated nearly an inch after being on the road only three hours, and in a short time the road was solid and in splendid condition.

The scientific friends of Luther Burbank, in different parts of the world, requested a grant from the Carnegie Institute in his behalf, to aid him in further and fuller investigations. He respectfully and firmly declines the proposed assistance, saying that he now is called upon personally by about 6000 information seekers, and receives 30,000 letters per year. If he should accept this grant, additional thousands would feel that they had license to enter his private grounds, consume his time and so overwhelm him that he would not be able to go on with his experiments.

The new freight rates on the Southern Pacific and Santa Fe will go into effect January 18. Thirty articles going east will be raised and about 100 coming from the east. The so-called postage stamp rate of $1.25 per 100 pounds on oranges and lemons from Southern California to all eastern points is not to be disturbed. The rate on nuts of all kinds will be jumped 10 per cent. About 200 carloads of honey go east from California. The rate on such shipments will be advanced 12 per cent. Eastbound shipments of machinery will be jumped from $1.25 to $1.40 per 100 pounds. A similar raise is to be made on machinery shipments into California.

AGRICULTURE.

Quite a fleet of ships has recently left San Francisco for Central America, to be loaded with coffee.

An unusual large area of wheat and barley are being sown in the Sacramento valley.

The Tokay is the popular grape in Sacramento county, and a large area is now being planted to that variety.

Proprietors of steel works from Pennsylvania have purchased 20 acres at Point Richmond and will invest $6,000,000 in the plant.

There was shipped from the Pajaro valley in 1903, 556 carloads of berries. Watsonville strawberries were in the San Francisco markets holiday week.

On some farms in the Yakima valley, Washington, 600 bushels of sweet potatoes were raised to the acre last fall. The crop is new to the people of that section.

There was sold in St. Louis, Mo., Dec. 1, 3,340,000 bushels of wheat, representing a cash value of $3,000,000. The grain was purchased by a syndicate headed by Corwin F. Spencer.

The Washington farmers are selling hundreds of tons of potatoes at 45 cents per 100 pounds, delivered on cars. The potatoes are going to Kansas City and other eastern cities.

The culture of ginseng is receiving renewed attention in California. A few years ago it brought $4.75 to $9.00 per pound. Recently it sold in New York at $11.50 per pound.

Thomas Taylor, during holiday week, drove into Santa Rosa with a wagon load of luscious watermelons which he said he sold out. At this particular time it was ten degrees below zero in Iowa and Illinois.

In the vicinity of Livermore, in Alameda county, there are seven vineyards that aggregate 2268 acres. There are in the same locality thirteen wineries and seven distilleries of brandy. The average product of the grapes in wine is 450,000 gallons annually.

G. W. Bowser, of Coombsville, Napa county, is accorded the credit of introducing Pencilaria in that county. Soil too poor for corn will produce 90 to 100 tons per acre and cattle prefer it to corn fodder. Three to six cuttings per season can be made.

The largest single grape vine in the world is growing near Carpinteria, Santa Barbara county. It exceeds four feet in circumference and its branches

Coast News and Notes

CONTINUED

spread over half an acre of ground. Some seasons it has yielded eight tons of grapes.

Not until 1886 did California produce a raisin crop worthy of notice. Now the San Joaquin valley produces nearly all the raisins used in the United States. The average gross earnings of raisin vineyards is $80.00 per acre.

The owners of tule lands in Contra Costa county, employed eastern experts to come here and investigate as to the possibility of raising cranberries on their lands. The report was very favorable, and the experiment will be tried. At the present time all the cranberries in California markets come from the East.

The Sacramento Union rejoices that the combine of the San Francisco commission merchants has been broken by the Harbor Commissioners. It says: "The truck farmers, orchardists and table grape growers of the Sacramento valley have for a long time complained that it was impossible for them to get a chance to sell to all comers on the State's wharves in San Francisco but that they were compelled to accept whatever the combine offered."

An unsuccessful attempt was made last week to "corner" the barley market in California. The center of operations was at Stockton. The local dealers held about 16,000 tons. They bought at from $1.10 to $1.16¼ and soon December options went from $1.10 to $1.20½. The shorts then succeeded in depressing the price to $1.12, but it was back to $1.17½ the first of this week. It looked as though the Stockton dealers would clean up from $50,000 to $80,000 on the deal, but at noon yesterday, the time for settlement, the shorts spread a surprise by delivering 12,000 tons spot barley and breaking the combine.

HORTICULTURE.

The prune sales in Santa Clara county are still slight.

Yolo county claims to have a superior soil for figs.

Oregon prunes are selling as low as 1¾ cents per pound.

All along the Sacramento river the orchardists are busy pruning their trees.

Idaho is coming to the front as an apple growing state. So far no trouble has been caused by the codling moth.

Several carloads of prunes were rejected recently by Chicago buyers on account of "irregular counts."

Japanese oranges were last week selling at five cents per dozen in Seattle, owing to an overloaded market.

The prune growers of Oregon propose to donate a carload of prunes for free distribution at the St. Louis Fair, as a means of advertising their fruit.

The prune market still remains very dull. A Santa Clara grower recently said: "I will sell ten tons of the best prunes that ever grew for 2¼ cents basis.

Two million dollars will be expended in irrigation works this spring on the Gunison river, Colorado, near Montrose. It is designed to reclaim 120,000 acres.

The San Francisco Savings Union has purchased 10,000 acres of unproductive lands northeast of Rialto for $1,300,711.81, including valuable water rights. It is good orange land when irrigated.

Chemists of Montevideo, South America, are manufacturing a destroyer of fruit pests which rarely or never fails to accomplish the object for which it is intended. The destroyer is named "Frutolin," and is to be put on the markets of the world.

R. C. Allen, of the San Diego Chamber of Commerce, predicts that lemon culture will, in time, be the chief horticultural industry in that part of Southern California. He further states that it will not be many years before the whole United States will receive their supply from California.

LIVE STOCK.

Three thousand cattle are now being fed at Chino on beet pulp and hay, and are doing well on the feed.

Petaluma has for the past two weeks been shipping to San Francisco an average of 6080 dozens of eggs daily for cold storage.

California is making rapid strides in the dairying industry. The value of the business during 1903 is estimated at over $18,000,000.

Ed. Featherstone, a hunter, says there are many wild elk in the hills in the western part of Kern county. Last week he ran on to a herd of 18.

Wild game is plentiful near Cloverdale. A week ago George Cox killed, in the foothills, three cinnamon bears, and G. C. Mather killed a large panther, weighing about 100 pounds.

Dr. A. R. Ward, of the State University, thinks that infection is possible from the eggs from hens having tuberculosis, but has not so fully decided. He is still investigating.

On January 1st there was a great jack rabbit hunt near Echo, Oregon, participated in by 300 men and boys. 10,000 of the animals were killed. Three miles of wire netting caught the rabbits.

Clarence Thornton, who lives near Tulare, a mere youth, is getting a good start in the live stock business. He recently purchased from A. J. Lefever, of Visalia, a Poland China sow weighing 650 pounds, for which he paid $65.00.

At a late meeting of the Sonoma County Co-operative Poultry Association a report was made to the effect that the San Francisco retailers agree to cut loose from the commission men as soon as the association is in position to supply them with eggs direct. Steps will soon be taken by the association to establish in San Francisco a store house to handle the eggs.

Governor Pardee has established a cattle quarantine line extending along the north boundary of San Luis Obispo county, and thence northerly and easterly along the boundaries of Kern and Fresno counties to prevent the spread of the Texas cattle fever into Central and Northern California.

The Santa Barbara County Stock Raisers' Association meet frequently and are putting forth vigorous efforts to stamp out the Texas fever tick in that locality. They assess themselves an annual tax of $250 and an additional tax of two cents per head of cattle owned by any member. The executive committee is E. Sheffield, chairman; F. Bishop, Charles Black, Eduardo Cuesta, James Sloan and A. H. McKay.

One of the favorite drinking fountains now in the market is the Novelty Fountain, manufactured by Mr. Church, with the Germain Seed Co., Los Angeles, and for sale at the store of that firm. It provides perfectly clean water all the day, has an air chamber over the top which aids in keeping the water cool. One of its most important features is the bail, by which it may be suspended, thus keeping it out of the dirt.

* * *

Theodore Payne, the nurseryman and seedsman, at 440 So. Broadway, Los Angeles, is refitting and rebuilding the front of his place. He will have a fine plate glass front and store room for a large stock of seeds and potted plants.

POULTRY FOR PROFIT

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

Last week we had a talk on the fertility of eggs. It is a subject of such importance to poultry raisers that I must add a few words in this issue. We decided that vigor, exercise and proper food is necessary for fertility. I want to emphasize that green food is more necessary for fertility than even animal food. If you cannot give the fowls a properly balanced ration, then give them all the green food they can possibly eat. It is absolutely essential for the fertility of the eggs. But how can we get green food at this time of year? If I cannot get green alfalfa or clover, I go to the feed store and buy a bale of alfalfa, one of the bales that is full of leaves, or the last bale baled, with the leaves swept up in it. A very little experience will enable one to choose the leafy bales. I run that through the clover cutter, fill a bucket with it, pour scalding water over it, put a weight on top, feed part of this in the feed trough at noon, and the rest I mix with the mash at four o'clock, using the alfalfa tea, which is as good as beef tea, to mix with the mash. I also use alfalfa hay in the scratching pens instead of wheat straw, and I frequently give the breeding pens a good fat pumpkin cut in two, a large beet or a cabbage hung up. These keep them in green food and also vary the monotony of the poultry yard by keeping the fowls busy. Busy fowls will not pull feathers or eat their eggs. Busy fowls will lay more eggs and the eggs will be more fertile. Idleness is as bad for fowls as it is for human beings.

Two years ago a good old German worked for me for a short time. He believed in feeding fowls all they would eat, and would get up before I could be there and fill the troughs with wheat. In vain I remonstrated, and told him the wheat must be thrown into the straw. He declared they would never find it in the deep straw and they would starve. About two days later one of my very old hens, a great pet, was found dead of apoplexy, under the perch. He was greatly distressed; wanted to know what was the cause of its death. I said we must cut her open and see. He quickly opened his pocket-knife and we performed a post-mortem examination, and found the hen abnormally fat. This was an object lesson for him, as I explained, "You will feed them too much wheat in the trough, and will not put it in the straw, so they get too fat and die." After that their fare was reduced to one small handful (about an ounce and a half) per hen, and the hens had to work for it.

* * *

Trap Nests.—Last year at this season I wrote a long article on trap nests, giving plans for making one of the cheapest, best and most easily constructed that I have tried. If there are any readers of the Cultivator who would like those plans, I will gladly give them in another paper.

While a great many readers of the Cultivator may not be able always to use trap nests, as traps, all of the time, they can get a great deal of benefit from their occasioanl use as traps, using them as open nests the rest of the time. There is no way to learn which are the good layers in the flock so easily and with so little expenditure of time, as can be done with the nest that shows the hen that laid the egg. It would hardly be possible to describe the great progress that has been made in developing the egg-producing qualities of fowls by careful, skillful, painstaking observation and by the use of the trap nest.

The records from trap nests are some of the most interesting and instructive reading that I have, and it seems to me that it would be impossible to build up an egg flock without trap nests. With the enormous cost of feed, no one can make a success of the poultry business by keeping hens that do not lay, or that lay semi-occasionally.

The best way to identify the different hens is to band them with numbered leg bands, that will not lose off. Then trap her when she lays, mark the number of her brand on the egg and record it in a little book. In small flocks, especially of mixed breeds, the eggs of each hen may differ so much in appearance from the eggs laid by the others, that it may be possible to know them apart, but with large flocks, and especially of line-bred stock, many of the eggs from different hens resemble each other so closely, that it is practically impossible to identify them. The size, shape, and grade of color changes also, with many hens' eggs as laying progresses, so that the only infallible test is the trap nest.

It may appear to many to be a great task to keep track of every individual hen, and it is, more or less, but it pays, for it enables one to build up an egg-laying strain. Keep the eggs from the best layers, hatch them; next year keep the eggs from the best layers again, and so on each year. Cull out those that do not lay well, fatten them and sell them, and in a few years your egg yield will simply astonish you. This can be done by the use of the trap nets.

One of my correspondents asks, "Can you tell by the shape of the egg, or by the little wrinkle on the small end, which eggs will hatch out pullets?" The ancient Romans thought that long eggs contained male chicks and round eggs female chicks, but it has been proven in our day and generation that this is a fallacy. I think I have, however, discovered that the first eggs laid by a hen after resting, that is, after moulting, or incubating, are usually eggs that will hatch out females. I know that my White Rocks laid eggs that hatched pullets in the fall, whilst the cockrels predominated in the late spring. Also I noticed that the eggs first laid after a rest were darker in color. Gradually they became much lighter and then they contained cockrels. This was simply one of the interesting traits that I observed in my chickens; it might not prove the same with other breeds, although a friend of mine noticed the same in White Wyandottes.

Petaluma, California is the Home of the

MR.
One of our salesmen, on his
Photograph

There are many poultrymen who keep all the way from 4000 to even 6000 and 7000 laying hens and who hatch from 12000 to 20000 chickens in a season.

Petaluma is where Coulson's Balanced Ration Egg Food is prepared. About one hundred tons a month of this Egg Food are sold to the poultrymen living near Petaluma. Some of these poultrymen gather 1000 to 1500 eggs every night and sometimes more.

At one place it was proven by careful estimation that in one square mile there are more than 35,000 mature hens and within a radius of ten miles of Petaluma there are about 900,000 hens and in some seasons of the year there are from 2,000,000 to 3,000,000 little chicks besides. For instance, Freeman Bros. have about 12,000 hens; T. E. Thoergesen, 7000 hens; Byron Purvine, 6000, and there are many more who keep an average of about 5000 hens. One thousand hens is considered a small flock.

Now, every man or woman who raises poultry knows that of the many things requiring constant attention, nothing is more important than the feeding question. Fowls must not only have plenty of feed, but it must be of the right kind or they will not thrive and prosper; and unless they do there is failure in store for the poultry raiser. But there is a science in feeding. Laying hens should be fed food that makes egg production and at the same time strengthens the hen. Profits from poultry depend how and what you feed.

The Balanced Ration Egg Food, prepared by the A. R. Coulson Company of Petaluma, is what the Petaluma poultrymen use to make their hens lay. Not only Petaluma poultrymen, but poultry raisers all over the State of California are beginning to find that it is more profitable to feed Coulson's Balanced Ration Egg Food than any other kind of feed. A. R. Coulson, the Chicken Doctor of Petaluma, has made a special study of the feeding problem and he has got it down to a science, and so successful has been the use of this food that $25,000 was invested by the company to manufacture this feed and sell it as cheap as possible. All the ingredients are purchased in carload and even shipload lots, as steamers and schooners come daily to Petaluma loaded with grain and feed. By purchasing everything in immense quantities they are able to use the best of everything needed in the feed and still be able to sell it to the poultrymen at reasonable prices. The granulated or fine ground dried beef blood is prepared by Armour & Co. at the largest packing houses in the world, at Kansas City, and shipped to the A. R. Coulson Co. in 25 and 30 ton lots (the value of a big carload of this articles is nearly $2,000.) Fine ground beef meal and beef scraps are also shipped from the packing houses at Omaha and Chicago. There are about twenty different articles used in preparing Coulson's Egg Food and they are all purchased in large quantities and mixed in a large electric mixing machine (the only one like it on the Pacific coast), and from 250 to 300 sacks a day are turned out at this factory. That the confidence of their earliest customers was not misplaced is shown by the rapid growth of their business. Today they have the best equipped establishment of its kind on the Pacific coast, occupying over 5000 square feet of floor space in California's famous poultry city, Petaluma.

The company has a factory and store at 772-774 Main Streets and a factory at First and E Streets. Here they manufacture medicines, etc., but their principal output consists of poultry medicines and balanced rations for poultry and stock. They send out

TALUMA, WHERE COULSON'S
MADE.

FRANCISCO, DEC. 1-5, 1903.

from ten to twenty carloads of poultry foods a month. A good deal of the Egg Food is used in Sonoma county, but they are rapidly covering the Pacific Coast, there being more than 150 stores handling this feed in California. Many of the poultrymen near Petaluma use 40 or 50 sacks a month of prepared food for laying hens, hauling it out to their ranches in four-horse wagonloads. The wholesal feed dealers purchase as much as 500 sacks at a time.

BUYS A CARLOAD OF COULSON'S POULTRY FOODS.

A. De Rezendes, who has a 400-acre dairy and poultry farm four miles from Tomalis (Marin county, Cal.) this week gets another carload of Coulson's Egg Food and Chick Food—10 tons, 220 sacks, of the Egg Food for the laying hens, and 5 tons, 110 sacks, of the Little Chick Food. From his 850 laying hens he is now getting over 40 dozen eggs a day. Besides the laying hens, Mr. Rezendes has about 1500 pullets, about 5 months old, that will start laying in a short while. And he is hatching out chicks at the rate of 1500 per month. He has already raised nearly 4000 chicks this season, which are now big enough to go to roost. All these chicks and growing pullets were raised on Coulson's Chick Food.

Besides the Egg Food for Hens, they also prepare the Coulson's Chick Food, which is composed of the best selected grains, seeds and meals, 18 different kinds, each in a certain proportion to make a complete balanced ration for infant and growing chicks, turkeys, etc. It is recommended very highly by poultrymen all over the State. Mr. C. H. Purvine, near Petaluma, contracts for this little chick feed in 100 sack lots. Mr. Purvine hatches out a brood of 3000 chicks every six weeks and he feeds the little ones a whole sack a day of Coulson's Chick Food. Mr. Purvine is an old poultry raiser, having been raising poultry for about 15 years, and he has better luck on Coulson's Chick Food than any other kind of feeds. Mr. Garozzi, near Tomales, raises many thousands of chicks, and uses many tons of the Coulson's Chick Food. Coulson's Chick Food promotes the rapid growth of the chick and fully nourishes them, making a bird with a large frame and plenty of meat, and the chicks seem to thrive on it wonderfully and the death losses are reduced to a minimum.

The A. R. Coulson company also manufactures various poultry remedies, such as Roup Cure, Lice Killer, Cholera Cure, Condition Powder, etc. It was Coulson's Cholera Cure and No. 3 Condition Powder that cured the chicken cholera at Fallon creamery last fall when so many thousands of hens died with the disease before these remedies were used.

The company also runs several wagons on the road. The wagons go all over the State of California, visiting the homes of the poultrymen and soliciting orders. On some of their trips they are gone nearly a year before getting back again.

FREE

This company gives out to any poultrymen, a combined 36-page poultry account book, egg record and catalog and any one interested in the poultry business should send for one, as they are free. Address

WATER FOWL.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value. Charcoal sweetens, it effectually improves, it absorbes the injurious gasses which collect in the stomach and bowels, and further acts as a natural and eminently safe cathartic. When applied to the mash fed to ducks, it puts them in good condition for the breeding pen or show room. It tones up their system and brightens up their plumage to perfection. Up to three years ago my ducks used to lay around, being both lazy and sluggish. I knew from experience, things were not just as they ought to be. So I wrote a letter to an Eastern duck raiser. The reply was "do you feed charcoal?" No, I did not, but I commenced to feed it three times a week, and have kept it up ever since. The result is, my ducks are always on the alert, and pleased to say, always in a healthy condition. A great many people are prejudiced against the duck. They are under the impression that they are very dirty creatures and will eat their heads off. I have always contended that they can be kept just as clean as chickens, and a visit to my farm will convince the most skeptical. Then again they say "no money in ducks," well, there's one thing I know, that the duck raisers in San Francisco are getting $6.50 per dozen for eight-week old ducklings. Two weeks ago I sold several dozen ducklings, any color, four weeks old at $5.00 per dozen to a San Francisco firm. Don't you think there is money in this class of poultry? Can you get $5.00 per dozen for four weeks old chicks for commercial purposes? You will honestly say no. I suppose you know that chickens are heir to a score of different diseases, while ducks are heir to only three, and two of these diseases are the fault of the duck raiser. And again, Mr. and Mrs. Chicken are troubled with several kinds of lice, which you find a hard proposition to master, while the duck can boast of being proof against this parasite. I have often wondered why the farmer and orchardist does not keep a few ducks on their places, and why the chicken men do not keep a variety in conjunction with chickens. Don't you know that they will pay for the food they eat and the chickens as well? An exhibitor at the San Francisco show told me that he bought a few Pekins for his boys, they raised three or four hundred ducks from them, that the ducks paid for themselves and the running expenses for the house for one year. Is there money in ducks?

THE BUSINESS END OF POULTRY

Vincent M. Couch, writing in Vick's Family Magazine, says:

To know whether you have made a profit on your hens or not is not easily told unless accounts are kept. Charge the hens up with all the food given them, and also interest on capital invested. Then give them credit for all sales and what eggs and poultry is used in the family; the difference represents the profit, unless you charge for your labor, the value of that depending on how much it was worth at the time.

For stock, which will you begin with? If you buy four or five hens this fall, you will be able to get all the eggs next spring required to give you a good start. You may be able to buy some pure good old birds for a little money, and breeding stock can be bought cheap any time at this season for there are lots of them and breeders want to reduce the number for winter. If you wait until spring and buy breeding stock you must expect to pay more money, as then they have been wintered and are matured, so the owner can tell better what they are and about their value. Then if you wait until spring and buy eggs to start with, that means to wait a whole year before you can raise more than what you get from these eggs, and unless you get a hundred or more eggs the number of chicks is not likely to be large.

If you want to make the winter season most profitable in keeping hens, do not feed the non producers. It is not fair to put the flock down as a loss when some of the hens have laid well and helped to support a lot of drones. The use of trap nests is the only definite way to get at this matter. For the best results it may be even necessary to dispose of some of the pullets; they may appear ever so promising, but as egg producers be a complete failure. Just the same as a growing heifer promises to be a good dairy cow, and when she reaches maturity her qualities as a milk giver are wanting. Some hens that should have been killed before they moulted will feather out and look nice and healthy and perhaps lay a few eggs and quit. Find out which ones these are and dispose of them. It is the only way to do to have a clean cut and profitable flock. Then, after you are pretty well satisfied that only the egg producers remain, go to work and make them comfortable and take care of them. Do not have the flocks too large. Ten square feet is the rule for each hen, but I know that just as good results can be had with a flock of 10 to 15 hens, allowing six square feet, as more. But if you must keep 40 or 50, then more space must be given per hen. Large flocks are not so apt to be properly fed as small ones, and as a rule I prefer the small flock every time.

Did you know that onions were a great tonic for fowls? For fowls as well as quite small chickens they are most excellent as a bowel regulator. At this season of the year, when the hens are run down by heat and strain of moulting, the onion will be found very beneficial. If your hens show signs of dysentery at any season of the year, cut up some onions quite fine and give them to the flock two or three times a week. Boil them and mix through the mash and feed at any time. Quite a lot of onions may be raised on a little plot of ground, and a half-bushel will go quite a long way toward stimulating and bracing up the flock. It is claimed that when fed raw they impart their taste to the flesh and eggs of the fowl, but when fed moderately I believe no such results will follow. I believe that the cheapest green food that can be had for winter use is the white or red clovers or alfalfa, well cured but not over ripe, fed either dry or steamed, but better given in a mash cooked. Waste vegetables of all kinds should not be overlooked; they help wonderfully in winter time to give the ration a variety.

The Black Minorcas are rapidly coming into popularity, because of their persistency in laying and the size and volume of their eggs. When two years old they are at their best, and as a table fowl cannot be excelled.

Those who have tried them, after trying other breeds, are positive that they are at least the equal in all respects of any bird raised in the country.

100 S. C. White Leghorn Pullets, the pick from 300 beauties mated to two-year-old roosters that cannot be beat. Eggs $1.50 per 15; $5.00 per hundred. M. L. CURTIS, Los Soso Poultry Farm, San Luis Obispo, Cal.

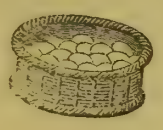
MIDLAND POULTRY FEED

Will make your fowls moult in one-half the time, which means they will lay that much sooner. "Laying fowls are paying fowls." You will not be disappointed at the results you get from feeding Midland Feed.



No. 4, Egg and Feather Producing Food

Is what you should feed your hens now, and the results you get will surprise you, for we know it will prove a paying investment. Our book, "The Science of Poultry Feeding," will tell you more about this feed. Send for it. It is FREE. Also

No. 1, Nursery Chick Food
No. 2, Growing Chick Food

We will be pleased to give you further information about this feed if you wish it. WRITE FOR PRICES.

The Only Reliable Balanced Ration for Poultry in the World.

These special foods are composed of the very best materials obtainable and as carefully and accurately mixed as it is possible to make them. They are a COMPLETE FOOD and will produce specific results, each for its purpose, and no other. We want you to become an established customer of ours. We want your trade, be it little or much. There is only one way we can secure it and that is by sending you material that will do what we claim for it.

The Midland Feed will cost you very little more than any good grain you now feed, and no more than you now expend for all the extras you must use in addition to your grain, and the results will be so far in excess of any previous experience you have had that you will readily acknowledge its value. What the poultry man must be able to count on to a certainty is RESULTS.

C. H. SESSIONS, ASSOCIATE EDITOR

DAIRYING VS. GRAIN RAISING.

"Get a Few Good Cows; There is Room for Us All.

That a lack of sufficient rainfall in June, 1903, seriously cut down the grain yield in many parts of the Dakotas, says M. S. French, is only too plainly evident; but that it is really any detriment to the ultimate prosperiey or future wealth of the twin states may well be doubted.

The dry seasons of the 80's forced us to dairying and stock raising, and although it seemed at the time a mighty bad medicine to take, the most of us old-timers now realize that it was just what was needed then, and it may be so with the present drought. The big grain crops of last year gave proof that money might be made in wheat and flax sometimes, and many who were thinking of stock raising put it aside to give grain raising another trial; but now they are about ready to milk cows with the rest of us.

During the dry spell, one could look at a group of farmers on a street corner and easily pick out, by his long face and general look of weariness and sorrow, the farmer who was in small grain alone. The difference between this man's outlook and that of the man who kept a few cows was plainly shown by their conversation, which might be something like this:

Grain raiser: Getting awful dry. Wheat won't be worth cutting if we don't get rain soon.

Teat puller: Yes, pretty dry. But good weather for corn and millet.

The first, with a sad thought of debts that only his grain crop could pay; and the second, with a satisfactory smile that is cream checks were more than paying all his incidental expenses.

A general merchant whose trade is solely with farmers recently said to me: "See here, let me show you the difference between the present time and ten or fifteen years ago." And, going to his safe, he pulled out several hundred dollars in cream checks, all for June, and all in favor of his store patrons. None were very large, but they all counted up. "And now," said he, "I don't carry one man till after harvest, where I used to carry twenty or thirty." And this was not a creamery town, either, but simply a railroad shipping station.

It is a grand thing for Dakota that she is learning this lesson early, while yet there is plenty of new and fertile land left. In many of our older states it was not until continuous cropping to grain had exhausted and nearly ruined the soil that the cow was allowed to come in and partially replace the fertility that had been wasted in the long years of grain raising.

"But," says some doubter, "if we go to milking, butter won't be worth anything." Never you fear; that song has been sung for more than two score years, and yet butter costs more in comparison to the loaf than ever before. The census figures show that the consumers are increasing far faster than the producers; so again I say to my grain raising friends: "Get a few good cows; there is room for us all.

LIVE STOCK EXPORTS.

The live stock exports during the past three months have been exceptionally good, says a correspondent of the Thrasherman, when compared with the same period in the past two years, the aggregate declared value of the exports for the past nine months having been £690,217, or 24.32 per cent more than during the same period last year. The declared value of the horses exported was £23,078, 22.14 per cent more than in the same period last year; cattle, £112,380, 54.84 per cent more than in the same period last year; sheep, £36,559, or 68 per cent in excess of the corresponding period last year; and swine, £5479, or 49.83 per cent more than in the same period of comparison. The imported horses numbered 17.27 per cent less than in the first nine months of the previous year, and the number was the lowest imported during this period of the year for the past nine years. Of cattle we imported during the past nine months, 383,595 head, or 23.57 per cent more than in the same period of 1902; while the imports of beef during the completed period of the current year amounted to 3,567,435 cwt., an increase of 4.09 per cent over the same period of 1902. Taking the aggregate declared value of the live cattle and beef together, we find that the total for the past nine months amounts to £14,376,699, or 7.54 per cent in excess of that for the same period of 1902 The live sheep imported during the past nine months numbered 236,569, an increase of 11.02 per cent as compared with the same period of 1902, and with the exception of the corresponding total for the same period last year, the lowest total imported during this period of the year since previous to 1895. The aggregate quantity of mutton imported during the same period was 3,230,732 cwt., an increase over the period in 1902 of 4.86 per cent, and the largest quantity ever imported into this country in any nine months of the year.

SHOEING AND CARE OF HORSES' FEET.

It may be safely said that more trouble is experienced with the horses' foot than any other part of the animal, and taking into consideration the hardships, carelessness and crude treatment it is subjected to, this is not to be wondered at. As a matter of truth, it consists of hundreds of distinct parts, all interdependent, but each as absolutely necessary as are the different pieces of a watch. The interspaces between the three bones forming its internal framework or skeleton, contain nerves and blood

vessels and various intricate organs to secrete horn and a greasy, watery substance to lubricate, as it were, each section of the whole, and keep the horn of the hoof soft and elastic; all of which are, to a certain extent, dependent for their safety and sufficiency of agitation on the frog, serious effects of concussion to the body when a horse is traveling on a hard road being not only prevented by this, but the concussion upon it itself causing every one of the parts in the foot to perform properly their functions. In other words, it serves as a spring which saves the horse from being pounded and made sore all over. The right care of it is, therefore, a matter of the most vital importance, and though some smiths, because of their desire to have the foot look well, are altogether too free in using the paring knife, the only admissible paring of the frog is to trim off from it the partially dissevered shreds attached to it, provided, of course, there are any. As to paring the hoof, it should be done in such a manner that the foot will be hollow and the shoe rest on the horny portion of it. Ordinarily, the heel should not be lowered too much, and, with some of the toe cut off as it grows long. A colt's foot, when it is first shod, is round, and if, generally speaking, it were only kept so, fewer, indeed, would be the narrow, contracted feet seen on horses. Round and broad is the way nature intended to have them, but, alas! just because the smith shapes the shoe narrow and puts it on the hoof, whose sides he cuts off, a narrow, contracted foot cannot help but be the result; which feature becomes more manifest every time that the horse is thus shod. Happily, however, a foot made narrow and disfigured by improper shoeing, can in a short time be brought back to its natural form if the shoe is rounded and the opposite course pursued to that by which the foot was mis-shaped. Another abominable thing is rasping the wall of the hoof to make it conform to a badly fitted shoe; a shoe too small for the foot should never be nailed on and the hoof then rasped down to meet it. Neither should the shoe be fitted by heating it red hot and then burning the hoof with it until the sole is level; this not only dries out the horn and makes it liable to split readily, but counteracts its natural growth which is essential to keep the foot in a healthy condition. The shoe should, nevertheless, set straight on the foot, being ranged in line with the frog and the toe of the shoe. By looking at the foot, it is not difficult to see whether one side has grown out more than the other side, needless to say, they should be set over so that the foot becomes straight. If the shoe, for example, is nearly half an inch higher on the outside, the constant extra pounding that the inner heel of the foot will receive is quite sure to make it intensely tender and painful, and may lame the horse; thereupon it will be necessary, perhaps, to poultice for a day or two, and afterwards put on a bar-shoe, to render the animal perfect again. From the same kind of shoeing corns are also produced in the foot, which often make the sufferer very lame, and if not speedily remedied may lead to bad cases of quittor, requiring even the skill of a veterinarian ere a cure is effected. The way the horse stands is influenced, moreover, by the proportion of the foot and its angle to the limb that it supports. If both are correct, the horse will stand and move with ease and grace. Hence, in truing, balancing and shoeing its foot, one should have some basis to start on that is forthwith reasonable and rational, and, instead of taking the foot in hand, squinting down over the surface, it is preferable to stand the animal bare-footed on a perfectly level floor and ascertain the correctly proportioned angle by looking down the leg and making sure that it is in the center of the foot; then inspect it for the same purpose from the side view, and, from this observation of the limb, note what its pose is in the foot. Having thus obtained an idea of what would seem the proper proportion, and the right angle of the foot to the limb, the shoe should be adjusted to the foot in such a manner that it will accurately correspond with these. As the hoofs of no two horses are exactly alike, however, it is well, before fastening or applying the shoe to a strange horse, to have some one move the animal both on a walk and on a trot, and look sharply the while to see where the horn of the hoofs need paring the most and where the least. A newly shod horse, unimpared in any way, should stand so that the lower or under surface of the shoe is about even with the surface of the frog of the foot; its feet will then strike squarely on the ground when it moves, and, on farms and country roads, the calks sink sufficiently into the earth for the frog to hit at every step, as well as the shoe, and thereby produce the requisite amount of concussion on the frog to keep the internal organs of the foot in healthful action. Only in case of certain forms of lameness should high heels be put on, and, if the horse interferes or cuts its ankles when traveling, it may be advisable in dressing the foot to pare down the outside as low as possible, and leave the inside high. A shoe with a spring heel should be had for summer, set, when fitted, in a little of the foot, and during winter the inside calk should be raised the highest. Not that a horse strikes or cuts itself with the heel of the shoe; rather it does it, in traveling, with the side of the foot, side of the shoe, or the clinches of the nails, and the more frequently when the roads are rough and uneven. In shoeing an interfering horse, it is noticeable that when it sets its foot down on a level floor one ankle will incline out, and as the other foot passes by it will not strike. Many ailments of the horse, like windpuffs and spavin, are due to bad shoeing, and such a complication of difficulties may be caused by it as to result in laminitis, or founder.

The shoes in such a case should be pulled off and the local inflammation reduced with poultices. If it occurs in summer, turning the horse out to pasture is advisable, and if in winter, keeping in a roomy box-stall, with an earth floor, and giving exercise out of doors daily; the frog of the foot will thus be brought into natural action again. Too much attention can hardly be given to the feet of colts.—Pacific Homestead.

FLORICULTURE AND GARDENING

[BY ERNEST BRAUNTON, GLENDALE, CAL.

LOCO WEEDS.

Editor Cultivator:—I note in the papers that cattle on Catalina Island are going crazy from eating "loco weed." Please tell me what the plant is like and if it occurs on the mainland.—E. D. G., San Pedro.

We have not seen specimens of this island "loco weed" (and would like a plant with blossom and mature pods very much) but we presume it is one of the Astragalus family, commonly called "rattle-pods" or "loco weeds." We have at least sixteen species of Astragalus in this country alone and it is not known how many are poisonous. They are generally more fatal in desert sections. They are wild peas, usually perennial with blossoms of a variety of colors, light yellow being quite common. The pods of all poisonous species are inflated and when seeds are ripe, will rattle when disturbed, hence their common name. No doubt the species referred to occurs on the mainland.

* * *

MUTILATING CONIFERS.

From the artistic as well as physiological point of view, it is barbarism to remove the lower branches of conifers (cone-bearing trees), which the tree needs to shade its trunk and standing room, and often, when deprived of the same, will replace first before starting again in its height growth.—Prof. B. E. Fernow, Director, College of Forestry, Cornell University.

* * *

LANDSCAPE GARDENING.

Many people are unable to distinguish between landscape gardening and gardening proper. The first is a profession, the latter a trade. The late William Saunders, Supt. of the gardens and grounds of the United States at Washington, D. C., says: "Landscape gardening is a comprehensive art, combining the genius of the landscape painter with the art of the practical gardener. The professor of this art should also possess a competent knowledge of the general principles of botany, architecture, geology, hydraulics, hydrostatics, mechanics, laws of heat and ventilation, horticulture and vegetable physiology." Prof. L. H. Bailey says: "Landscape gardening must be sharply distinguished from gardening. The former is the making of pictures with plants; the latter is the growing of plants without reference to the picture. In one, the interest centers in art, in the other it centers in plants."

THE RAISIN MARKET.

The Fresno Republican contains a statement made by Mr. Chaddock, who has just returned from a trip to the principal raisin markets in the East. As will be seen from reading the article, a hopeful view is taken for increased prices this spring, as Thanksgiving cleaned up the market and opens the way for what appears to be an active trade soon.

"My trip," said Mr. Chaddock, "was partly for the purpose of investigating the condition of the raisin market, and I found that the market was pretty well supplied. That was with reference to the supply for Thanksgiving. Jobbers were pretty conservative with regard to buying and there seemed to be an impression that prices were as high as they were likely to go. Last year, they had views as to the fight among the packers that gave them the impression that prices were likely to be higher. So they loaded up at the then prevailing figures.

"When I was at Kansas City, I saw carloads of these raisins taken out of cold storage, where they had been ever since last January. I found the market the same at St. Louis and at Pittsburg. Large stocks had been carried over and speculated on. The Thanksgiving trade has pretty thoroughly cleared up these stocks, however. They were principally seeded raisins and, as I say, carried over in cold storage. It seemed strange that they had kept as well as they did.

"There are not any very large stocks left in the East, which is the result of the extreme conservatism of the buyers. The shortness of the stocks, therefore, will result in a condition this coming spring that was absent last spring. Then the buyer had loaded up with heavy stocks and had no desire to purchase more. Now they are short of raisins and I expect to see a brisk spring trade."

The War Department has agreed to pay the Friars of Luzon, $7,250,000 for all their land on the island, except one sugar plantation, near Manila.

GO TO GARDENA

Gardena is located in the center of the broad fertile valley between Los Angeles and San Pedro; has two electric lines giving the very best facilities for marketing products.

It is without rival in regard to climate, soil and water supply.

The soil is adapted to berries, alfalfa, vegetables, walnuts, etc.

To illustrate what can be done, we visited the model ten-acre ranch home of Messrs. Burge and Michael near Gardena. They kindly gave us an itemized statement of sales of produce for the year 1903. The walnuts (nearly 4 acres) were sold for $731.79; small fruits, vegetables, hay, chickens, eggs cream, etc,, $818.77, making a total of $1,550 56. Can you ask for a better investment?

For Sale, 10 Acres, $4500

House of 6 rooms, barn, farming tools, hay in barn, 1 horse, chickens etc. One acre in alfalfa, balance in orchard, mostly apricots. $2,000 cash 6%, good time.

5 Acres, $2,000

Three acres young strawberries balance alfalfa and garden. Horse cow, buggy and farming implements

5 Acres, $1,400

Two and one-half acres new straw berries,

20 Acres, $2500

One acre strawberries, 3 acres appl orchard; 7-room house; barn. Eas terms.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset wit bearing fruit trees. Berries, one acr of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, en trance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant Good celery or alfalfa land. A bargain

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house barn, etc. Berries, alfalfa and fruit Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house sheds, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house and barn, pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

W. M. GRAY
Gardena, Cal.

WHAT MATTERS IT?

What matters it though all the world go wrong?
Somewhere the birds are lilting out a song.
What matters it though clouds hang low and dark,
Through swirling waters glides our lonely barque?
What matters it; for somewhere just beyond
A rainbow dips into a crystal pond;
The tinted arch the gate of heaven spans
And love awaits to clasp our groping hands,
To smile into the eyes all dim with tears,
To hold us close through all the coming years.—Edith Hall.

A TOUCH OF POETRY.

It was hot—very hot. The car was close and cindery. An overdressed girl across the aisle was chewing gum, working her jaws to the exasperation of the beholder; a commercial traveler who carried a "line" of perfumery, was testing his samples, and heavy wafts of sickish sweetness floated abroad as he sniffed; a baby was crying; a small child patrolled the aisle, lurching around curves, and occasionally tumbling over ends of projecting dress suit cases; an apoplectic old gentleman, with rolls of pink fat at the back of his neck, drowsed uncomfortably, waking himself from his naps with explosive snorts; a thin, pale woman leaned back, looking faint, with a fan in one hand and a vial of salts in the other. The mercury stood at ninety-five.

"Oh, dear!" moaned one of two women traveling in company; "isn't this dreadful? The heat alone is killing; and then it's all so stuffy and sordid and hurried and hateful! We rush and we suffer, and there isn't even an alleviation.

"It makes me remember my traveling abroad last summer about this time. We didn't hurry. Much of the way we coached, and the temperature was perfect. Everybody was comfortable and polite, and all sorts of pretty, poetic little things kept happening that it is a delight to remember.

"Let—me—see. This is the fifteenth, isn't it? Well, on the fifteenth we were coaching in the lake region, and the dear little rosy-faced English children ran after the coach, and tossed sprigs of red rowan-berries into our laps. Of course, we threw them pennies; but it didn't seem like mere buying and selling—it was much more charming and poetic."

The train slowed up, and the water-lily boy got on the train—a homely, thin-shanked, bare-legged, red-headed little youngster, with an armful of sweet white lilies, cool green pads and trailing red-brown stems. A suggestion of crystal waters, quiet coves and dipping boughs seemed to float in with their fragrance.

The woman bought; the apoplectic old man chocked himself awake, and nearly had a fatal attack in his struggle with his pocketbook. The drummer banished his bottles, and the chewing-gum girl her soiled paper novel, and both bought flowers. The pallid woman, in a burst of extravagance, took a dozen, and buried her face in them. But the tired mother with the baby and the tumbling child could not afford any, although she looked longingly, and the baby clutched for them. The boy noticed, "Want some, kid?" he said, laying a generous bunch in her lap. "Plenty more in the pond, ma'am; and my own kid brother always likes 'em." He tucked yet another in the hand of the bigger tot, who sucked the cool stem in solemn wonder, and then, hastily slipping out of the door, he swung himself off the step as the train started.

"That was better than the rowan-berries," said the traveled woman, softly.—The Youth's Companion.

LESSENING WOMEN'S LABORS.

It is no wonder that housekeeping is now regarded as the most honorable and exalted position woman can occupy, for it requires so many qualifications of head, heart and hands. The duties of the farmer's wife are many and very complicated. The morals, health, business, happiness and success of the family depend, to a great extent, upon her qualifications. The care-worn faces and bended forms we see among them are proof that their work not only needs simplifying but also improving by better methods and more general knowledge and scientific understanding of their work.

Educated women are now paying attention to the details of housekeeping and intelligently investigating its needs. They no longer regard it as work fit only for the coarse and ignorant, but work that is worthy of the time and attention of intelligent hands The farmer's wife would save herself much time, labor and expense and prevent many troubles and failures if she would study the laws of health, hygiene and chemistry of food.

One of the greatest drawbacks to the farmers' wives of the present time is they devote all their time to physical labor in supplying the physical needs of the family; that is, food, raiment and shelter. We rural women should have a higher ideal of our duties and place our lives upon a higher plane, and devote equal efforts and attention to the culture and development of the moral, intellectual and spiritual nature.

The farmer's wife needs to cultivate the social side of her nature. Time should be taken for pleasure, reading, riding, visiting, entertaining and for reflection. All this may appear to make their lives more burdened and complicated, but instead it develops the different parts of their nature and makes them and their houshold more intelligent, happier and useful and more respected. Much of the work can be abbreviated, and oftentimes omitted without any loss of comfort and money. Knitting, unhealthy fancy cooking and tedious fancy work are not necessities and should be omitted where one's time is limited. Clothing can be made plain and look just as well and save much time in sewing and laundrying. Woolen carpets can be dispensed with in dining room and kitchen and oil carpets and linoleums substituted. This will save much work and dust. Patchwork quilts, which require so much time to make, are no longer needed, as heavy colored bed spreads, cotton blankets and light weight comforts are just as good and so much cheaper.

Entertaining would be more pleasureable and at the same time robbed of its terrors to the rural woman if plain simple refreshments were served instead of elaborate feasts. Simplicity has always been the emblem of true culture. Take time for reflection and not allow every moment of it to be spent in perpetual confusion. Thus if the work is simplified all around, there will be time to devote to the culture of the intellectual nature while at the same time the body will be enjoying a much needed rest. Provide books and magazines, for we can no better afford to starve the mind than the body. Housekeeping is too often attempted by those who have given no attention and study to the practice of the art, and, as we have said, it is a complicated occupation, for it includes cooking, sewing, laundrying, social study, accomplished entertaining and congenial companionship.—C. W., in Indiana Farmer.

DIET FOR SICK CHILDREN.

Many times a discerning mother may cure her child of slight illness by giving homemade medicine to them, and by dieting them. Indigestion is perhaps the most common ailment until the children are three years old at least. When an apparently healthy nursing baby throws up its food, it nearly always is a sign that its stomach is overloaded. The mother either should not let it nurse so often, or should not let it nurse so long at a time. Some infants do well by having three-hour intervals between feeding. Others must be fed every two hours. Mothers must study their babies. The theory now is that babies must be trained. So they should, but it must be inherited from their mothers.

When a child has been weaned and is troubled with indigestion, the food must be studied. Sometimes merely diluting the milk and keeping the little ones on toast and milk for a day or two will stop all the trouble. In diluting milk for a child troubled with nausea, one may substitute barley water or oatmeal water for the greater part of the milk. To prepare oatmeal or barley water, take two tablespoonfuls of the cereal to two quarts of water. Let it cook down to one quart of liquid, strain and use three parts of this liquid to one part of milk. As the child's stomach regains its normal conditions, the oatmeal or barley water may be made one part and the milk three parts. Oatmeal water is good where there is constipation, and barley water is excellent where the bowels are too loose.

In cases of severe or acute indigestion, when the child cannot retain anything on its stomach, I have found the following simple remedy most excellent. Cover well with boiling water several slices of dried beef. Let this stand ten minutes. Then give the liquid to the child at half hour intervals, beginning with one teaspoonful at a time and gradually increasing the dose to four or five teaspoonfuls. The salt relieves the nausea, and the nourishment obtained from the beef makes it unnecessary to give any other food. When the vomiting has been checked, the piece of beef is excellent to give the child strength. It also is good for the stomach because it does not irritate it. Take a piece of beefsteak, slash on both sides with a sharp knife, and sear on both sides either on a broiler over a hot fire or in a frying pan. Where a frying pan is used it should be hot enough to smoke before putting the meat into it. Do not use any fat, but rub the pan with a piece of suet to prevent sticking. Turn the beefsteak constantly and leave over the fire just long enough to brown it. Then put through a meat press. If you have no meat press, lay the meat between two plates, put a heavy flat-iron on the top, and let it stand a few minutes. Drain off the juice that collects and give in teaspoon doses the same as dried beef water for a couple of hours, and then give every two or three hours. When the child is well enough to take solid food, it is well to begin with a thin slice of toast moistened with beef juice, diluted milk or broth. See that there is no grease on the broth, however. I have cured some severe cases of indigestion in my own family by using first dried beef water to stop vomiting, then giving the juice from beefsteak to keep up strength and regulating the bowels by barley and oatmeal water.—Nevada Davis Hitchcock in Ohio Farmer.

Madge—He stole a kiss from me.
Mabel—Well, that was only petit larceny.
Maud—It wasn't—it was grand.

"Don't you think that young man is afflicted with a swelled head?"
"No," answered Miss Cayenne; "he's not afflicted with it; he enjoys it."

RECIPES

Eat Little, but Have That Little Good

APPLES.

Apples are now at their best. Use them freely every day. No pie is more acceptable than a well-made apple pie, but the fritters and puddings, for which directions are given below, are an agreeable variation.

Apple Fritters.—Beat one egg until very light, add one-fourth cup of milk, one tablespoonful of melted butter, one fourth teaspoonful of salt and flour sufficient to make almost a drop batter. Beat it thoroughly and let it stand at least an hour to swell the flour. Beat again just before using. Pare and core three apples, cut in half-inch rings. Sprinkle with sugar and spice. Dip each slice in the batter, taking up only as little as possible, and cook in deep, hot fat. Sprinkle with powdered sugar and serve with roast duckling.

Apple Pudding.—Pare, core and chop fine enough tart apples to make one pint. Mix with them one cup of stale (not dry) soft white bread crumbs. Beat the whites of four eggs until stiff, then beat the yolks until quite thick, add to them one-fourth cup of sugar, which has been creamed with one tablespoonful of butter, add one-half teaspoonful of salt, one-half teaspoonful of allspice. Stir this into the crumbs, then add the whites, and when well mixed pour into small cups, well greased and let them steam one hour. Serve hot with hard sauce.

MOTHER'S SCRAP BOOK.

Sore throats should always be closely watched. Mere tonsilitis in one child can cause diphtheria in another. Allow no exchanges of partly chewed gum! (filthy trick!) and never encourage over familiarity and kissing among ecqualntances of your children.

Wide and various are the treatments for diphtheria and sore throat. The pure bred disease can kill in twenty-four hours. Kerosene is often used mixed with sweet or olive oil and applied, with thorough but gentle rubbing, to skin of neck. Some have even swabbed sore spots on the tonsils with clear kerosene. Sulphur burned on hot coals and the fumes inhaled, and a swab or gargle of sulphur besides, is a very good remedy. After using sulphur always beware of catching cold.

In home treatment with homeopathic remedies named before, I have had great success and quick recovery with Nos. 34 and 1. As it leaves blood much poisoned, an after course of Red Clover Tea is very wise, and remember one needs to be quiet for a long time after having diphtheria. In diet avoid all meat, but for strength afterward nothing excels Bovinine in Grape Juice.

Poultices of pokeroot (the fresh root pounded and mixed with hot flaxseed or cornmeal is best, though the fluid extract can be used), are commended for bad cases of croup of diphtheria sort. To inhale steam from a pitcher of boiling salaratus water is very good when abscess threatens.

A cold compress is the quickest real aid in ordinary croup. It has helped also after failure with hot fomentations, baths, teas, ipecac, etc. A hot foot bath is always good. To use cold compresses have a square of old flannel wet in cold water and lightly wrung. Over this wind a piece of cloth, flannel preferred, round the neck. Renew when warm. Two or three usually end trouble. Some children inherit the predisposition to croup, also to asthma. These, though healthy enough and despite good diet, etc., seem doomed to frequent attacks when damp raw winds prevail, and they should not be out after dark. They seem to outgrow it in time. It is wise to give such a footbath, light supper, and rub well whole neck and chest with warm oil or lard with a few drops of turpentine. If a fresh cold seems likely this will nicely nip it off, especially if a dose of rhubarb be given to move bowels by morning and a parting "good night tea" drunk hot, of sage and peppermint, or of lemon.

Prevention is always safest. Colds are the beginning of too many serious diseases, especially where the bowels are neglected and the diet is heavy.—Victoria Wellman.

THE CHRIST THAT IS TO BE.

"Christmas, with its old yet ever new and marvelous mysteries" has come and gone and found the old old world just as merry, just as full of gladness as when on that glorious, starlit night in Bethlehem, the King of Glory lay on his mothers' knee and the Angels sang that wonderous song, "Peace on Earth, Good Will to Men."

This is a time when the heart becomes tender, and thoughts go out to the poor and the lonely, and the wish is strong as wish can be, that into each life some joy may come. Beautiful is the inspiration which leads us to offerings of love on this day of hallowed memories, and happy are we in the thought that it is "more blessed to give than to receive." The Swedish story written tells us that every Christmas eve, exactly at two o'clock the cattle turn their heads to the east and kneel down to worship the king supposed to be cradled in the manger. Beautiful and right it is that gifts and good wishes should fill the air like snowflakes at Christmastide. And beautiful is the year in its coming and in its going—most beautiful and blessed because it is always the year of our Lord.

On this Christmas time when good cheers abounds, when the home is decked with holly and the yule log burns bright on the hearth, let us turn our thoughts within ourselves and take account of our spiritual condition. The world today demands of every individual more of the spirit of the Christ king. Love for our fellow men; desire to do unto others as we would have others do to us; abounding virtue and benevolence; these are the elements that must work the moral regeneration of society and the millennium when the world shall recognize the Christ that is to be.

A woman who suffers from perspiring palms lines each glove with a piece of very thin oil silk covered with thin muslin. The silk is pasted down on the inside of the glove with just a suspicion of pure gum arabic mucilage applied so dry that it cannot stain through. Oil silk is the material of which the ordinary dress shields are made. She says the presence of the lining is not noticeable in any way when the glove is on the hand, and works marvels in keeping the hand covering intact.

Don't add stale bread and butter sandwiches to the crumb basket. Put them into a toaster still laid together and toast rapidly over a clear red fire on both sides. Serve hot. You will find them delicious, crisp outside, soft, warm and buttered inside. If it is a sandwich which has a chopped meat or nut mixture between, toast in the same fashion, then pour over a hot thin white sauce. This makes a delicious luncheon or supper dish.

In trying to hem liberty silk on the machine, women have great trouble because of its being dragged into the feeder and chewed up. The idea of putting a strip of paper between the cloth plate and the liberty silk and sewing them together remedies the evil, as the paper may easily be torn away.

NEVADA'S GREAT ALUM OUTPUT.

The largest alum deposit in the world is said to be located in Esmeraldo county, Nevada. It is over 100 feet wide and the operators are not more than one-half way through the ledge. The greater part of it is pure crystalized alum.

Worse Still.

Mr. Stubb—Here is another woman who insisted that the word "obey" should be left out of the marriage ceremony.

Mrs. Stubb—Well, I don't think it should be left out.

Mr. Stubb (surprised)—I am glad to hear that.

Mrs. Stubb—No, I don't think it should be left out. I think the man should say it.—Chicago Daily News.

The foreign demand for American wheat is light, because good crops are now raised in other countries. Since April 1st, British India shipped 30,000,000 bushels; Argentina, 60,000,000, and Russia 32,000,000 bushels.

Mullen & Bluett Clothing Co.
FIRST AND SPRING LOS ANGELES, CAL.

Los Angeles Markets.

Los Angeles, January 7, 1904.

The dry, cold weather has had a marked effect on the vegetable market. Some varieties are exceedingly scarce. Seasonable rains in the northern part of the state keep feed at about the prices quoted last week. The vegetable market there is lower. In this city green peas and lettuce meet with small demand and are lower. Tomatoes are also weak, though good qualities are readily taken.

Yellow sweet potatoes are getting very high; 3c is asked for the best, and fancy white are selling as high as $1.60.

Eggs and butter remain at about former quotations. If the dry weather continues we may expect a slight advance. Dairymen have advanced the price of milk from $2.75 to $3.00 per quart per month.

Eastern Markets.

Grain and Produce.

CHICAGO, Jan. 6.—War news ruled the wheat market today. Reawakened fear of hostilities in the Far East caused an excited opening, and prices were much higher. Shorts were extremely anxious to cover, and there was also a good demand from commission houses. No one seemed willing to sell, while buying orders appeared to come from all sides. The immediate cause of the urgent demand was a decline in the price of English consols, indicating that the war situation was regarded as most critical. Cables also were higher. Receipts were light, notwithstanding the fact that weather conditions were favorable for the free movement of crops. On the profit-taking, the market settled back.

Cash quotations were as follows: Flour was strong; No. 3 spring wheat, 76@85; No. 2 red, 87½@88½; No. 2 corn, 44; No. 2 yellow, 45½; No. 2 oats, 36⅝@36¾; No. 3 white, 36½@28½; No. 3 rye, 53; good feeding barley, 36@37; fair to choice malting, 43@58; No. 1 flax seed, 98½; No. 1 Northwestern, 1.05; prime timothy seed, 2.90; mess pork, per bbl., 15.50@13.62½; lard, per 100 lbs., 6.80@6.85; short ribs, sides (loose), 6.37½@6.62½; short clear sides (boxed), 6.62½@6.75; clover, contract grade, 11.25.

Chicago Live Stock.

CHICAGO, Jan. 6.—Cattle, receipts, 23,000; good to prime steers, 5.10@5.15; poor to medium, 3.75@4.90; stockers and feeders, 2.50@4.25; cows, 2.00@4.00; heifers, 2.00@4.85; canners, 2.00@2.40; bulls, 2.50@4.50; calves, 3.00@3.25. Hogs, receipts today 45,000; tomorrow 40,000; 10c lower; mixed and butchers, 4.60@4.90; good to choice heavy, 4.50@5.00; rough heavy, 4.50@4.70; light, 4.30@4.65; bulk of sales, 4.60@4.80. Sheep, receipts 20,000; sheep and lambs slow; good to choice wethers 4.00@4.60; fair to choice mixed 3.25@4.00; western sheep, 3.65@4.50; native lambs, 4.00@6.25; western lambs, 4.60@6.25.

DAIRY MARKET.

On the Produce Exchange today the butter market was easier; creamery, 16@23; dairy 16@21; eggs, firm, 25@28; cheese, steady, 10@10½.

California Dried Fruits.

NEW YORK, Jan. 6.—Evaporated apples are in light demand, prices are steadily held; common are quoted at 4@5; prime 5⅛@5½; choice 5½@6¼; fancy, 6½@7. Prunes are quiet and prices ruled steady at from 3⅝@6½, according to grade. Apricots attract only light demand, but are firmly held with choice quoted at 9¼@9½; extra choice 9¾@10¼, and fancy held at 11@15c. Peaches are firm; choice are held at 7¼@7¾; extra choice, 7¾@8¼; and fancy, 10¼c.

CITRUS MARKETS

THE ORANGE MARKET.

The market during the past week has been very seriously handicapped by the extremely cold weather prevailing in nearly all parts of the country. Arrivals, however, have not been very heavy, and it was only necessary to move fruit in limited quantities at the other end of the line. Heavy shipments are about due in the different markets and conditions are unfavorable. Auction markets have been in bad shape and sold but limited number of cars during this week on acount of the weather conditions. Much of that which is arriving is old stock and bringing low prices. Strictly good stock bringing quite satisfactory prices. The western markets are doing fairly well under the circumstances.

THE LEMON MARKET.

The lemon market continues in the same unsatisfactory condition, with practically no demand, a condition, however, that could hardly be expected to improve with zero weather.

AUCTIONS.

NEW YORK, December 28, 1903.
C. C. U. Exeter, Antelope Navels, $3.35. Mariposa Navels, $2.75.

Total to date this season, 2223 cars, of which 324 are lemons. Total to same date last season 2261, of which 387 were lemons.

Under date of January 5, local forecaster Franklin writes:

There was practically no change in the weather conditions during the past week from week previous; warm days and cool nights, with frost, continue. The frost was not severe and no injury resulted to citrus fruits Oranges are well colored and moving freely to market.

The lack of rain is apparant in failing pastures and irrigation to the limit of the supply, which is ample and up to the usual quantity for the time of the year.

The weekly reports continue to be few in number, owing to the drought, and will be until the rains come, as farm work is at a standstill and there is but little for farmers and ranchmen to say.

J. C. Gookins, who is a field agent for the A. R. Coulson Co., says that he can always tell the sections in which the Cultivator circulates the heaviest. The knowledge of the Coulson foods is largely extended through the Cultivator and this is most apparent when a household is visited in which the Cultivator is. We believe this is true of nearly all the advertisers that are able to trace results in advertising. The Coulson Company are now shipping about a car of poultry foods per day.

I WILL GIVE $1000

IF I FAIL TO CURE ANY CANCER OR TUMOR

I treat before it Poisons Deep Glands or Attaches to Bone.

NO KNIFE OR PAIN, NO PAY UNTIL CURED.

NO X-RAY OR OTHER SWINDLE.

A Pacific Island shrub or plant makes the cures—the most wonderful discovery on earth to-day. **3000 CANCERS** cured on people you can see and talk with. **ANY TUMOR, LUMP OR SORE** on the lip, face or anywhere six months is, *nearly always*, Cancer. Poor cured free if cancer is very small on face.

ANY LUMP IN WOMAN'S BREAST IS CANCER

It does not pain until almost past cure, and if neglected it **ALWAYS** poisons the deep glands in the armpit, then it is often too late and still no pain. Deep in the shoulder death is certain. In 30 years I have cured more cancers than any other Doctor living. **INVESTIGATE MY ABSOLUTE GUARANTEE. BE SURE TO GET MY 120-PAGE BOOK,** sent free, with symptoms, addresses and testimonials of thousands cured, and write to them.

JAMES WATERS, Prop. **Watsonville, Cal.**

"ITS PENNY WISE"

Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it, when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 450 Santa Fe ave., Los Angeles.

DANDY Bean Picker.

Hand-picked beans bring double price. Make $2 to $3 a day picking them over at home in winter months with the **Dandy Picker.** A special tool for a special purpose—best of kind in the world. Description free.

LUTHER BROS. CO.,
11 Mill St. N. Milwaukee, Wis.

A. B. C. INSECTS.

(Continued from page 29)

Strawberry Grubs.—F. H. Hall, Escondido, sends strawberry plants, attacked by grubs. He also sends the grubs. They are doing serious damage in the strawberry plantations. He says he has not applied manure and yet the grubs are doing him serious harm. The insect proves to be the common white grub of our California lawns and strawberry beds. This grub feeds for two or three years and there are two sizes among those sent by Mr. Hall. It is true that treating strawberries with stable manure often brings these grubs, as they can feed on either stable fertilizer or roots of plants. Yet the eggs are often laid by the beetle among the plants or in the grass of the lawn, in which case of course, they will appear without the manure. It is hard to give a remedy except to move the bed, though I presume the bi-sulphide of carbon might be used so carefully as to kill the grubs and not greatly injure the plants. A careful test would prove whether this be true or not. Were I a sufferer, I should not hesitate to make the experiment and should expect to succeed. I shall hope to give an illustrated article on this insect for the Cultivator soon.

* * *

Gophered Trees.—F. R. Miner, Tropico, asks when to cut back gophered trees. The object of cutting back is to preserve a balance between roots and branches. As soon, then, as it is discovered that the roots are injured, so soon should the branches be cut back. Mr. M. also wishes to know if it is well to prop up late Valencias in localities where there is little wind. Certainly, if there is danger of the trees breaking down, else, no. He also wishes to know if the tri-foliate stock has been proved superior for this region. I think not. Some claim excellence for it. It should not be extensively planted without further trial.

CRUDE OIL FOR PEACH BORERS.

Subscriber, San Jose, states that peach trees are being painted with crude oil in his neighborhood from the earth line down as far as the insect works. He says this seems to be effective but that the peach growers fear injury to the trees. He asks advice in the matter. I used in Michigan crude oil and crude carbolic acid in similar fashion years ago and experienced no harm and more or less of success. I should expect no more harm from the use of our crude oil than from that of the East, yet in all such matters, it is best to keep a sharp eye out for injury. In our use of distillate spray, the spray always runs down the trunks of the trees, and seems to do no harm, though I have heard complaint of injury where a large over charge was used. If I were T. H. D., I should have little fear in such treatment of my trees. Let me say, however, that in quite an extended line of experiments in Michigan, I found nothing equal to digging out the peach borers doing the work both in autumn and early spring that any borers left in the first search might not escape destruction. The gum at place of attack quickly reveals the presence of the borers.

The same writer asks if similar painting will injure prune, cherry, peach, apricot, almond, and plum trees, except where it is used above the ground line. Here again I should have little fear of injury. It certainly would not if diluted. I do not think it would increase the danger from sun scald. Neither do I think it would injure to paint below the ground. Nor do I think injury would result if the main roots were left exposed for a few days. Of course we must remember that the normal condition of roots is to be covered up. The writer says that an answer to these questions will please several hundred subscribers.

San Dimas Citrus Nurseries

Simply the Best Citrus Trees

You do not go to a millinery store when you want carpet tacks; nor to a butcher shop when you want a pair of spectacles; nor to a cattle breeder when in want of a canary bird;

It's Not Business

If a land owner contemplating planting a citrus orchard, or a grower wanting to replace a few trees in your orchard or to make an addition to your acreage, you believe in so planting and conducting your business that it will give you profitable results; this means that your judgment will only tolerate the best of citrus trees,—which are the only kind we have to offer.

That's Good Business

You believe as a business man that to buy only the best at prices no higher than many inferior trees is not only good common sense, but a profitable thing to do. Twenty years experience in the growing of citrus trees warrants us in saying that our stock is the best from every point of view that is to be had on this market, while our prices—quality considered—are easily the lowest. These truths are self evident, and are more freely explained in our sumptuously illustrated monograph on citrus culture, a copy of which is yours for the asking.

Correspondence from intending planters solicited, and special prices on large contracts cheerfully furnished. Write today.

PRUNING THE ORANGE

A Paper Prepared by Charles R. Paine, of Redlands. His Own Orchard is the Best Proof of the Worth of His System.

It was the pleasure of one of the Cultivator staff to recently visit Mr. Paine's place, between Redlands and Crafton, and the thrift of his trees was such a striking proof of the worth of his system of pruning that photos were made to use in illustrating the article, which, with some minor changes, is the same as read before the State Fruit Grower's convention held in Los Angeles in May, 1903. We trust they will add to the pleasure in perusing the article.

Mr. Paine writes us that the present is an especially opportune time for this paper as this is the season when the pruning should be done. If ripe fruit can be removed it should be done at once, as it will aid in the setting of the new crop. If pruning or other disturbance of the condition of the tree, such as deep plowing and cutting of roots, etc., occur at blossoming time it is probable a light crop may be had. Have the tree in fine condition at blossoming time, then leave it severely alone till fruit is set, excepting that, pruning may continue into the summer.

Mr. Paine's paper is as follows:

Pruning fruit trees and vines to improve the product is a very common practice, known from a distant period. The orange tree in its youth has done so well with little or no pruning that the practice has been quite general to let it go virtually unattended in this respect, at least until some irregular growth demands removal. Many orchards, perhaps most, have passed from youth through years of bearing satisfactory quantities and qualities of fruit with so little increase of care in pruning, so that a habit has been formed among many of regarding the pruning of an orange tree as a species of work rarely necessary.

There arises the question, occasionally, whether it is worth while to undertake the "appalling task of getting into the inside of an old orange tree to saw and cut off and drag out the dead wood." Perhaps it is not, if that is all that is contemplated by pruning. It gives content and repose to consider that it is nature's way of disposing of old and useless growth by deadening it; the brush takes but little room and does no harm. There is, however, one kind of cutting that is usually done, for it is plainly seen that it is a misdirected energy of plant life, that is the removal of suckers from the body of the tree. Neither sort of interference with the tree is a result of a studied system of pruning the orange either for the good of the tree, as a regular and thrifty fruit bearer, or for the good of the owner, in producing the best quality of fruit.

More Pruning Favored.—There are some exceptions to this general custom, who have founded their practice on good judgment and experience, and I think the tide has turned in favor of more pruning than in earlier times. But the minority is a small one who have reasoned, observed and acted according to sound reasoning and careful observation in regular pruning of the orange tree as a necessary feature of the work to be done in securing the best outcome; and few there are of this minority who can cut, with that unconcern which marks the pruner of deciduous fruit trees, the limbs or twigs that have any promise of fruitage.

There is no reason in laws of growth why the orange tree should be an exception to the general rule that pruning should be done to secure: "(a) Convenience of the grower; (b) Health and strength of the tree; (c) Regulation of heat and light; (d) Attainment of strong bearing wood; (e) Attainment of size and quality of fruit, and (f) Promotion of regular bearing." I quote from Wickson's "California Fruits," the best authority in the State, the above statement of the objects of pruning. They were made with especial reference, I presume, to deciduous fruits.

Note that the main fruit-bearing branches are encouraged, while the secondary and useless ones have been cut off, leaving all the sap to flow to thrifty, fruit-bearing wood.

This style of pruning brings fruit.

There is no orchard work more systematically and thoroughly done in California than the pruning of deciduous fruit trees, particularly by those engaged in growing the fruit for eastern shipment. There is no work of the sort more uniform over large areas of orchard. By this means, as could be done by no other, fruit of fine quality and good average size is grown of such value as to stand shipment across the continent. Thinning, to be sure, is an adjunct of this process, but not sufficient by itself. In fact, pruning of this or any kind of fruit tree, is one form of intense culture.

It is generally agreed that pruning is an essential for excellence of results. Man is satisfied only with the best products obtainable by the most skillful and costly efforts in directing nature's forces. A good market is impossible without prime quality. Quantity is an acceptable accompaniment to the grower.

There is no doubt that in any given locality, favorable seasonal conditions are the first requisite in fruit culture. Man can combat unfavorable weather by slightly protective or modifying measures only. It is left with him to improve varieties, to till and fertilize the soil and train and care for the tree or vine that bears his fruit. He early learns that nature is not a fruit grower, but a seed producer. She is a good mother, but it is not her forte to be a disciplinarian, in the fruit man's business, at least. If he forgets this fact, or neglects to act upon it, nature may do well without his aid, for a time, while the plant is young, and grow the fruit as man delights to have it, as well as the seed for reproduction. Eventually, she falls back upon the performance of her function, with undesirable results for the fruit grower. Then wisdom comes to him and he so directs the energies of growth that a fruitage rich and fair is the reward of his labor and his skill. May it be so with the orange grower.

Improvement Needed.—There is no question that we need to improve the quality of our oranges. A better orange than the Washington Navel may some time appear, but it is now this superb variety which has come to need improvement—for there are far too few of them of that high quality we once knew. In the most crowded market high grade fruit is the kind that sells, and sells to advantage. Neither our trees, nor our wagons, nor our packing houses, nor the railroad trains should be burdened with such a disproportion of second grade fruit, amounting, often, to one-half that is grown.

To a certain extent every year this condition is beyond remedy or change; for without doubt the character of the season is the most potent cause affecting the amount and qual-

OF GENERAL INTEREST.

War Clouds Not So Black.—This week shows eastern conditions as unsettled as ever. Hostilities have not broken out between Russia and Japan and negotiations which make for peace are still going forward.

Because the Czar of Russia is determined no war shall ensue, more concessions will doubtless be made and in the end a way will be found which leads to the conclusion of peace. So may it be.

* * *

Tourists Come.—With the mercury at 40 degrees below zero in many of the eastern states and people dying from exposure, no wonder the railroad statistics show west-bound travel increasing each year. Up to this date the statistics show 14 per cent increase over last year and the influx has not reached its maximum yet. This will insure a continuance of the wondrous prosperity which this region is now enjoying; for it is bringing to our matchless country a class of progressive, well doing people whose wealth and thrift are destined to make this the garden spot of the world.

* * *

Will Co-operate in Prune Selling.—The fruit growers of Santa Clara valley have organized a strong movement to protect the price of prunes. Hereafter no fruit will be sold until a committee appointed by the association passes on the price. The valley has been carefully canvassed and the estimate made that the output of prunes this season will not exceed 1000 carloads. while not over 1600 carloads will be exported from the State. The eastern market is also represented short on prunes at this time, owing to conditions which have disturbed the market there this fall. All these things make the prospects good for future strong prices, and the prune growers are putting themselves in position to reap the benefit of the demand later. The movement is one of the most important and most beneficially far-reaching that has been started for a long time in the interests of the fruit growers of the Santa Clara valley.

* * *

Welcome Rain.—The Cultivator last week said, "We are assured of rain." It has come.

Rain fell plentifully in the central and quite plentifully in the southern portion of the state, putting an end to the prolonged dry spell in the lower counties and aiding growing crops in the north. It was the biggest and most general storm of the season, and in view of the benefit which will result, was one of the most important that ever visited California.

With coast and valley counties well soaked, we may expect a revival of pastures and grazing crops.

The farming, dairy and stock interests welcome the rain as a great blessing. In the central coast counties, cattle were dying and the hard ground defied the plow. Enough rain has fallen to start green grass and partly insure a hay and grain crop in Southern California. Stockmen in many places had made preparations to ship their cattle to Nevada, but will now keep them at home. It is believed the rain for the season has just begun and from this on we shall have our full share of it. Let us all rejoice and be exceedingly glad for health and prosperity await the timely rains.

* * *

Benefit of Summer Fallow.—The Agricultural papers in Kansas and Colorado are telling of the startling returns which have resulted in those states from the aid of summer fallow. It has been demonstrated that it is possible to save enough moisture in the soil from one year to enable a good crop to be raised where this can not be done by depending upon the rainfall of a single season. That this is a fact which is regarded as a startling discovery, will seem strange to the great wheat-growing districts of the Pacific coast. The Oregon Agriculturalist says, "the fact has been known to farmers in Oregon and Washington for some years, who, by this plan are enabled to raise every alternate year heavy crop of wheat in distircts in which the total rainfall for a year is only from 12 to 18 inches. In fact, good crops have been obtained when the fall of rain was only about 10 inches.'

In California summer fallow is becoming general, not only as a protector of moisture, but as a method of preparing the soil for the early sowing of grain. Our Kansas and Colorado farmers are just commencing to learn that the most advanced methods of agriculture find their inception in the brain of the Pacific coast toiler.

* * *

The Pajaro Valley Resolutions.—At a meeting held a few days since at Watsonville, the orchardists adopted a series of resolutions on the subject of the sale of wormy and scaly apples in the San Francisco market. These resolutions recite that the markets of these cities are constantly glutted with this inferior fruit to such an extent that but a very small proportionate quantity of first-class apples can be sold and that the inferior stuff is sold at such low prices that little or nothing is netted to the growers. The enactment of legislation to prevent the sale of wormy and scaly apples is demanded to protect clean apples. If the Pajaro apple growers succeed in their efforts to shut such fruit out of the markets of California, growers will then attend more carefully to the cleaning of their orchards.

* * *

Seed Adulteration.—Representative Trimble, of Kentucky, has introduced a bill in Congress to prevent the adulteration of Kentucky blue grass, orchard grass and clover seed.

This bill is of singular importance to the agricultural interests of the United States and it is safe to say that the farmers of the country lose millions of dollars annually by sowing adulterated seed. The loss to the farmer in the purchase of the seed in insignificant compared with the damage wrought in sowing the seed as the result is half a crop and in the majority of cases, no crop at all. There is not one farmer in a thousand who knows that there is any such business being carried on in this country as seed adulteration; as those who are engaged in this business have become so sagacious they leave no trace or evidence of the adulteration, as all the inferior seeds with which the adulteration is made are put through a heating process to destroy the germ of the seed, consequently there is no appearance of the seed that is used in adulteration.

We trust the bill may become a law.

* * *

Oiled Roads Suit.—The city of Redlands has been sued for $25,000, says the Citrograph, for alleged infringement of the patent owned by a company of New Jersey capitalists. In this suit will be determined the question, as the Citrograph says, "whether one can take an old idea and patent it." It will be a novel decision of the courts if they shall so determine. Any patent attached to a commodity which is natural, and which makes for good to the public, adds to its comfort and health ought not to be sanctioned by courts at law. Oil roads are essential to the health of the people of California, and we hope the courts will not decide the patent good.

BY J. W. JEFFREY, LOS ANGELES

IMPERSONAL DISCUSSION.

From time to time the fruit trade papers of the East publish and often magnify the difficulties encountered in conducting the great co-operative plan of marketing citrus fruits. These journals are not always inclined to discuss the whole system, success and failure alike, but frequently dwell upon the prospects of a rapid dissolution of every plan that has not a commission merchant's label attached. We should not attach much importance to the criticisms of these journals, for they are under some obligation to defend the commission system, securing, as they do, most of their advertising support from the commission merchants. On the other hand the coast papers are usually favorable to the co-operators, and only one or two of them have ever come out in open opposition to the Fruit Exchange or the Agency's plan of operations. Two years ago an evening paper published a long series of articles designed to destroy the Exchange. Its objections were followed closely in this department of the Cultivator, and never were the contentions of a paper more thoroughly vindicated than were those of the Cultivator when the whole field of opposition came into the co-operative plan under the name of the California Fruit Agency. The western press has treated the co-operators well and even in the late controversy between the San Bernardino County Exchange and the central organization, and, later, between troublesome members of the Citrus Union and that central body, the California papers treated the troubles broadly and fairly. With such evidences of good favor from the home papers it matters little to the growers as organizations what is said of their policies by the Eastern papers, for the Agency is in charge there and not subject to fits of disorganization when difficulties arise.

Within the last eight months at least three small storm centers within the elements of the California Fruit Agency have been observed—one of them of very recent date. Two have been within the Exchange and the other within the Union, showing that perfection of operation is not possible. No one expects it to be. With these controversies the Cultivator has no part, as it is within the scope of the two wings of the Agency to settle their own difficulties, and, apparently, within their power. The Cultivator, however, has a part with the principles and policies that underlie, and may express a few broadly and without seeming to interfere with matters personal to these controversies. Speaking first for the Exchange, under its method of choosing representatives, the personal equation of the directory from their association boards to the central body in Los Angeles is bound to be higher in ability than the average equation of the stockholders. Every association in the Exchange knows its most competent men, chooses enough of them to form a board and advises with them during the shipping season. One of the abilities of these competent men is to select able men for the District Exchange Board and these select the Board of Control, which has charge of the business of marketing the fruit. The fact that there has never been a case of peculation or scandal or suspicion within the office of the Central Exchange speaks for the efficiency of this form of representation. Secondly, the customers of the Citrus Union have for years selected each his own firm with which to deal, another form of appointing his representative to attend to the marketing of the fruit. For at least a dozen years a majority of the growers have continued dealing with the firms now constituting the Citrus Union, and it is idle presumption now for even a small number of these growers to make trouble after deliberately choosing these firms to do business for them for the last decade. especially when the members of the Union are now prepared to represent the growers through an agency capable of giving fruit distribution upon a plan as near ideal as was ever devised.

The disaffected, if there are any, should pause and try to imagine the situation were the attempt made to sell 25,000 carloads of citrus fruits through the old, hap-hazard methods. Not longer ago than ten years, with one-fifth the fruit of the present crop to handle, the situation was deplorable. Were the growers to revert to these conditions with the enormous output now produced the situation would be absolutely hopeless. Instead of a few croakers, a few possibly with real grievances, there would be thousands running to bankruptcy, commercial chaos supreme and the final ending of a great industry at hand. Only the shortsighted can look into such a future without a panic of apprehension.

Director Alexander G. McAdie sums up the weather conditions to date in a bulletin issued January 18, as follows:

Rain commenced falling Sunday morning and extended throughout the State during the day and night. Heavy snowfall is reported in the mountain districts.

The precipitation in some portions of the south was more than half an inch, and is the first general rain since September. It will undoubtedly prove of great benefit in softening the soil for cultivation, starting grass and improving the condition of orchards. The rainfall this season in some parts of Southern California is reported less than in any season since 1849. Fair crops and grain and hay will probably be raised in the south if later conditions are favorable. The rain was not so badly needed in the central and northern sections, but will be beneficial to grain and feed. Plowing and seeding are in progress in most sections. Grain continues in good condition in the central and northern districts, though its growth is somewhat slow on account of cold weather. Prospects for large crops are excellent. Green feed is plentiful, but growing rather slowly. The reports of heavy losses of cattle through drought have been exaggerated.

The cold weather and lack of moisture have retarded the development of Southern California oranges in many places. Frosts have caused but little damage, owing to timely forecasts. Work in orchards and vineyards is progressing rapidly.

BY J. W. MILLS, ONTARIO, CAL.

CURING LEMONS.

Editor Cultivator: Will you kindly give through the columns of your valu able paper any information you may have on curing lemons? Of course experience is the best teacher, but the experience of others is a great help sometimes.—Subscriber, Sespe, Cal.

Mr. C. C. Teague of Santa Paula has made what most persons would call an unqualified success of curing and handling lemons. He has given this paper his methods, but like most good things they will bear repeating. A visit to his place at Santa Paula is worth the time of any lemon grower.

Mr. Teague says the secret of successful lemon culture is "careful handling." He must believe it, for he has remodeled his washing machine so that he has run eggs through it and out onto drying trays without breaking them, they not having been touched by the hand. Mr. Teague says that washing does not injure a lemon if it is carefully done, but makes it more attractive. He has learned from experience that the proper state in which to keep a lemon for any length of time is where it neither sweats or gets dry enough to shrink. He found, as most growers no doubt have, that when lemons in all the different stages are stacked in the same room, some of them must suffer. This led him to experiment with tents under which he stacked car-load lots. The tents are simply square canvas, rigged with ropes and pulleys so that they may be raised and lowered at will. The lemons are stacked under these tents directly from the washer. The boxes or trays are stacked in doube rows so that with an adjustable jack, access may be had to the center of each box. One man attends to the examination of the fruit and when the condition of it indicates that it is too moist, the tent is raised until the fruit has dried off sufficiently. Mr. Teague has kept lemons for eight months in this way with practically no loss and the fruit came out and carried in first class shape. With his array of tents, he is able to handle each carload differently if necessary, and bring all of his fruit to the proper state and hold it there till he is ready to ship it.

There are numerous little details that continually come up and they must be disposed of to the best judgment of the operator. Mr. Teague's main point is, to keep the lemons just where they neither shrink or sweat. This, in conjunction with careful handling is all that is required to make a good lemon after it is once grown. All minor details should be directed to bring about those conditions.

Mr. Teague's tents are placed on a platform that is about three and a half feet high. Over this platform is a roof. There have been objections to such an arrangement by growers who live in the interior valleys. It is feared that the dry atmosphere that sometimes prevails would dry out the lemons too much. It is very likely that at certain times the atmosphere would be too dry for such an arrangement, but if the building had sliding walls so that they could be removed or closed up quickly, this element would be eliminated.

SCUTELLISTA VS. SPRAYING.

By C. A. Day.

Shall we, after this season, continue the use of distillate mechanical mixture as a spray for red spider, and for red and black scales? Judging from the present condition of things, my answer to this important question would be, no. The work of the scutellista on the black scale is so encouraging that it seems we may count with some degree of certainty on its eventually controlling this pest.

At Pasadena the scutellista has continued to attack the scale in condition, and will probably continue its work through the winter, and furnish flies for distribution throughout the winter and spring. With the establishing of the scutellista in the orchard, spraying with distillate and fumigation with cyanide, must cease, if we expect the parasite to increase in numbers sufficient to destroy the black scale.

When the scutellista has been established in the orchard and it should become necessary to treat the orchard for red spider, the sulphur mixture should be used in place of the distillate. The sulphur mixture is more thorough in destroying the spiders and will not, in my belief, injure the scutellista.

The sulphur mixture is composed of 11 pounds of sulphur, three-quarters pound of sal soda and one and one-half pounds of wheat flour to 100 gallons of water. The wheat flour is made into a thin paste and strained through a fine seive, using one pound of flour to a gallon of water and is then added to the mixture.

A spraying machine with an agitator in the tank should be used, as the sulphur does not go into the solution and the grains of sulphur, by the agitation of the mixture, are kept from settling, and when thrown in the spray on the leaves or wood of the tree, are stuck fast by the flour paste in the mixture. The action of the sun on the sulphur is to continue to release the fumes of the sulphur, which destroy the live spiders on the tree and is effective for several weeks in destroying the young spiders as they hatch from the eggs, until all the young spiders are hatched out, making thorough and complete work of exterminating the spiders. One spraying with sulphur every other year should be sufficient to control the spiders and prevent injury to fruit or tree, provided that adjoining orchards are sprayed at the same time.

For red scale, fumigation is more effective and thorough than the distillate spray, and one good fumigation for red scale should exterminate it, and is cheaper than spraying because it will not need to be repeated in two or three years, providing adjoining property is also disinfected.

The scutellista should not be placed in an orchard infected with red scale until the orchard has been fumigated, as otherwise the fumigation for red scale would destroy the parasite.

To sum up I would say, the scutellista, if given a chance, will destroy the black scale. The sulphur mixture will destroy the red spider without injury to the parasite or the black scale. Fumigation as an effectual treatment for red scale will not require an annual application and will not materially interfere with the scutellista. While a single spraying with sulphur mixture, or single fumigation with cyanide, will be more expensive than one spraying with distillate, the former will not be more expensive when we consider that its effect is more lasting. A continued annual use of distillate will interfere with the work of the scutellista on the black scale and for this reason, if no other, should be discontinued.

THE SALE OF CULL ORANGES.

The action of the California Fruit Agency, representing the Fruit Exchange and the Citrus Union, is arranging to discontinue the sale of cull oranges in Southern California is to be cordially commended, says the Riverside Press. The average tourist who comes here complains that he has difficulty in finding any good oranges, and that the fruit served to him at the hotels and restaurants is always of an inferior quality, and it is a fact that this complaint is well grounded. The most of the oranges that are sold on the fruit stands and purchased by the hotels and eating houses are of a grade that is not sufficiently good to ship east at all. The result is that the average consumer right here where oranges are grown gets much poorer fruit than the consumer in the East. A great deal of ruit that is peddled about the country and sold at fruit stands and restaurants is picked up by peddlers from the dump, where it has been hauled out from the packing houses. It is absolutely unmarketable and unfit to eat. Yet this is the stuff that eastern people are regaled with, and it is no wonder that they are prejudiced against the country and are led to think that we are not growing anything but a poor quality of oranges.

The Vacaville Reporter notes the increase of orange tree planting in Solano county this season.

Mills & Masters

JAS. MILLS, Mgr. RIVERSIDE, CAL.

RIVERSIDE NURSERIES, Riverside, Cal. Fullerton, Cal., Oct. 24, 1903.

Dear Sirs—It is with no small degree of pride that I point to the orange orchard that I set out in June, 1902, with stock from your nurseries. I am not acquainted with any orchard of similar age that has done so well, and is today so promising. This certainly speaks in no uncertain language of the character of the stock coming from your nurseries. Very respectfully, CHARLES CHAPMAN.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

A DESIRABLE ALL ROUND GRAPE

Thompson's Seedless grape is having a boom in some of the fruit sections of the upper part of the State. This is one of the most prolific of our vines, an exceedingly heavy bearer, and has so far proven itself one of the most profitable fruits that can be grown. The fruit ripens early, is a favorite table grape, both on account of its flavor and its seedless qualities. It is a good drying grape, and as a raisin commands a good price. The origin of this grape is somewhat of a mystery. It is claimed that it was originally purchased from a firm in Rochester, N. Y., and found in a shipment of other vines among which it had got by accident. When the vines came into bearing, this one was found to possess superior qualities and it was desired to get its name. Application was therefore made to the firm from which the vines had been purchased, but they did not know it, and so it has gone by the name of Thompson's Seedless ever since, for want of a better. Whatever its origin or name, the grape is one of the best we have, the bunches are very large and the vine an enormous bearer, while the fruit is always in good demand for the table, and dried, is superior to the Zante currant or the Seedless Sultana in the estimation of many of our housewives. Yuba City and Marysville are the centers of the Thompson Seedless section, and here it has given such good results that a very large new acreage is set out each year, and this season there will be a heavier planting than ever before; in some cases deciduous fruit trees, apricots and peaches, are being removed to make room for this grape as giving promise of better returns.

* * *

THE COMING MONEY MAKER IN FRUIT.

The successful introduction and establishment in our State of the Blastophaga grossorum, or fig wasp, for which we are indebted to the persistent and untiring efforts of Geo. C. Roeding, of Fresno, has opened a new and what promises to be, a very profitable industry to our California horticulturists. Mr. Roeding has demonstarted what for years was a disputed fact, that by the aid of the fertilizing insect, genuine Smyrna figs can be produced in California, and he has further demonstrated that by care in packing and selecting, a brand of figs can be put upon the market from our State that is even far superior to that imported from the native home of this fruit. During the late fruit growers' convention at Fresno, Mr. Roeding had a lot of his pack of figs on exhibition, and they were sampled by all the leading fruit growers of the state, men eminently qualified to judge, and it was the unanimous sentiment that our California figs were far superior to any they had even eaten. This is true, and it is due largely to the care and cleanliness in packing. The Smyrna figs are handled in true Oriental fashion, regardless of consequences, and are packed in the dirtiest way by men who have no regard for cleanliness of person or surroundings, and oftentimes by the time they reach the consumer they are alive with insects. In our packing houses cleanliness is the first requirement, and every precaution is taken to see that the fruit is absolutely free from insect eggs. It is packed in the neatest and most attractive manner, and there is no good reason why there should not be a much larger demand for figs in the United States than ever, when we can produce so good an article and offer it in presentable shape. Mr. Roeding has taken the name of Calimyrna for his trademark and this is the mark of his particular pack. Under this he proposes to build up his name in the fig business, and he is in the right. There is, however, no limit to the production of the Smyrna fig in California, and now that our fruit men have been shown the way, there is every prospect that a very large new industry in the growing and marketing of this new fruit will grow up. In the Sacramento valley there are already some very large orchards of Smyrna figs, and the acreage will be increased year by year, until we shall no longer import figs from Smyrna, and will supply vastly more of this delicious edible from our State than has ever before been consumed.

SPRAY ON SUSPICION.

A London sweep, expatiating on his extraordinary personal cleanliness to the clergyman of his parish, said: "Vell, yer see, I allus makes it a rule to vash my face vonce aveek, vether it vants it or not." Perhaps the same rule would be a good one to apply to our orchards in regard to spraying, although with even less frequency than the hero of our story washed his face. Spraying is a good thing sometimes to do on suspicion. If your apricot trees were affected with shothole fungus last season, if your peach trees had curl leaf, if your pears were troubled with cracking and your apples with scab, you may be sure that the spores of all these diseases exist in abundance on the trees this season, and if not killed out in some way the disease is going to be worse than it was last year. Now all these diseases belong to the fungus group, and the same remedy is applicable to all, and it has got to be a preventive remedy, for when a curative one can be applied the disease will have run its course, all the damage will have been done, and the trees may as well be let alone for that season. So if your trees were troubled last year you will have reasonable grounds for suspicion that they will this, and it is well to act upon that suspicion and start in on them while the season permits. The two principal remedies used in these cases are the salt, sulphur and lime wash, which has been found effective as a fungicide as well as an insecticide, and the Bordeaux mixture, which is the standard fungicide, in use and recommended all over the United States. The latest formula for the Bordeaux mixture has been given in these columns recently and those who desire to refresh their memories in regard to it can find it there.

Redlands Nurseries

A complete line of DECIDUOUS TREES, consisting of Apricots—Royal, Blenheim, Newcastle's Early and Moorpark—and a full assortment of Peach, Plum, Prune, Pear, Nectarine, etc. In short, everything in the Deciduous line. We can offer the best CITRUS TREES to the planter that are on the market, free from scale and true to name, as we grow all our trees ourselves and you are not paying a middleman. When buying, buy of us and get good trees that will grow. Our stock of Deciduous Trees are as good as any and better than many and cheaper than all others. Write us for prices.

IRRIGATION OF DECIDUOUS TREES.

Editor Cultivator: Will you please state how soon after gathering the fruit from prunes, peaches, cherries and apricots, should irrigation begin and at what period should it cease, so as to allow the trees to become dormant and form fruit buds for the following season? Also, how much water should be given trees as winter irrigation on a soil of loamy, sandy nature, mixed in some places with clay and in a few places with adobe, yet having good under drainage.—Subscriber, Edenvale.

There is no straight rule for irrigating any of the above varieties, except as far as general principles go. It is usually advised that all irrigation cease after the pit hardens, but with some of the late varieties of peaches this is not practical unless the soil is very retentive of moisture and very deep. Even varieties that ripen in mid-season will be benefited by an irrigation when they are nearly grown, or within a month or so before they ripen, provided they are on a soil that cannot retan enough moisture from the rainfall or early irrigation, to properly mature the fruit. It is up to the man who owns and works his orchard to know his ground so well that he knows where frequent irrigations are necessary and where they are not. The trees in a full bearing orchard will show for themselves. In sections where the subsoil is streaked, the growth of the trees after they are old enough for the roots to penetrate to these subsoils, will show where the different characters of soils lie. It is not advisable to irrigate within a month of the time of ripening, especially with apricots and freestone peaches. The irrigations that follow the picking of the fruit will depend on the condition of the trees and this depends on the subsoil. We know of cherry orchards for instance, that receive no irrigation other than the natural rainfall and produce abundant crops of high grade cherries. The subsoil is rich and deep and holds the moisture. There are also cherry orchards that require frequent irrigations and there are soils that may give all the gradations between these extremes. Without the actual experience of several years it is impossible to give reliable advice on these matters. Trees should remain as thrifty after the fruit is off as they were before, and if the crop makes them look "tired" they should receive water as soon as the fruit is removed. If on the other hand they remain fresh and vigorous, we should consider an after irrigation useless. Fruit buds do not form during the winter, but while the trees are growing during the summer time. If the trees continue to make some growth at certain intervals during the summer and fall, the buds will mature properly. Strong vigorous buds are indicated by the swelling at their bases, increase in size, denoting increase in vigor.

On land that requires irrigation it is pretty safe to apply the water as soon as the fruit is off the trees. On land that has some clay or adobe, care should be taken when irrigating in the winter. If the soil becomes saturated and continues so in the late spring, the sap sometimes ferments and kills the tree. If water collected in augur holes that are two to three feet deep late in the spring, we should count any winter irrigation that we might have given a detriment. A few such holes in an orchard would reveal such conditions should they exist. Should the soil be mellow yet wet to three or four feet and without standing water, we should consider winter irrigation, had it been practiced, an advantage. The time of applying winter irrigation is immaterial. The climatic conditions control the blooming and other growths of the trees. Irrigation might cause a variation of a few days in these growths of the trees, but there would be no practical difference. The cherry ripens so much earlier than the other varieties of fruit named, that it may easily receive an extra irrigation or two after the crop is picked, but it is also very sensitive to an over dose of water, especially during the spring. Peach and plum trees on plum root will stand over-irrigation much better than when on peach root. The safest way to ascertain how much water should be applied is to make a few holes at different places in the orchard and observe how the water acts in the soil.

* * *

CASSAVA CUTTINGS.

Editor Cultivator: Will you please tell me through your paper where I may obtain roots or cuttings of cassava?—T. S. Reynolds, Hueneme.

By addressing the agricultural station at Fort Meyers, Florida, you will be able to get into communication with some reliable person who has them for sale. Great care is necessary in packing them. They should not be allowed to heat the least bit. It has been our experience that the light colored cuttings only will grow. They should be shipped in spagnum.

* * *

MILDEW ON GOOSEBERRY PLANTS.

Editor Cultivator: Will you please give a remedy for mildew on gooseberries if there is one, or will I have to grub them out. I have some fine bearing bushes, but when they get nearly ripe they become covered with mildew.—Subscriber, Waddington, Cal.

Apply with a spray pump just as the green leaves are unfolding, Bordeaux mixture or potassium sulphate solution. The first is made by dissolving four pounds of bluestone in 20 gallons of water and slacking four pounds of quick lime in 20 gallons of water and mixing the two. The potassium sulphate solution is made by dissolving one pound of the powder in 32 gallons of water. Drench the plants so that the liquid will run down onto the ground.

BURYING MANURE.

Does manure stay where you put it, asks a writer in Small Farmer, or does its beneficial effects rise and fall in the soil? That is a question, says the editor, that seems to call for a division of opinion. There are men who assert that manure sinks in the soil. That is, the leading rains wash it downward, and for this reason they claim it should be applied at or near the surface.

On the other hand it is asserted that its volatile and most valuable parts rise by means of fermentation, and that it is a good reason for burying deep.

As a rule manure stays just about where you put it. If plowed under in lumps, it has not the power to sink nor rise, nor can it in any way intermix itself. Thorough harrowing before turning the manure under, rewards in large crops.

Clay has great power to absorb the fertilizing portions of manure, consequently such soils as have a medium amount of clay or loam, generally absorb all the valuable parts of barnyard manure.

A writer of considerable note, about forty years ago, computed that forty loads of manure spread on an acre, while making a heavy coating, was only one load to four square rods, constituting a depth after being spread of about one-third of an inch. In a case like this, when plowed under the volatile parts have but one-third of an inch to pass before all are absorbed by the soil. This shows the great importance of thoroughly mixing the manure through all parts of the soil in order to obtain the full benefit."

Bertie—"Are we any kin to chickens?"

Gertie—"Of course not; we're people."

Bertie—"Well, Uncle Harry says papa was a mighty bad egg when he was young."

"ITS PENNY WISE"

Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it, when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 450 Santa Fe ave., Los Angeles.

Conducted by PROF. A. J. COOK, Claremont, Cal

A B C OF INSECTS.

Aculeatā—We now come to those insects that have their ovipositor developed into a sting. This carries often enough venom, so that it is quite a formidable organ of offense and defense. It will be remembered that the scorpion has a venomous sting, the centipede a poisonous bite, some of the bugs, the so-called kissing bugs, secrete poison and so are dreaded, as are a few spiders, while not a few flies can bite in a cruel fashion. When the wound of mosquito or gnat swells, it is supposed that it is not poison that effects so much as germs or bacteria that cause the severe irritation. A few spiders, while not a few flies poison about as does a nettle, by the irritating punctures that are made by the stiff spines that clothe their bodies. Aside from these no insects other than these aculeata can poison by bite or sting.

* * *

Cow-killers—There are from Kansas to California a family of insects called cow-killers, or Mutillidae. In general they remind us of ants. They are usually red, with black markings, or else grayish white. The ones that we see most are wingless. They have long hairs, and a very powerful sting. These are the female. The males look much the same, only they have wings and can not sting. They are solitary, that is they do not live in colonies as do the ants and social wasps and bees. They feed on insects and so may rightly be regarded as our friends. They even kill and eat honey bees. They breed in holes in the earth, and are rare in all sections of the country where they are found.

* * *

Ants—The familiar ants are also aculeata, though their sting is feeble and less dreaded than is their bite. They remind us of the bees in that they are in large colonies, and in these we find the winged queen, the winged drones and the wingless females, the ones we generally see, as they are very common and crawl or run to and fro over the ground. Besides these, we have the large headed soldiers. These are armed with strong jaws, and are abortive males, as the workers are abortive females. The queen always remains in the nest, which consists of extensive tunnels under ground. In midsummer the young males and queens develop and fly forth to mate, when the air will seem full of these mating ants. After the mating the workers conduct the young, now fertile queen to her new home, eat off her wings, and so she is now held a prisoner, I dare say a willing prisoner, for life. Her work henceforth is to lay eggs and nothing more. The males only do sex duty. The soldiers protect the colony. The food consists of seeds, insects, nectar and honey dew. Ants often come into our houses in a way to become very troublesome. It is found that a large string moistened or wet in a solution of corrosive sublimate will resist them if placed across the path of entrance. All insects have a great aversion to this poison. Let us not forget that it is a very virulent poison and be guarded if we have it about the house. It is wise to have a place in the house for poisons where they shall always be kept and where nothing else shall ever be put. Buhach or insect powder will also keep the ants away, but it must be applied often.

There are many strange things about ants. They make prisoners and keep as slaves other ants, they keep and guard plant lice in their nests, which serve them as a sort of "milch cow," as they feed on the honey dew that the aphids extrude. When we see ants on a tree running over the twigs and branches, we may be pretty sure that either aphids or scale insects are working on the same tree or plant, and are furnishing the ants with this nectar. Of course at times ants live in tunnels which they bore in the trees for a home, usually in partially decayed trees, and then they crawl down the tree as they go for their food.

The honey ant of the western parks is peculiar in another respect; some of these develop an immense stomach and strong legs and always hang to the rock walls of their homes, and are vital honey jars. The other ants gather nectar and hand it over to be stored by these ants with the big stomachs. The Indians use these at their banquets for dessert. They eat them much as we do grapes in hand.

For the most part ants do little harm. They annoy us in the house and on the lawn. In the latter case we can kill them by use of bisulphide of carbon. In Florida a species of ants kills bees, and in some places ants are condemned for eating the foliage of trees and plants.

* * *

Wasps—There are several families of wasps. Most are solitary, like the mud wasps, though one or two familes are social and make for a home large paper nests out of wood pulp. Thus the ants were first to make wood paper. These yellow-jacket wasps are very predacious and do us much good. Other wasps nest in the earth, some in hollow stems, while many construct mud cells in which the young are reared. The yellow jackets remind us much of bees in their way of life, only they feed their larvae digested insects, instead of digested pollen. All the ants are very helpful to the farmer, as they rid him of hosts of injurious insects. Wasps are dreaded far more than they need be. If undisturbed, they are usually peaceful. I have had a large wasp nest right near my porch. I often went close to the wasps and watched their maneuvers, and as I never molested them they were always amiable to me. They only resent intrusion and harm, and they are well endowed to do that effectually.

* * *

THE PEPPER TREE.

Mr. Titus, Pomona, asks for the name and for my opinion of the pepper tree for street planting. The scientific name of this tree is Schinus Molle. It is a native of Mexico, and South America. It belongs to the same family as the poison sumac, the poison ivy and our own poison oak. I know a lady that contends that this pepper is poisonous to her. I think that this is not generally true, or we should hear more of it, as this tree is used much for decoration.

It seems to me that this tree is worthy of all praise as a street tree. It is exceedingly beautiful, will grow fairly well after it is once started with no irrigation, and is a choice tree to furnish twigs and branches for decoration. The ample compound leaves are replete with grace and beauty, the flowers are attractive, and the fruit is a drupe and the clusters of red on the pistillate trees are exquisite as they hang against the foliage. As all must have observed, the tree is dioecious. The staminate or male tree is not so attractive as is the pistillate tree when pendant with its lovely red fruit clusters, yet it forms a pleasing variety and both trees are very attractive. The only objection that I know to this beautiful tree as a roadside tree, is that it attracts the black scale. This is true, though it is not a favorite with this pest. We shall hope that with the presence of the Scutellista among us, this objection will lose its weight. Indeed it is good to have these trees now, as we can liberate the Scutellista on the peppers and spray our citrus trees, if they need it and not harm the little chalcids. So I am free to recommend the pepper as one of our most desirable street shade trees.

* * *

THE ORANGE TOTRICID.

Supervisor Davis and several others at the Glendora Institute remarked on the abundance this year of the little caterpillar that works in the orange. From remarks made it must be much more in evidence than is its wont. This is a common experience with all our insect pests. They will come in greater abundance occasional years. I presume that these will be scarce again next year. They have been in the orchards for many years and have never become abundant. Circumstances do not seem to favor their rapid increase. Though they are closely related to the codling moth, yet they feed for the most part on the foliage and so are much more exposed than are the caterpillars of the codling moth. If they become too numerous it may be well to gather the affected fruit and destroy it and them. The early coloring of the injured fruit makes this practicable.

* * *

THE LINNETS.

These little pests are becoming very annoying. They are great destroyers. They commence at one end of our apricot tree and take every bud on the twig. I like their merry chirp and enjoy to see them so free and so happy, yet I would like a little fruit. One is tempted to get the shot gun and see if they can be frightened away. They are certainly very provoking little thieves.

Coast News and Notes

BY R. A. DAGUE, ROOM 416, HEARST BUILDING, SAN FRANCISCO

AGRICULTURE.

The acreage planted to melons in Cochella valley will be greatly increased this season.

Bolsa farmers who last year planted 2000 acres of sugar beets, have so far refused to enter into a contract this season.

The Ukiah Times says hay and grain prospects in Mendocino county never looked better than at the present time.

The Orange county peanut growers have generally decided to stop raising the nuts and plant their lands to more profitable crops.

Florin, near Sacramento, shipped last season 160,000 cases of 15 pounds each of strawberries, and 200 car loads of table grapes.

The dry weather will cut the celery crop of Southern California short over 100 cars. Most of the season's output has been marketed.

W. E. Meek of Haywards, the noted fruit and vegetable grower, has purchased 160 acres near Coachella, which he will put out in asparagus.

The growers of tomatoes and other vegetables in the vicinity of Haywards have organized to regulate the marketing of their crops next season.

Anspacker Brothers of Livermore are baling 1000 tons of hay for the Philippines. They do the work with an Ajax press operated by electricity.

A farmers' institute is in session at Lindsay. The program includes papers on insects, irrigation, household, dairying, pruning and fertilization.

The Agricultural Department of the State University will test the efficiency of the new French machine for extracting oil from olives by centrifugal force.

The farmers of the Sacramento valley are seeding an unusually large acreage this winter. More grapes of the Tokay variety than usual are being planted, also.

The canteloupe growers of Cochella have transferred their contract for shipping melons from Lyons & Coggins to E. R. Nichols & Co. of Chicago.

A special meeting of the California Raisin Growers met in Fresno the 13th. A motion was made by Theodore Kearney to cut prices but it was voted down.

Prof. Dryden of the Utah State Agricultural College has located his family at Fullerton for the winter. He has the most extensive and expensive experimental station in the United States.

The Phenominal berry, one of Luther Burbanks' latest productions, described as larger than the largest berry ever before grown is being extensively cultivated in the Imperial country.

The California Vegetable Union is reported to have shipped since November 1st over 10,000 crates of tomatoes, to all points in the East. This is the heaviest shipment ever made in one season.

The Imperial region is counting on furnishing a great amount of wheat and barley hay to Southern California, provided we do not get rain enough to perfect a crop throughout this part of the state.

The hop growers of Oregon are so well pleased with the results of the past two years that the hop acreage will be increased 10 per cent this year. Some contracts have already been entered into at 15 cents.

Ex-Senator Darggie of Oakland is installing a $10,000 pumping plant on his ranch in Santa Maria valley with which he proposes to irrigate fifteen hundred acres of that choice valley to be planted to sugar beets.

The hop crop of the State of Washington will amount to 40,000 bales this season, an increase of 8000 bales over last year. This means a revenue of from $250,000 to $300,000 more than was received for the previous crop.

Yakima county, Washington, raised more hops this season than ever before, but they were very poor in quality, because of the ravages of the hop louse, the damage amounting, it is estimated, to upwards of $150,000 in that district.

Last year the wheat crop of Kansas amounted to over 94,000,000 bushels, valued at $52,426,000. Corn led in value, it being worth over $57,000,000. The total value of farm products of the State as given by Sec. Coburn for 1903 was $223,984,498.

The Tahama New Era reports the bringing into that office of two bunches of young grain—one of barley and the other of oats—which were fully headed out. The barley stalks were about three feet high and the oats five feet. They were both of volunteer growth this season.

The Stockton Independent says that the Stockton winery each year makes heavy shipments of wine to the East, both by rail and water, but as a rule the bulk of the wine is ordered shipped on sailing vessels, as it is claimed that wine ages very fast on board a deep-sea vessel.

The longest run a California beet sugar factory ever had was finished on December 13th, when the Union Sugar Co.'s factory at Betteravia closed. The run lasted 150 days, and during that time 120,000,000 pounds of beets were worked, and 160,000 sacks of first-class granulated sugar was made. The largest amount of beets sliced in twenty-four hours was 534 tons.—Chino Champion.

The Chronicle says: Director A. V. Taylor of the Raisin Association is reported as saying that there is no reason for the growers to feel alarmed, despite the fact that this year there was harvested one of the largest raisin crops in the history of the industry—about 5800 cars, 4800 of which are inside the association and 1000 outside of it. Of this amount the association had sold, up to December 1st, 2200 cars, while probably 900 cars of raisins outside of the association had been sold. This leaves but 100 cars not sold, outside of the association, while the association has about 2600 cars on hand.

HORTICULTURE.

The fruit growers of Sutter county are preparing to begin spraying.

Over 350 car loads of fine oranges have been shipped from Palermo this season.

The farmers of Sutter county are this winter planting an unusual number of almond trees.

And now it transpires that the apple crop of Washington is only about half what it was in 1902.

State Horticulturalist A. Van Hoedesbeke reports that 150,000 fruit trees were planted in Washington last fall.

Alexander Craw, quarantine officer, has received encouraging information as to the work done by the scutellista in Santa Barbara county.

Alex Craw, Deputy State Horticultural Commissioner, inspected the nurseries of Sutter county last week to ascertain if they were free from injurious insects and diseases.

Wm. Barry, Horticultural Commissioner of Alameda county, in his annual report for 1903, says that the value of the fruit crop in Washington and Pleasanton townships was $94,228.

The Riverside Enterprise speaks of the receipt by the Chamber of Commerce of some very fine apples grown on an elevation of 5000 feet. The owner built a concrete house for his apples in the side of the mountain, which preserves his fruit better than a cold storage plant.

LOS ANGELES, CAL.

Coast News and Notes

CONTINUED

The California Horticultural Commission is preparing a cabinet containing noxious insects that attack our fruit trees, with their parasitic enemies, to be put on exhibition at the St. Louis Fair.

The board of supervisors of Fresno county has decided to discontinue the services of the three horticultural commissioners after January 31, of this year. No reason is assigned for this action.

The new packing house of the Lemon Exchange at Upland is about completed. The floor space will be 11,250 square feet with a basement 50x75 feet. When finished the building will be ample for the lemon growers of Upland.

W. H. Volck, of the State University, is making an examination through Southern California orange groves as to the cause and extent of the spot which causes decay in oranges. While he does not state cause of the disease he is satisfied it is not caused by insects.

P. J. Dreher of Pomona has made an investigation to ascertain the cost of raising oranges. In a total of 2828 acres, valued at $1,970,905, the cost of fertilizers and labor was $200,891, an average of $691.50 an acre, which includes land, water, reservoirs, pipe lines and equipments. On this basis he estimates the average cost of oranges per box at $1.19 delivered at the car.

Henry C. Allen, owner of Allendale ranch near Pasadena has placed on exhibition in Pasadena a collection of citrus fruit which includes the best varieties grown. The idea is to influence the authorities in placing a government experimental station at Pasadena, for it is argued that every kind of tropical and semi-tropical fruit can be grown in this part of the state.

At a mass meeting held at San Jose on Saturday, the fruit growers of the Santa Clara valley pledged themselves not to make any sales of their prunes without first consulting the Executive Committee, appointed at a previous meeting. Arrangements were made whereby any who must sell soon may sell at market prices to the committee, thus strengthening the market instead of depressing it.

The California Fruit Distributors have the following officers for 1904: President, Frank H. Buck; Vice-President, W. E. Gerber; Secretary and Manager, Alden Anderson; directors, H. A. Fairbanks, C. M. Hartley, T. M. B. McKevit, G. D. Kellogg, A. R. Sprague, C. B. Bills, A. H. Schnable and A. C. Short. Lieut. Governor Anderson will remain as heretofore, manager of the Association.

LIVE STOCK.

The Palo Alto creamery has been sold to A. H. Humphreys.

Kings county creamery is turning out more butter at this time than last year.

J. C. Holliday has been elected manager of the Arena creamery, Mendocino county.

A party of capitalists is perfecting plans to establish an extensive dairy in Kern county.

J. C. Young of Taylorville is about putting in a co-operative creamery in Indian Valley, Plumas county.

The Sonoma County Co-operative Poultry Association is preparing to do business on a very extensive scale.

The value of the live stock now in California is estimated at $73,000,000—one-third of that amount being cattle.

Eastern dairymen are looking to California. The point of view seems to be Mendocino and Humboldt counties where feed is plenty.

The citizens of Ceres, Stanislaus county, are preparing to build a co-operative creamery to take the place of the one destroyed by fire.

George Y. Coutts writes the Cultivator that he has sold H. H. Needle of El Cajon, a fine bull calf, and to E. M. Wheeler of Tustin, a heifer calf sired by Pacific Golden Lad.

The Jackson Granger Co., with $50,000 capital, is proposing to establish one of the best dairy plants in California at Decoto, Alameda county.

The ranges in northern Santa Barbara county which have been overstocked with cattle are experiencing trouble. Cattle are dying for want of fodder.

G. G. Pliter of Imperial will shortly bring to that valley 3000 head of grade sheep from Texas. This will be an additional industry for that section.

Ex-Senator F. I. Wolcoot, of Denver, Colorado, has just closed a deal in Texas for 500,000 acres of land in the Panuco river country, on the coast of the gulf, which will at once be stocked with cattle.

The Chedley Cattle Company of Sturgis, S. D., which was organized about twenty years ago, with a capital of $500,000, has sold its cattle to private parties and will retire from business. The original incorporators are all dead.

In the province of Hanover, Germany, there are 95 associations which handle annually over $20,000 worth of eggs. The eggs are usually bought by weight and the price under their control has advanced about one fourth of a cent per egg.

The fright among stockmen over the drought, and the report that cattle were dying as a result seems to have been premature. Some stock have died of dry murrain but none have starved as yet. We glean from the Porterville Enterprise.

MISCELLANEOUS.

Imperial is moving for incorporation.

A new two-story hotel is being built at Imperial.

The Tule river irrigation indebtedness has been wiped out.

At Lompoc the oil industry is more prosperous this year than ever before.

The new milk condensing factory at Tempe, Arizona, is completed and operations have begun.

The Board of Trade of Redlands spent $1293.69 last year in advertising that beautiful and energetic town.

The Board of Supervisors of Tulare county has established the tax on slot machines, also the county tax, etc., paid by merchants.

The Woman's Improvement Club of Healdsburg have planned to plant trees along the county road for a distance of four miles.

G. A. Barry of Santa Paula has been elected a delegate to the Camino Real convention which meets in Los Angeles January 30.

Representative Daniels has introduced in Congress a bill for $250,000 to purchase a site and erect thereon a Federal building in San Diego.

The Mt. Whitney Power Company of Tulare is putting in a large power house on the Kaweah river to assist in irrigating the bottom country.

The Napa Woolen Mills have been sold to J. D. Ladley and F. Carter of Portland, Oregon, who will re-equip them with new and modern machinery.

Japan imports annually condensed milk to the value of from $325,000 to $350,000 and but an insignificant amount goes from California. Here is an industry worth looking after.

California rural routes have been established during the week as follows, service to commence February 15: Hynes, Los Angeles county, with one; Nestor, San Diego county, with one.

FREE BOOK

Every woman will be interested in a neat little book published by the California Specialty Co., Frost Building, Los Angeles, Cal. This book gives complete information about toilet articles, etc.; tells all about prices and gives much information of value to all ladies. Readers of this paper can have a copy by sending in their name now.

2,000 ENGLISH WALNUT TREES

Raised from selected seed. They are very thrifty and range from three to eight feet in height and are free from any blight. They have been so declared by Horticultural Commissioner Jeffrey.

FLORICULTURE AND GARDENING

[BY ERNEST BRAUNTON, GLENDALE, CAL.

PARKS OF NEW YORK

New York City has over eighty parks ranging in size from less than an acre to over seventeen hundred acres in extent. It has two of greater extent than its famous Central park. Those of five hundred or more acres are: Pelham Bay park, 1,756 acres; Van Cortlandt park, 1,132 acres; Central park, 843 acres; Bronx park, 660 acres; Prospect park, (Brooklyn) 516 acres. Numerous other smaller parks make up a total of about 7,000 acres. California has two city parks larger than any in New York.

* * *

CATALPAS.

Ed. Cultivator: Please inform me as to cultivation of catalpa trees in Southern California. Where can trees or seeds be obtained.—D. B. Richards, San Marcos, Cal.

We can give you all the information needed about the commercial growing of the trees in the states of the Middle West, but do not know of them being grown here except as ornaments. We would be pleased to hear from any one growing them on a large scale For trees or seeds write to any Fresno or San Francisco nurseryman advertising in our columns.

* * *

OPIUM POPPY.

Ed. Cultivator: Please answer the following questions through the Cultivator: 1st. What variety of poppy produces opium and how is the opium obtained? 2nd. How should I plant cultivate and harvest peanuts, to be successful? 3rd. What is the best eucalypt for high, dry land; also the best one for border of gulch, where there is more or less moisture?—Subscriber, Los Gatos, Cal.

The opium poppy is the common, large-flowering annual with glaucous—blue foliage (Papaver somniferum.)

Opium is made from a milky juice which exudes from cuts or slits made in the sides of the green (or immature) seed capsules. You can easily obtain this fluid by trying the above experiment. Question two will be answered by Mr. Mills and number three by Prof. McClatchie, to whom they have beeen sent.

* * *

TRITONAS.

These popular plants, known in general as montbretias, and closely allied to gladiolus, are usually seen only in one color, an orange-red. Perhaps by reason of one shade only being common, they are not more popular, but as they are positively among the easiest of plants to grow, those having little in their grounds in the way of ornamentals, should procure a few bulbs. They increase rapidly and make a splending border, or low background, during a large portion of the year. During the past few years no less than eight or ten distinct shades have been created and with all of them growing together they make a charming collection. Though greedy for food and water, they will flower very well if much neglected. To get best results, the bulbs should be thinned out occasionally; the flowers being much smaller in thick plantations.

SUPPOSED HARDY PALMS.

The writer is often asked by palm fanciers if there are not numbers of rare or little known palms which might be grown in sheltered spots in comparatively frostless districts in this state. Most certainly there is. Acanthoriza Chuco and A. aculeata should thrive if favorably situated. Some species of Bactris are quite hardy and Bacularia monostachya from temperate Australia would certainly thrive here. Balaka Seemanni from Fiji would grow if heavily shaded. A goodly number of species of Cocos, that are rare, are growing well in the open near Santa Barbara. If proper shade, protection from frost by overhanging foliage, and sufficient humidity in the atmosphere were present, our list of out-door palms could be more than doubled.

* * *

THE COQUITO PALM.

Exaggerated accounts of the value of this palm have lately appeared in a Los Angeles daily paper, and though the statement that the one mentioned was worth five hundred dollars is "way off," it is, nevertheless, a valuable palm for the California garden. It is native to Chile and known to botanists as Jubaea spectabilis (after Juba, king of Numidia). It is one of the hardiest of all our palms and a fast grower, if well supplied with water. Small plants may be obtained in the local market for one or two dollars and upward, and of late years have been planted by hundreds. There is much of interest about the palm in its native habitat. There it is also known as the wine palm.

"A full grown trunk yields about ninety gallons of sugary sap, which is boiled by the Chileans and called palm honey. There is some danger of the species being exterminated from this cause alone." In general appearance it greatly resembles the ornamental date (Phoenix Canariensis) so common throughout California. One marked and interesting difference is in the pinnae or leaflets. In Phoenix these are channelled on the upper side while in the wine palm they are channelled below. Botanically this palm is closely allied to the cocoanut of commerce and the seeds look much like small cocoanuts.

The newspaper article referred to also contained an account of Areca rubra growing here. This palm, properly Acanthophoenix rubra (from meaning "spiny phoenix,) is not at all suited to our climate and will not thrive anywhere in this State. The statement as to its rarity, "one of five in the United States," is a gross misstatement. It can be bought in the eastern nurseries.

The honey men say that there is no foundation for the prevailing belief that artificial honey comb can be manufactured. The United States Government offers $1000 for any tangible evidence that the sealed product of the hive can be successfully imitated.

MAYWOOD COLONY NURSERY

W. HERBERT SAMSON, PROP.

We have for sale all leading varieties of Deciduous Fruit Trees

OUR SPECIALTY:

Lob Ingir or Genuine Smyrna Fig of Commerce

A WORD ABOUT FIGS: We sell the genuine Fig of Commerce. Our cuttings came from bearing trees in the orchard of the Stanford estate, near Vina, and the fruit from these trees, after being examined by the best fig experts of the State, is pronounced the genuine Fig of Commerce, the Lob Ingir. Dr. Eisen says this and no other variety should be known as Smyrna, if the name Smyrna is to be used at all. We can refer prospective purchasers to the Supt. of the Stanford ranch, at Vina, for a verification of this statement. As to my own reliability, I can refer parties to any of the leading merchants of Corning, and to the Bank of Tehama County, and the Herbert Kraft Co. Bank, at Red Bluff, Cal. No one in the Unites States originated the Commercial Smyrna Fig. It is a variety which has been grown in Asia Minor for thousands of years. Parties may originate a fancy name and copyright it, but this does not make the fig they sell under a copyrighted name, any better. The fig we sell does not require a high sounding name to make it appear as the only commercial fig. All that we claim for our fig is that it is known as the Lob Ingir, the cuttings of which came originally from the famous orchards of Smyrna, Asia Minor, and is of the variety so largely imported into the United States in the dried state. We are not charging you for a private copyrighted name, but we sell you good 2 to 4 foot trees of the Genuine Smyrna Fig of Commerce at $150 per M. To fully demonstrate the methods used by some nurserymen in giving old varieties of fruit trees a new name and thereby make it appear that they have the only genuine article, we will say, how ridiculous it would be if we copyrighted a name like "Muro" and sold the old variety of Muir Peach under this name. Do not be misled by copyrighted names. We have the genuine Smyrna Fig of Commerce and if you want to confirm our statement, we do not hesitate to refer you to the above named parties. We can supply prospective planters a small sample of our dried figs for comparison with the so-called copyrighted figs. We also have for sale all varieties of Capri Fig trees, and all of our customers will be supplied at the proper time with a colony of Fig Wasps, free of cost. Address

W. Herbert Samson, Prop., Corning, Tehama Co., Cal.

C. H. SESSIONS, ASSOCIATE EDITOR

WHY DAIRYING IS PROFITABLE.

H. E. Wright, Dairy Commissioner of Iowa, is an enthusiastic believer in dairying. He says it is the best business the farmer can follow, because it can be made to grow so rapidly, and because it takes nothing from the soil.

It adds to the soil, which betters the farm. Continuing, he adds, "all the products of the farm come primarily from the soil, or the air. If a man sells those products the substance of which comes from the soil, he is selling his farm piece meal. This is exactly what the grain seller does. The stock man and the stock feeder do the same thing to a much less degree. A dairyman sells absolutely nothing from his farm which would be of any value if left in the soil. The carbon, hydrogen and oxygen which make up butter come altogether from the atmosphere, and the man who carries on dairying sells from his farm a manufactured product and has left in his soil all the fertility that it originally contained.

Dairying is profitable because the dairyman has little or nothing invested. Iowa is a hog and cattle state. We must raise cattle, whether we wish to do so or not, and so we may say that the farmer keeps the cow for the purpose of producing the calf; and hence, the cow, in a sense, is not a part of his investment in the dairy business. All that is invested is the small amount of feed which she eats in a month or six weeks, at the end of which time he gets his return from the creamery. On the other hand, the man who raises and fats a carload of steers, or who raises a drove of hogs invests more and more in them every day for a year or two years or longer. His investment is subject to the change of prices, the disease peculiar to the animals, and other disasters. The dairyman has little invested; he has an almost immediate return from his feeds and there is little or no probability of loss in the business.

Dairying is profitable because it enables the farmer to get two returns from his cows instead of one. The farmer expects two returns every year from every kind of live stock usually kept on Iowa farms except cows. A man could not afford to keep sheep in Iowa if he did not get a crop of wool and a crop of lambs each year. A farmer could not afford to keep a mare a whole year for the single purpose of raising a colt; he makes her work for her board. We could not even afford to raise hogs in Iowa if they produced themselves only in the ratio of one to one, as cattle do, and yet there are hundreds of farmers in this state who are attempting the impossible task of getting rich from the profit arising from keeping a cow a whole year for the single purpose of producing a calf. The dairy business enables the farmer to raise just as good calves, and also to get $25 to $50 worth of butter from the cow each year."

Texas is not feeding nor raising nearly so many cattle as in the past. In fact the shortage is very marked.

THE DUAL PURPOSE COW.

The dual purpose cow is just now attracting more than usual interest among stockmen and dairymen. The idea is becoming popular at least, but whether practical or not remains to be developed. Below will be read the respective views of eminent authorities on this subject.

* * *

Until quite recently stockmen hadn't much idea that the Polled Angus cow is worth much except for beef, but a dairyman in Illinois has been keeping a record of the tests three cows make and in a letter to the Dairyman says:

"It gives us pleasure to report to you the result of a test made at our Harvard Factory, of your dairy of registered and high grade Polled Angus cows. The samples submitted by your foreman, Mr. Esmond, tested out very clear, and the samples from the four cows submitted for test on Nov. 22nd averaged 5.85% butter fat, and the samples tested on the 29th of the same month averaged 5.32%. The test made from the milk of your entire herd of grade Angus cows has averaged 4% to 4.50% butter fat for the entire season, which is one of the highest, if not the highest test, of any dairy coming to this factory.

Thanking you for your many kind favors of the past, and soliciting a continuance for the future, we are, yours very truly.—The Oatman Condensed Milk Co.

From my experience, says the correspondent, with these cows for a number of years, and from this and other reports regarding the quality of their milk, I am satisfied that well selected Angus cows are valuable for dairy purposes as well as for beef, and the quantity of milk will compare favorably with the average herd of grade dairy cows.

This fact and the other fact, that they give milk a longer season than others, are both much in their favor."

* * *

Though many attempts have been made to develop a breed of cattle profitable for both beef and milk, success in that direction has not yet been reached, and it seems more than probable that such a breed will never be secured. It is the natural tendency of every cow to use her surplus food either in growth and the accumulation of fat, or in the production of milk. Either of these tendencies may be greatly strengthened by intelligent breeding and selection, but no breed has ever been developed which excels in both beef and butter-making qualities, and improvement in either direction has usually been accompanied by a corresponding loss in the other. It is true that there are some breeds which make animals of fair size and which are also fair dairy animals, but they are only fair as either. The best beef animals and the best milking animals have never been found in the same individuals or even in the same breed, and the cattle raiser who attempts to raise beef for a living and at the same time to make money by using his cows in a dairy, is almost sure to find one branch of his business unprofitable. A profitable beef animal is one thing, while a profitable dairy cow is something quite different. The man who expects to make his living from a dairy should select the breed which will give him the greatest amount of butter and milk from the smallest number of animals at the least cost.—S. M. Tracy, in Creamery Patrons' Handbook.

HOW TO DRESS CALVES.

Calves from 3 to 6 weeks old, and weighing about 100 pounds, or say from 80 to 120 pounds, are the most desirable weights for shipment. The head should be cut out, so as to leave the hide of the head on the skin. The legs should be cut off at the knee joint. The entrails should all be removed, excepting the kidneys; the liver, lights, and heart should be taken out. Cut the carcass open from the neck through the entire length—from head to bumgut. If this is done they are not so apt to sour and spoil during hot weather. Many a fine carcass has spoiled in hot weather because of it not being cut open. Don't' wash the carcass out with water, but wipe out with a dry cloth. Don't ship until the animal heat is entirely out of the body, and never tie the carcass up in a bag, as this keeps the air from circulating and makes the meat more liable to become tainted.

Mark for shipment by fastening a shipping tag to the hind leg. Calves under 50 pounds should not be shiped, and are liable to be condemned by the health officers as being unfit for food. Merchants, too, are liable to be fined if found selling these slunks, for violation of the law. Heavy calves, such as have been fed on buttermilk, never sell well in our market—they are neither veal nor beef.—Chicago Trade Bulletin.

VALUE OF ANGORA GOAT.

A subscriber writes to ask about the Angora goat, as to its value and feeding qualities. We have had but little experience with goats but what we have had, have found them to be exceedingly profitable stock to keep. We quote here from an authority on this subject, which answers the questions propounded by our subscriber.

"Goats are browsers by nature, and there is no vegetable they will eat in preference to leaves and twigs of bushes. They are omnivorous eaters and seem particular to avoid that character of vegetation which other kinds of live stock prefer. Every leaf and every twig within their reach is greedily eaten, even to most of the bushes and weeds that are considered poisonous to other ruminants, while remarkably few weeds are passed by. They will desert the finest clover and blue grass for such an outlay.

The inherent tendency to climb leads them to hillsides and rocky cliffs, and they prefer such situations to any of a level character. Here nature meets their necessities by dwarfing the bushes so they may be browsed easily. The soil is quickly drained in the event of rain, for they do not like wet land; and the stones serve to keep the feet trimmed properly by the wearing process. This is the situation that the goats would choose, but the farmer might choose to turn them into a dense mass of brush and weeds anywhere, and they will convert it into a beautiful pasture. After the removal of trees in clearing land the persistent growth of shrubbery becomes a problem not solvable by the brush-hook or the ax—but the goat.

Besides their value for subduing brush, the goats are of value for their mohair and meat. They thus become one of the farmer's important tools.

Pasturing—Much better growth is made and the quality of the fleece improved where browsing supplements pasturing. The flavor is imparted by the browse, and is absent in the mutton made from grass or grain. The mutton should have the flavor of venison.

So far as the goats themselves are concerned, they may be kept in the pasture where there are sheep, cattle and horses. Their presence is in no way obnoxious to these animals. A few of them in a flock of sheep are a protection against dogs. However, it is best for the goats that they are kept from pasture with horses, as the latter will chase them, especially the kids. Hogs are liable to eat the kids.

Number of Goats to an Acre—One acre of good brush will furnish twelve goats all they want for one summer. We would regard this as heavy grazing, but if you want goats to clean up brush, you must put on plenty of them, from six to twelve per acre, according to the quantity of brush available.

DAIRY EDUCATION PAID.

Dairy Commissioner McConnel of the state of Minnesota make the statement drawn from careful investigation that the butter production of that State has increased in the past twelve years more than 100 per cent per cow. This would have never happened, says Hoard's Dairyman, without the constant agitation of the minds of the Minnesota farmers on this dairy subject.

TO BREAK THE TRUST.

The National Live Stock Association which concluded its convention at Portland last week, resolved to incorporate a company of live-stock men for the purpose of establishing independent packing-houses in the stock centers of the country, to compete with the packers' combine and restore prices on live stock, was the all-absorbing topic of discussion in the national live-stock convention today. By unanimous vote the convention indorsed a resolution favoring the incorporation of such a company and the establishment of the independent houses. Steps will now be taken to raise stock subscriptions to the amount of $5,000,000 for the purpose of capitalizing the corporation and placing it upon a financial footing.

It was an undisputed fact that the decline in the value of beef animals during the past eighteen months amounts to more that $3 per hundred; hogs, an average of $5 per animal, and sheep from 75 cents to $1.00 per head. Consumers, however, are paying the same price for their meats. As the demand for meat products is as great as ever, and there has been no material increase in the number of head of livestoc.., these conditions are uncalled for, and the only apparent reason is the unjust manipulation of prices at market centers, assisted by the lack of knowledge on the part of producers as to the visible supply.

Much time was devoted to the consideration of live-stock conditions in the various states. The burden of the report of each speaker was that while conditions of the market and range are not what they would like to have them, yet the live-stock industry is in good condition. Indications point to improvement in the future.

The other principal topic discussed was the policy which has been adopted by the Interior Department regarding forest reserves, particularly to the segregation of vast areas of grazing and agricultural lands as a portion of these reserves, and the issue of orders excluding livestock from grazing thereon. On this subject opinions were very pronounced and the convention was emphatic in its objections to the propositon to do away with the public range.

The action of the convention will probably have little weight with the Secretary of the Interior, who is backed by the President in his effort to compel compliance with the law on the part of all stockman now appropriating the public domain.

PROFITABLE WEED DESTROYERS

Prof. Kennedy of the Iowa experiment station says there are 600 kinds of weeds and grasses growing in the agricultural states, and of these sheep eat 550, horses eat eighty-two, and cattle eat fifty-six. He says sheep relish most weeds and do well on them; therefore every farm of a quarter section should have a flock of at least twenty-five sheep to help keep down the weeds, and that small flocks pay their way on most farms in this manner.

The cattle owners of Arizona, which Judge E. R. Munk and J. J. Vosburg, both of this city, belong to, have organized an association looking to the better protection of their interests in the territory.

A pig's tail is said to indicate unerringly the condition of the animal. If it hangs loose, it shows that the pig is not well and that its food should be changed; if it is coiled tightly, the pig is healthy and happy. Have you ever noticed this?

One advantage in keeping goats on the farm is that wherever they are kept the farm presents a neater and cleaner appearance. Goats rightly managed can be made to aid the farmer materially in ridding the land of noxious weeds.

LARGE OR SMALL DAIRY COW?

The large dairy cow is now the subject of much discussion in the butter making sections of the country. The reasons given favoring the large cow over the small one are many. They may not apply as well to California conditions as to other sections, and yet we are told that many dairyman in this State are drifting into the larger type of butter making cows. The article published on this subject this week will be of interest. It is founded on the experiments made at the Wisconsin station.

* * *

No act of congress has been of greater advantage to the farmer than the act establishing and aiding the State experiment stations; and no special work done by these stations has been of greater importance than that done in the interest of the dairy farmer. It is less costly to learn at another's expense than at one's own; and by giving heed to the disinterested, nonpartisan work done by the stations, the dairy farmer may save himself much bitter disappointment, and not be misled by following the false teachings of certain dairy writers and breed partisans. As its most valuable work in this line, the Wisconsin experiment station has recently issued bulletin No. 102, entitled "Studies in Milk Production." The present Wisconsin experiment station herd was established in 1898, and the bulletin covers the work of this herd for a period of four and one half years.

In order to make comparisons of results on a basis of type, the herd was divided into three classes—the small dairy, the large dairy and the dual purpose type. The men making this division were Messrs. F. H. Scribner, breeder of Jerseys; Charles L. Hill, breeder of Guernseys; George McKerrow, breeder of Shorthorns, and W. B. Richards, assistant in dairy husbandry at the station.

Pasture was figured at $1.50 per month, and other feeds at average Wisconsin market prices; while the butter was figured at 20 cents per pound and the skim milk at 15 cents per 100 pounds. The butter was computed on the basis of 85.7 per cent of one pound of butter fat in the milk equivalent to one pound of finished butter—usually known as adding one-sixth to the butter fat, and the standard now used by the Holestein-Friesian and Guernsey associations in their official records made under the supervision of the experiment stations.

The Large Type Preferred.—The conclusions reached, as a result of the most painstaking work through a period of almost five years, in which all the food given each animal was weighed, and each treated as though she alone were on test, confirm my teachings of twenty years past, that the largest type of dairy cow is more profitable for the dairy farmer. Space will not permit me to give as much as I would like; but, as conclusively in favor of the large dairy type, of which the Holstein-Friesian is the best exponent, I quote the following:

"From the data presented it will be seen that, everything considered, cows in group B, representing the large dairy type, are clearly in the lead for economic production of milk and butter fat. The results of over four years' work with cows of the extreme dairy type, represented in group A, not only failed to establish the claims for the superiority of cows of this type over a much larger and apparently stronger dairy type, but clearly showed that they are not as large producers, nor as profitable dairy animals, as the latter.

"That the extreme dairy type has been popular, at least in this State, is evinced, among other reasons, by the fact that three of the cows selected for the university herd at our solicitation by prominent dairymen in our state were fair representatives of this type of cows, and are included in group A. Our investigations have been conducted under the most favorable conditions possible for this type of cows; the stable in which they have been kept is considered a model one, as regards cleanliness, light, ventilation, and general comfort of the animals, and water is provided for them in the stalls so that they are not exposed to inclement weather at any time.

They are given the best care and attention at all times, being fed liberally, kept during the hot summer months in the cool, darkened barn, protected from sun and flies, and are fed various green feeds and grain in summer, as well as protected from cold in winter."

"In view of the ever increasing demands on the part of dairymen for cows that will have endurance and ability to withstand diseases, as well as great productive capacities, we do not hesitate to state that, in our opinion, it is not the part of wisdom for our dairymen to select the small, refined cows with a spare habit of body in an extreme degree as the most desirable type of dairy cows.

The Farmers or Dual Purpose Type.—Neither is it the part of wisdom for th dairyman, as such,to select cows of a type similar to those in group C, representing the dual purpose type, and to expect the greatest profit from them in the production of milk and butter fat. For the dairy farmer the large type cow will, we believe, everything considered, be found the most profitable. In view of the results obtained with the different groups, it is apparent that cows with the greatest capacity for consuming rough feed are generally the most economical producers. This may be accepted as a fundamental characteristic of all cows capable of large and economical production in the dairy."

The station's comparisons by breed are striking, and, as usual, the Holstein-Friesian breed is found to excel. Indeed, it seems that, with fair representatives, this great breed will always win in any net profit consideration, where both the butter-fat and skim milk have values signified. The average results of the breed comparison are as follows:

Annual	Holstein	Guernsey	Jersey	Shorthorn
Milk yield	9,987.3	6,530.7	5,700 2	7,121.4
Fat Yield	351.6	319.4	301 1	28 7
Prod. value	$94 03	$82 31	$77 10	$741.26
Feed cost	45.46	37.37	35 22	38.17
Net Profit	48.47	44.94	41.88	36.09

A careful study of this table will show the dairy farmer that it is not the cow that gives the richest milk, but the cow which produces the largest amount of butter fat, that wins out. During all those years, and for all their milk taken in bulk, the average for the Holstein-Friesian milk was 3.52 per cent fat, while the Jersey average was much higher; yet we see that the Holstein-Friesian averaged annually over fifty pounds more of butter fat for each cow than did the Jerseys.

A Surprising Contrast.—But this table does not tell the whole story; the Wisconsin station had even better grounds for deciding in favor of the larger, hardier, more vigorous cows. If a farmer went into the dairy business for five years he would take account of stock at the beginning and at the end of the specified time; and if he found that the herd had increased or decreased in value he would take such increase or decrease into consideration. The Wisconsin station did not do this because it was making a study of milk production only; but it gives a resume of each cow, and we can follow it out for ourselves. The Jersey list reads like a column of obituary notices. Out of twelve cows, one died of congestion of the lungs, one of bronchitis, two were got rid of because of loss of part of the udder from garget, two because found tuberculous, two because such delicate feeders as to be unprofitable, and one because of lack of constitutional vigor and dainty appetite; only three left out of twelve, and they not the best.

The hardy, vigorous Holstein-Friesian cows furnish a surprising contrast to this list. One did so well that a California breeder purchased her last summer and took her to California. The rest are there and still doing business at the old stand, though there is one that Holstein-Friesian breeders would no doubt be glad to get if they could. This is Alma Marie Josephine, who at 3 years old made a record of 18 pounds 5.8 ounces of butter from 400.3 pounds of milk, showing an average for the seven days of 3.77 per cent fat in the milk. The net profit for the one week was estimated at 2.72.

The main deduction which the thinking dairy farmer must draw from the exhaustive work shown in this bulletin is that for the greatest net profit he needs cows of the Friesians; for not only do they give a larger net profit, but by reason of their hardiness and great vitality, the large vigorous Holstein-Friesians thrive on work which will break down and destroy the weakly constitutions of the small, delicately formed Jerseys.—Malcolm H. Gardner, in Farmers' Sentinel.

KINDNESS TO THE COW.

If you expect your cow to do well and yield milk of the best quality and greatest quantity you must treat her kindly. This has been shown by actual experiments made for the purpose of determining the difference in the yield of milk both as to quality and quantity in cows carefully handled and those less kindly handled by milkers.The cow is a nervous animal, susceptible to kind or harsh treatment. Both the amount and quality of the milk she gives depends on her preference for the persons with whom she has to deal. Following up the theory a rigorous experiment was tried on a farm in Essex. Four cows were tried with four different milkers. The favorite milker was honored with nearly nineteen pounds weight of milk one morning, while another less favored only got a trifle over fifteen pounds the next morning, while another cow which had yielded badly the first morning increased her supply as well as the quality the second morning, with the change of milker.

DAIRYING EXPANDING.

The dairying interest of this country is expanding, as might be expected, so that at present we have 17,105,000 milch cows, the value of which is put at $517,000,000. The valuation put upon all other kinds of cattle in this country is said officially to be $824,000,000; the number of cattle put against this part being 45,000,000.

WORMS.

Editor Cultivator: I have a good work horse that is troubled with worms (some are short and called by some pin worms, others very long, from four to eight inches. I think they are stomach worms.) The animal is poor in flesh and does not seem to pick up any, no matter how carefully I feed and care for him. Will you please give formula for remedy for same and oblige.—Subscriber, Los Gatos, Cal.

Give 9 drams aloes in ball after treatment. Bi-sulphate iron pulverized, 4 oz.; gentian powdered, 4 oz.; arsenis acid, ½ oz. Give desert spoonful twice a day.

* * *

Editor Cultivator: I have a colt which is troubled with worms in the bowels. It occasionally passes short flattish worms, and also long round ones, pointed at both ends. Appetite is good but condition poor, and is constantly scratching. Please give remedy. —Subscriber.

Give one pint of raw linseed oil with two oz. of turpentine in one dose. Follow with half dram doses of santonine for five mornings.

TURKEYS.

"I have made more money with turkeys," said a friend in Covina to me last week, "than with any other stock." This was interesting information and reminded me that the turkey is called "the farmer's fowl" in the East. It really should be the farmer's wife's or daughter's fowl, for to them belong the poultry on a farm.

Turkeys are indigenous to America and can be raised in every State of the Union, but in some States such as Kansas, Missouri and Oklahoma, there are still quantities of the original wild turkeys, but I am sorry to say, like the buffalo, they are rapidly becoming extinct. I have lived in the land of the wild turkey and there more than anywhere I learned how to care for the tame turkeys.

* * *

There is no doubt that turkey-growing on a small scale is more profitable than any other branch of poultry culture; I mean the income from turkeys comes easier than from chickens. The little turkeys hatched in the spring and early summer are ready for market by Thanksgiving and Christmas, and bring in ready cash just when one wants it most. I know a farmer's wife living near me who always tries to have a hundred turkeys ready for Christmas, these bring her in a clear two hundred dollars. Exclusive turkey farms, such as the duck and chicken farms in the East, are unknown in California, and even in Kansas, where both turkeys and chickens seem to grow without care, they are usually raised on the same farms as they forage farther away than the chickens and rarely among them.

* * *

Turkeys do not require warm houses, even in the East, but they must have shelter from the rain even in California, and it is wise to be prepared for such contingencies, by having a shed with high roosts in it, where the turkeys can be shut in when the rain comes; this will save the keeper from extra work under disagreeable conditions. The turkeys themselves will often seek the shed before a rain storm. I have one wise mother turkey who always before a heavy fog in the summer comes up to the woodshed and pleads plaintively for an open door, leads her little flock into shelter, whilst on bright nights they go to their pen, and sleep outside. She knows when the heavy mist, or fog from the ocean is coming, when I have not such intelligence.

* * *

Turkeys in their wild state are not very prolific, rarely laying over ten or twelve eggs. Tame turkeys of most strains usually lay only fifteen to eighteen in the first litter, and as the hens lay so few eggs, it is the common practice not to allow them to sit until they have laid two litters of eggs. To avoid breaking and also to induce them to lay longer, the eggs are removed from the nests daily, and if there is danger of the turkeys deserting their nests because of the removal of the eggs, a few hens' eggs may be placed in the nests.

The hen turkey usually begins laying in March or April in the Middle States, but the period varies with the latitude, and here they frequently commence in January and February, according to the season. With my turkeys I find it best to yard them for a time before they commence to lay. I fix coops, boxes or barrels for them to lay in, with clean wheat straw in them, and place them in corners or partially concealed places. Or, when the turkeys cannot be confined to yards, I try to persuade them to choose a box or barrel near the house, and if they seem inclined to wander off, I prevent them until they have once laid in a nest, when they will seldom desert it.

* * *

The natural methods of hatching and brooding are used almost exclusively in turkey raising. I have had very good success by hatching the eggs under chicken hens and raising the young turkeys in a brooder, and I have also raised them under hens, but I prefer the turkey mother. If tame she is exceedingly gentle and quiet with them, lifts her feet slowly and never treads on her babies; she does not wean them too early and protects them from hawks, cats, etc., whilst a good motherly hen is restless and fussy and keeps the young ones too much on the move at first, just when they need rest and warmth and when they should be kept very quiet. On this account I usually take the little turkeys away as they hatch, wrap them in flannel and keep them in a warm, quiet place, then if I have brooder room, I give them a brooder, otherwise I return them to the hen when I have fed her, and I shut her up with them in a dark place to keep her quiet for thirty-six hours.

* * *

The period of incubation for turkey eggs is twenty-eight days, occasionally prolonged to thirty days. As the eggs are almost always fertile, testing is not as necessary as with hens' eggs, but they can be tested in the same way.

When hatching under a turkey hen I usually leave her alone until all are hatched out. A turkey hen can cover from fifteen to twenty eggs, and it is best to set her on the nest in which she has laid, although if very tame she can be moved to any place; this should be done after sunset. A chicken hen cannot cover more than nine turkey eggs. The hens should be well dusted with insect powder every week during incubation to keep them clear of lice.

* * *

The young turkeys will not eat for twenty-four to thirty-six hours, and no food should be offered to them the first day. The mother must be fed. If the nest in which the little turkeys are hatched is so situated that I can put a small pen in front of it I leave them there for a few days; if not I move them to a suitable place. I use the same panels of chicken wire tacked on to six foot long laths for turkeys as I use for little chicks, and keep the turkeys confined in these small pens till they are about two weeks old, moving the pen if the ground becomes soiled until they have "sported the red." This is the trying time of a young turkey's life, something like teething time with babies. All one can do is

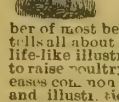
SHOEMAKER'S BOOK ON POULTRY



and ALMANAC for 1904
There is nothing in the world like it. It contains the following: 212 large pages, handsomely illustrated. A number of most beautifully colored plates, true to life. It tells all about all kinds of Thoroughbred Fowls, with life-like illustrations and prices of same. It tells how to raise poultry successfully and how to treat all diseases common among them. It gives working plans and illustrations of convenient Poultry Houses. It tells all about INCUBATORS and BROODERS. It gives full instructions for operating all kinds of Incubators. This chapter is marvelously complete and is worth dollars to anyone using an incubator. It gives descriptions and prices of Incubators, Brooders, and all kinds of Poultry Supplies. In fact, it is an encyclopedia of chickendom and will be mailed to anyone on receipt of only 15 cents. Your money refunded, if not pleased. Address

Geo. H. Croley, Poultry Supplies
508 SACRAMENTO ST., SAN FRANCISCO, CAL.

to keep the turkeys warm and dry, After two weeks, if mothered by the turkey hen she may be allowed to range with them, but a chicken hen must be watched and if she wanders too much I either confine her to the coop or tie her by her leg to a tree. Grit and charcoal must be provided. Lice must be fought just as on little chicks. I never use grease on little turkeys but use buhach or insectonos. Lice and overfeeding cause the death of thousands of little turkeys.

Look for lice between the quill feathers of the wings and rub some good insect powder into them. Do not grease little turkeys, grease is very apt to kill them.

* * *

When I lived in the home of the wild turkeys I learned a great deal that was new to me about feeding little tame turkeys. One thing was to feed them very little, almost starve them and they will grow bigger and stronger than if you over feed. I was also told never to feed corn until the turkeys were big enough to eat whole corn, because it would sour on the little ones' stomachs. I have since found the reason for this, the corn (either cracked corn, or corn meal) does not get softened in the crop, but goes directly into the gizzard, in its hard state, and before the gizzard has time to grind it up, ferments or sours, bowel trouble ensues, and the little turkey dies. So I never feed cracked corn.

* * *

Before giving the little poults to the mother hen or turkey, I dust them well with insect powder, and I go over them at least once a week for lice until it is impossible to handle them, this is when they are about six weeks or two months old. The first food I give the little poults is coarse sand or fine grit. When they are twenty-four hours old I put fresh laid eggs in cold water and let them boil twenty minutes, chop them up finely, shells and all, add equal parts of dry bread crumbs and feed dry what they will eat, taking away what they leave and feeding the mother separately.

The next day I give them egg chopped up with lettuce, dandelion and onion tops cut fine for breakfast, a little curd made of sour milk for dinner and for supper the same as breakfast with curd added; in a few days I give them cracked wheat and steel cut oat meal, also milk to drink, but I never leave either milk or water where they can get themselves wet with it. Turkeys young and old do well if they have milk, sweet, clabber or curds. This feed makes up their bill of fare, with what they can pick up and in California add some meat to their rations. In Oklahoma and Kansas they get all the animal food they require with the grasshoppers and insects, coming home at night with their crops simply crammed full of them.

I am very careful to give the poults green food if they cannot range on grass, and every day I give them an onion chopped fine and after the first week I add cracked wheat and by degrees whole wheat to their egg and bread crumb, so as to accustom them to grain.

The great temptation is to over-feed, as they are very greedy little things, and so tame they follow one round, fairly begging for food. When I cannot resist their importunity I throw them a head of lettuce, which will keep them busy and amused until I escape into the house.

* * *

I know that lice and over-feeding are responsible for the great mortality in little turkeys, and the trouble is that if they are over fed at first they will grow so fast and seem so well that one will begin to think it was all a mistake about over-feeding, that they can eat as do chickens or ducks. They may when full grown, but with the little ones, until they have "sported the red" they must eat a little at a time, and must exercise to make their food digest. It is a curious fact that overfeeding stunts them. If you open those that die you will find the liver spotted, this indicates a diseased liver. Mrs. Jones, an expert turkey grower in the East, writes:

"What causes a diseased liver? Too much work. What causes the liver to do too much work? Too much blood to strain. And what makes too much blood? Too much food and not sufficient exercise. This in a nutshell is the cause of so many turkeys dying.

They grow so fast and have voracious appetites. If the food is set before them they will eat it instead of hunting for it and it takes from only four to six weeks for them to eat themselves into their graves. If they hunt for their food, they take it leisurely. The digestive organs are not hurried. They take just what nature requires and can digest, and just enough goes into circulation to keep them in perfect health, strong and vigorous.

* * *

The Standard recognizes six varieties of turkeys, the Bronze, which are the largest; the Narragansett, in color are grey; the Slate color, Buff and Black, and the White Holland.

The Bronze are the favorites on account of their immense size, the first prize gobbler at the Los Angeles show last month weighed fifty-four pounds; quite a meal for a family. The White rank next to the Bronze in popularity; they are smaller but very delicious eating, and dress beautifully, having no dark feathers.

I prefer them to the other varieties and still keep them—they lay more eggs and do not wander far, always roosting near the house and so are not as apt to fall victims to nightly marauders as the other kind. They are very vigorous and healthy and I rarely lose a young one except by accidents, three drowned themselves in the wash tub, and five had their heads crushed in a door. The White Holland bear confinement better than any other that I have kept, they appear more domesticated than the others, further removed from their wild ancestors.

Turkeys hatched from now to July will be ready for Thankgiving and Christmas.

I think I have answered every question asked me about turkeys.

It is a pleasure to me to answer letters through the Cultivator, especially when those I try to help write me that my suggestions were fruitful of good results. It saves me many hours of work for when I answer in the Cultivator it is letting the whole country know it. I have never seen a greater news bearer; it scatters news broadcast over the whole earth. As sure as you put anything on the pages of the California Cultivator you will hear of it again.

* * *

A correspondent from Tropico asks, "What are the 'mushroom' houses mentioned in Mrs. Basley's article?" My mushroom houses are small houses standing on legs about six inches above the ground; they are about six feet long by three feet wide and will hold easily a dozen hens or twenty-five chicks. I think they are called "mushroom" because they stand up above the ground, or because they are quickly made. They are perfectly tight all round and the roof, all the ventilation being from below. The air passing over the droppings carries away all smell, and the house is always sweet and pure. In the Cultivator of April 25th, 1903, I gave directions for making these houses.

CRUDE OIL FOR PEACH BORERS.

Editor Cultivator.—In regard to the use of crude oil as a remedy for peach-borers I can say that D. B. Pickering of Santa Clara, Cal., has tried a crude oil of asphaltum base for two years and has been able to kill and keep out the borers from his trees. This work has been done on young trees which shade the ground well and which are growing in adobe soil, which is considered a cold soil. What we can do in sections, which are termed the warm belt and where the soil varies from a gravel to red chemise soil, we cannot now say. Whether or not these warm soils have any influence on the oil which would cause it to be absorbed by the bark and do injury, will be known this coming season, as a great many growers in every section are trying a few trees with crude oil and have promised to keep a record and report. The party to whom you refer as killing 500 trees, I am told used a distillate oil which was used as fuel for a gasoline engine, probably of a paraffine base. I am very glad indeed that you will have an article on crude oil and the different distillates and I believe it would be well to have some one give some information in regard to the emulsions of crude oils with soap, caustic sodas, etc, etc, as very little is known about these matters.

If crude oil of an asphaltum base can be used below the surface line without damage to the tree, it will be a great remedy and a great saving to the fruit grower. The fact that crude oil causes most of the borers to leave the bark, will obviate the tedious digging out with the knife, which is so expensive.

I am sorry that I am unable to give you more information or data on this subject.—Edw. M. Ehrhorn.

RELATION OF SOIL TO CROP PRODUCTION.

The bureau of soils of the department of agriculture has just issued a bulletin, No. 22, entitled, "The Chemistry of the Soil As Related to Crop Production." The bulletin represents the work of Milton Whitney, chief, and F. K. Cameron. It discusses the influences of climate, texture of soil, rotation of crops, variety of plants and commercial fetrilizers on production, and concludes with a number of deductions, the most noteworthy of which is the statement that practically all soils contain enough plant food for the production of good crops, and that there is no evidence that this supply will ever be exhausted. The investigators say "that the actual yield of plants adapted to the soil depends mainly, under favorable climatic conditions, upon cultural methods and suitable crop rotation, and that a chemical analysis of a soil, even by these extremely delicate and sensitive methods, will in itself give no indication of the fertility of this soil or of the probbable yield of a crop, and it seems probable that this can only be determined, if at all, by physical methods, as it lies within the domain of soil physics."

CARE OF CELERY.

No vegetable, with the possible exception of the tomato, has made such progress in public favor as celery. We can remember when a few heads or bunches were sold at high prices and then purchased only for special occasions and by the wealthy. Now it is almost daily in use by the public. There are many reasons for its popularity: Two of these are, for us sufficient to name, its healthfulness and its usefulness. As a tonic it is considered a powerful nervine. It is prized for its cleaning and purifying effects upon the system. Used as an appetizer with a pinch of salt, it is a welcome addition to almost any dish. For any occasion its beauty adorns the table. The average farmer, to a surprising extent, has come to recognize these facts and such can and should have as good as there is going. Thus, from a luxury, celery has become a necessity—almost a regular feature of the noon-time meal.—J. P. Roe in Farmers' Sentinel.

TO KILL BERMUDA GRASS.

There is no end to the inquiries, says the Chronicle, how to kill Bermuda grass or Johnson grass or other plants with powerful root systems which have got into the orchard or garden. There are two ways and no more. The first is to get every particle of the root out of the ground. If there is a joint an inch long it will start the whole business over again. This method may be economically possible when there is not more than one or two bunches to be dealt with. The other method is by the use of any convenient tool to prevent a single leaf of the stuff to show above ground for more than twenty-four hours. This treatment, kept up for about two seasons, will usually make an end of the grass. Where it does not it is because some leaves were overlooked in the ministration.

CALIFORNIA RAISIN CROP.

The raisin industry in California dates back about thirty years, as raisins were first produced in a commercial way in 1873. Since that time the increase has been remarkable, for today there are upwards of 3,000 individual growers cultivating about 90,000 acres of vines as their only source of income. The average annual yield of grapes is about 300,000 tons, of which 150,000 to 175,000 tons, in favorable seasons, are cured annually and made into raisins, the balance marketed as table grapes, and made into sweet wine and brandy.—Exchange.

THE ONION CROP.

The total production of onions in the United States for 1903 is estimated at 3,000,000 bushels, being a little less than that of 1901. The yield in 1902 was something over 3,800,000 bushels for the entire United States. In 1899-1900 the banner yield of this vegetable was produced, the crop being over 4,500,000 bushels.

CALIFORNIA BEET ACREAGE.

The area of land devoted to the culture of sugar beets in California is approximately: Ventura county, 21,000 acres; Santa Barbara, 7,700; Alameda, 5,400; Orange, 4,800; Los Angeles, 4,600; Solano, 4,400; San Bernardino, 4,000; San Benito, 4,000; Contra Costa, 2,500; San Luis Obispo, 1,700; and Sonoma, 1,000.

CUT BIG RANCHES INTO SMALL ONES.

The California Promotion Committee is advocating the cutting of large holdings in this state into small ones. Discussing the advisability of this move a member of the committee said, last week:

"I believe the division of large holdings into tracts which will invite colonization by men of limited capital is the most important step in the development of agricultural California. William Henry Hershey, an expert Swiss cheese maker, who states he has a family of eighteen children, is now in San Francisco waiting to get a dairy. He wants a small tract. We are constantly receiving demands of a like nature from other settlers.

"If the large land owners will all divide their tracts and announce that fact these men will get what they want. The California Promotion Committee has heard from about fifty owners that they will do this."

NO EXCEPTION

Last year we said the Tilton Apricot was a regular bearer. NEVER FAILS. This year is no exception. Every tree bore heavily; old ones as well as the newer planted orchards.

Fifteen Years' Test
and still the

TILTON APRICOT

Is a winner. Large, highly flavored, good color. In the dried fruits the Tilton won First Premium at the Great Central California Fair. Liked by canners. Original tree 18 years old near our nursery. Buy trees where you can get true to name buds from original stock from the Original Tilton Nurseryman. A thrifty lot of peaches and other deciduous trees.

J. W. BAIRSTOW, HANFORD, CAL.

THREE LEAVES OF SHAMROCK.

When leaving dear old Ireland,
In the merry month of June,
The birds were sweetly singing
And all nature seemed in tune;
An Irish girl accosted me
With a sad tear in her eye,
And as she spoke these words to me
She bitterly did cry:

"Kind sir, I ask a favor,
Oh! grant it to me please;
'Tis not much that I ask of you,
But 'twill set my heart at ease,
Take these to my brother Ned,
Who's far across the sea,
And don't forget to tell him, sir,
That they were sent by me"
Chorus:—
Three leaves of shamrock,
The Irishman's shamrock,
From his own darling sister,
Her blessing too she gave.
Take them to my brother,
For I have no other,
And these are the shamrocks
From his dear old mother's grave.

Tell him since he went away
How bitter was our lot,
The landlord came one Winter day
And turned us from our cot,
Our troubles were so many
And our friends so few
And brother dear, our mother,
Used to often sigh for you.

"Oh! darling son come back to me!"
She often used to say.
Alas, one day she sickened,
And soon was laid away,
Her grave I've watered with my tears,
That's where these flowers grew,
And brother dear, they're all I've got,
And them I send to you.

TRAINING A HUSBAND.

That I must have a confidant is clear. Just think of me, a woman, keeping a secret a whole year! and such a joke, such a series of jokes! I laugh every time I think of them.

There is not one human being I dare trust; they would either be so amused or so shocked they would disclose everything, and then—that is a catastrophe I do not care to anticipate.

I will tell the world—not one, but all—then who need whisper what all know? I thus relieve my mind, let all who care to read share my mind, let all who care to read share my laughter, and keep my secret too; for even my husband may read and smile and never dream, dear innocent soul! that he is the hero of my truthful tale. I will so alter and reconstruct his outward appearance and picture so truthfully his personality that he will not only fail to recognize the protrait, but swear it was not meant for him.

Fred is a good-looking, stylish fellow, on the right side of thirty.

"That might be me," exclaim all the young husbands reading this, emphatially, if not grammatically.

But he is the most obstinate, conceited, selfish man you can imagine.

"Oh! that must be some other fellow," they all exclaim.

On the other hand, I am very charming, pretty, stylish, and amiable. I am not yet twenty-five, and know more than poor dear Fred ever began to. As I am the only person who would recognize this portrait, except, possibly my mother, I consider my characters sufficiently disguised to tell my story safely.

Fred and I had been married four years and wedded life had begun to lose some of its charms. I had no family or housekeeping cares to occupy me. We live in a small town noted for its social life, but Fred, from being a society youth, a leader of the "German," had forsworn such vanities. Things were "slow." When Fred came home at night from smoking and gossiping downtown—he called it business—we would have to get up a quarrel after dinner, just to amuse ourselves.

Finally Fred got in the habit of telegraphing home and staying down to dine with "the boys," while I took my meal in solitary state; or if he dined with me, in the evening he would drop in later at the club for a game of whist. As a last straw he became interested in the militia, and had about decided to join the "National Guard."

Now there was a very silly thing which I would not have had Fred know for anything. Despite his selfishness and his looking upon me as an "oft-told tale," I was still very fond of him. Even the quarrels, as long as he was near me, were better than absence and indifference. I was truly unhappy, but felt quite helpless as I had little faith in protestations and remonstrances. I knew, from my own experience, that what Fred needed were novelty and excitement.

"I do wish something would happen! If the house would catch fire, or I could have a fever—not a bad one," I exclaimed aloud one night as I sat alone in the house. Our solitary maid was out with her "soldier boy," and Fred had "dropped in" at a neighbor's for a game of cards.

There was a rustling sound at one of the windows.

"Burglars!" I whispered joyously, but alas! it was only a stray breeze playing tag with some loose leaves. I would not be disappointed—I would have burglars. I determined to experiment. Private theatricals were my joy and Fred had just vetoed my taking part in some. He did not approve of them since our marriage, though he had been very enthusiastic about them formerly.

"Well, young man," I soloquized, "I will get up some private theatricals myself, and as there are no love-scenes, perhaps you won't object. If you are good you can have a complimentary ticket."

I went down to the kitchen, and with a knife-handle broke a pane of glass, making a place large enough for a man's arm to go through. Then I turned the catch and left the window unfastened.

"This is where 'my burglar' got in," I explained.

Next I opened the sideboard drawers and rather disturbed their contents.

"No use, Mr. Burglar," I laughed, "silver is all upstairs."

In going through the hall I disarranged the rugs, as a person would be likely to do in making a hasty exit. Upstairs I upset the contents of three bureau-drawers in a heap on the floor, feloniously purloining some empty purse.

The scenery now being ready, it was high time for the actors to "make up." Rouge? Out of the question. Lily-white? With discretion; it would never do to have the water they might dash in my face run off like city milk. Hair, loose and disheveled as brush could make it. Bruises? Well, I did try them with ink; but not being much of an artist decided to omit them. A few rents in an old gown added considerable to my picturesque appearance.

Ten o'clock and eight minutes. All ready? Ring up the curtain while I bring in the audience.

I hurriedly ran downstairs, turned out the hall light, and threw the front door wide open. No one in sight. I threw an empty purse upon the stoop and hurried to the telephone. I rang violently, then dropping the ear piece, where I allowed it to remain, I scream:

"Burglars! Burglars!! Burglars!!! Help! My husband! Sniffins! Call him! Help! O-o—!"

Still screaming and calling as I left the "phone," I hustled about a couple of chairs, making a distracting noise. Then, hearing approaching footsteps, I threw myself upon the floor and lay apparently swooning.

In rushed Fred, Sniffins, and several others.

"How was it? Did they get anything? Are you hurt? How many were there? How did they get in? Where did he get out?" were only a few of the questions, all asked at once.

As I could not answer all, I merely screamed.

Of course Fred was frightened about me, so to keep his interest up I had a regulation attack of hysterics. I really could not help them, I was so suffocated with laughter. It was such fun to see them so excited! I had fully intended to tell them in a few minutes, but Fred enjoyed himself so hugely, he was in such a delightful state of importance, I had not the heart to crush him.

As time passed I could not fail to see that Fred regarded me as quite advanced in years, though I had just reached the quarter of a century mark. He began to pay attentions to the young ladies he met in society.

"Mollie," Fred said to me one day, "I would not dance so much if I were you."

"Why?" I innocently asked.

"Because, my dear, when a woman gets to be your age it is really better taste to sit down most of the time and make room for the girls."

"I will sit down every dance, with you, Fred," I responded, beamingly.

"I did not mean exactly that, Mollie. Of course I would prefer it, but there are generally so few dancing men I feel it my—ahem—duty to dance."

There was no question in my mind that he was very much interested in one of that season's "buds," a girl flavoring of bread-and-butter and the school room. Men display such peculiar taste in such matters. Of course I was foolish to be jealous of Fred's harmless attentions still they were such as he would not have liked me to receive. I knew jealousy was the medicine Fred needed, but how to administer it was the problem. Flirt myself, I would not; I had too much self-respect for that.

An inspiration! My medicine, like the physicians' sugar pills and colored water, should be a justifiable hoax.

I took a pen and wrote in a broad masculine hand: "Mollie: You know not how I suffer when I see you and realize anew that we are indeed parted forever. My only comfort is his indifference. While he is dancing with others I can be by your side looking into those azure eyes, listening to the sweet voice I love so well.

"O my darling! Why did you choose him in preference to one who worshipped you? A word and a smile from you are now my greatest treasures. Surely in time, his coldness and my devotion will turn your heart to one who in all these years has never wavered in his devotion."

When I finished this absurd letter I folded it many times and creased it that he might think it long carried and often read; then I dropped it where Fred could not fail to find it.

It worked charmingly. Fred came down to dinner with a countenance usually reserved for a fall in stocks. He could not even relieve his feelings by finding fault with the meal, as men generally do. I might draw comparisons.

"Darling, would you mind very much if we did not attend Anderson's reception tonight?? I have a headache," said Fred.

"Darling!"—I had been nothing better than "Mrs. S." or "Mollie" for months.

"I am sorry you feel ill, Fred," I said, gong over and kissing him, for I had some compunctions, "but hadn't we better try and go. You know the girls will be so disappointed, they depend on you so much as a partner."

"The girls be hanged!" he exclaimed, under his breath, but I heard it with great joy.

"Shall I read to you, dear?"

He gladly acepted my offer, and cheered up somewhat when he found I

Lamp-chimneys that break are not MACBETH'S.

If you use a wrong chimney, you lose a good deal of both light and comfort, and waste a dollar or two a year a lamp on chimneys.

did not seriously object to remaining at home with him. The poor fellow grieved so that many times I could with difficulty refrain from telling my secret; but the thought of those odious girls would seal my lips.

Fred never referred to the letter, but was so devoted to me when we went in society that no opportunity offered for my former lovers to show me their constancy—had any one been so inclined.

But the greatest and best joke is young Fred. His father is so delighted with him, and he proves such an unfailing source of novelty and excitement, though he is now two years old, that I have no further use for my private theatricals.

I often laugh over the past, and right merrily; for a more loving, devoted husband than mine never gladdened the heart of woman.—Catherine Mortimer.

RECIPES

Eat Little, but Have That Little Good

OYSTERS AND CELERY ON TOAST

Chop fine a cupful of celery; add to this six or eight large oysters, also chopped. Put on the fire a half pint of any light stock, and simmer in it the celery until partly tender; add the oysters, one tablespoon of butter rubbed smooth with the same quantity of flour, a dash of red pepper, a level teaspoonful of salt, and just before serving a teaspoonful of lemon juice. Cook for five minutes and pour on rounds of buttered toast.

* * *

OYSTER OMELET.

For this the oysters are parboiled in their own liquor for exactly five minutes; drain thoroughly, cut each oyster in half, and sprinkle with salt and pepper. Make an omelet of three eggs, beaten light, half a cupful of milk, and two drops of nutmeg with salt to taste. There is also to go into this a tablespoonful of flour or cornstarch containing half a teaspoonful of baking powder. Add the oysters to this—you will need at least a dozen—and cook as you would a plain omelet.

* * *

OYSTER STEW.

The making of this is simple, and yet it is a dish of varying quality in the hands of different cooks. To have it in perfection, wash the oysters and drain them, then put them on to cook in just enough boiling water to cover them. Let them stew gently until the edges are slightly curled, then add part milk and part cream in the proportion of two cupfuls to a pint of oysters. Let this all come to a boil, then season to taste with salt, pepper and butter, with half a cupful of finely rolled cracker crumbs. Serve at once.

* * *

OYSTERS — MUSHROOM SAUCE.

This sauce calls for half a pint of strong brown stock, not, however, too highly seasoned with vegetables. Place on the fire, add a dozen fair sized mushrooms chopped or broken in small pieces. Simmer gently for twenty minutes, adding when half done a heaping teaspoon of butter rubbed with the same measure of flour. Season with salt and pepper, strain and keep hot while you stew a pint of oysters in just enough water so that they will not stick. If desired very rich they may be stewed or "plumped,' as it is called, in clear butter. Pour the sauce over and serve in individual dishes or in paste shells.

* * *

OYSTERS IN TOMATO SHELLS.

Chop rather fine one dozen large oysters; mix them with equal bulk of cracker crumbs, one beaten egg, a teaspoonful of chopped parsley, cayenne pepper to taste, also salt, and a little nutmeg or mace. Cut tomatoes in halves, scoop out the seeds, and fill with the mixture, placing small pieces of butter on the top of each. Bake with a little water in the pan for about twenty minutes.

* * *

Oyster Gumbo.—Cut up the meat of one medium sized chicken in small pieces; dredge them with flour and brown in the spider with three or four slices of bacon also cut in pieces. Add one small onion, minced, and about two quarts of water or weak broth. A tablespoon of tomato or mushroom catsup, some minced celery or parsley, with salt and pepper to taste may also be added. Simmer for three hours, then add three pints of oysters, and cook for two minutes. Just before serving add half a cupful of gumbo file.

* * *

Spanish Braised Beef.—Slice two small carrots, one onion, one turnip, and one stalk of celery, and lay half of them in a saucepan. Take about three pounds of lean beef and roll it in yellow cornmeal that has been well seasoned with salt and pepper. Place this on the vegetables, and then add the rest of the vegetables with just enough water to keep the beef moist. Cover and let simmer for about three hours, or until the meat is tender. If the meat is quiet lean, some butter must be added. Dish the meat and vegetables separately, and make a lemon sauce, if liked for the beef.

* * *

Stuffing for Roast Goose.—For a medium sized goose soak one ordinary loaf of bread in cold water for half an hour. Squeeze dry, and add to it two cupfuls of chopped tart apples, one onion chopped, and sage and thyme to taste, also salt and pepper. No butter is needed, as geese are so fat. Many prefer a mixture of apples and mashed potato, with the usual seasoning of sage and onion. The giblets may be cooked as for turkey, chopped and added to the dressing, or used for giblet sauce or gravy.

THE IDEAL HOME.

The foundation of modern civilization and the very cement of moral society are the family and the home. In savage life the spirit of individualism predominates; there is no instinct of solidarity, but as a man becomes civilized he realizes more and more the value of co-operation, and the more truly civilized he becomes the more coherent become the family and the home. Sever a man or a nation from the ideal of singleness of matrimonial alliance, the family and the home, and at once there is a debasement in moral life, and woman, as some one said, instead of being what God intended her to be, "a helpmeet to man," becomes his plaything or slave.

Home is the place that we love best, because it is the place where mother is, and there, because of her loving and fostering care, is the place of greatest earthly security. Man cannot create the home atmosphere; he may climb to great heights of fame; he may win great battles; he may triumph over all competitors, and thereby amass great riches; he may master the scineces, acquire a facility in innumerable languages, live or dead, but man, with all his power, genius and native ability, cannot make a home. That remains the task of woman and in this she remains supreme. Home ought to be the place where we can find the most refreshing rest. Home ought to be a place of genuine warmth; but some homes are as cold as ice, which breathe an atmosphere as cold as a breath from the polar zone. Let our homes be places of joy, love and brightest sunshine. Home ought to be a place of enduring love, the love which outlast the wedding-day and produces a life which is one long, unbroken honeymoon. Home is the molding place of character. Your child has a right to insist that you live such a life as will exalt the standard of true manhood and true womanhood. Your child has a right to demand that you do nothing to stain by sin the name you bear and which you bequeath to him as a life-possession. Give your child a sweetly religious atmosphere in which to grow; not one of monotonous "don't" and "you must not," but one that presents the attractive side of Christianity. Let Christ be the unseen but truly recognized guest at your home, and teach your child the religion of "the Book."—G. R. Stair.

Men are apt to fret and worry,
But what's the use?
Just to keep business boomin"
Men do lots of things inhuman—
Even argue with a woman;
But what's the use?

"The Quality Store."

You Need a Top Coat...

These cool mornings and evenings make it imperative that you have a top coat. Good taste demands that you have one that is absolutely correct in fit, style and finish. If you would choose from the best stock in the west, come here.

TOP COATS, $10 to $42.50
OVERCOATS $10 to $60.00
GOOD SUITS, $10 to $40.00

PRUNING THE ORANGE.

(Continued from first page)

ity of the crop. Judicious and abundant fertilizing, proper irrigation and thorough cultivation are rightly regarded as necessary factors in bringing about a good result. Some orchards, or parts of orchards, have naturally differing products, which treatments will not avail to change.

Already, to a limited extent, the proper pruning of the orange tree has been shown in actual practice to have a beneficial effect in the production of fine fruit, but when other controlling influences have not been sufficient, or of the right sort, correct pruning alone can not bring about desired improvement.

A Striking Illustration.—In one of these instances of thorough pruning with a well defined purpose and plan, so thoroughly carried out on some old trees that only four of them could be treated in a day, a traceable effect was seen the same season, almost wonderful as compared with former years. The parts removed, dead and living, littered the ground beneath and around, and seemed equal in quantity to the branches remaining. The trees took on new life, blossomed freely on the limited growth of the preceding season, put forth new shoots and bore a fine crop. Every branch of the diminished number was an efficient fruit bearer, save a few, still crowded, which the pruner was too timid to cut off. The fruit was strikingly uniform in size and appearance and regular in shape, and of superior flavor. It was plainly of higher grade and in greater quantity than that on adjacent trees on similar soil, with the same treatment except as to pruning.

Ideal Form.—If orange trees should be pruned, and if the pruning is of great importance in growing high grade fruit in large ratio, and in producing good crops, undiminished in quantity by the process, especially in merchantable quantity, then there must be a certain shape and condition of the tree aimed at in the work. The mind of the pruner will entertain an ideal form to which he will try to bring the tree, but as ideals are always, in practice, unattainable, he will come far short of the perfect shape he desires, especially if the tree has been neglected. At the foundation of the methods of procedure, there must be principles governing the work.

These principles cannot be arbitrary, the dictum of a sensible, experienced man, to say nothing of a crank, but must be founded on well known laws of the life and growth of plants; nor must we be tempted, in acting according to our knowledge of particular laws applicable to the work, to disregard other laws, or assume too much knowledge, and act with too much zeal in this one direction, and go astray, riding a hobby. The forming of the young tree is admirably described in Wickson's "California Fruits," after the method of J. H. Reed, of Riverside.

Be Discriminating.—The ideal object to be kept in mind by the pruner is to cause the bearing orange tree, just like the well-formed young tree, to have only such limbs grow as radiate outward from the trunk or divided stem. The lower limbs, as they have served as fruit bearers, will curve downward, and the higher ones will extend upward at an angle more or less acute, according to their age and bearing stage. Then each limb, if its vigor entitles it to remain, is to be treated as an independent unit and provided with ample space for the work of its foliage. The shoots, often quite large, that grow vigorously upright from the outward extending limbs, and the suckers, sometimes as large as principal limbs, if natural growth has not been interfered with, originating in the body of the tree and towering up through the favored branches with intent to form a second story, must be taken out. In some trees, such treatment becomes, at times, heroic, if neglect has prevailed. In others, a choice must somtimes be made in their favor, if they have continued so long as to leave the original top branches diminutive and weak.

In general, if these aspiring growths remain, they will ultimately dominate the tree and change it to a wood-forming, or timber tree in so far as this condition is predominant. The wood thus formed and located will, it is true, eventually become the home of fruit, but at the immediate expense of the regular fruiting limbs and the injury of the quantity and quality of both their fruit and their provision for new fruit twigs. These vigorous upstarts, when becoming productive, will bear fruit of a coarseness commensurate with their own rank growth. Besides advancing the tree top to an inconvenient height they interfere seriously with the true fruit limbs, and hold their own fruit exposed to weather injury.

(Concluded Next Week.)

BUSINESS NOTES.

The shops of the Fresno Agricultural Works are turning out a large number of cultivators and scrapers these days. The plant which was originally established for local or San Joaquin trade has extended its field till now it ships implements all over the country. While in Imperial Valley recently, the writer saw many of those Fresno graders there and on inquiry learned that they were the favorite and more, were almost exclusively used. A catalogue gives much information besides the line of goods manufactured by the works. Drop a card to the works at Fresno.

The Macabee gopher trap is one of the favorites with those who are pestered with gophers. It is claimed for it that it will catch eighteen out of twenty if it is set according to directions. It is manufactured by L. A. Macabee of Los Gatos.

The Maule Seed Book for 1904 is issued and while we have not seen it we are told it is a most attractive and creditable book. It is of 144 pages, many illustrations, seven of which are color plates. The book may be had by addressing Wm. H. Maule, Philadelphia.

A. Yarnell, of the Vernon nurseries, is preparing to offer a big lot of fine rose bushes to the trade next year.

S. H. Taft, of Sawtelle, advertises walnut trees. These are pronounced as especially fine stock.

I WILL GIVE $1000

IF I FAIL TO CURE ANY CANCER OR TUMOR

I treat before it Poisons Deep Glands or Attaches to Bone.

NO KNIFE OR PAIN, NO PAY UNTIL CURED.

NO X-RAY OR OTHER SWINDLE.

A Pacific Island shrub or plant makes the cures—the most wonderful discovery on earth to-day. **3000 CANCERS** cured on people you can see and talk with. **ANY TUMOR, LUMP OR SORE** on the lip, face or anywhere six months is, *nearly always*, Cancer. Poor cured free if cancer is very small on face.

ANY LUMP IN WOMAN'S BREAST IS CANCER

It does not pain until almost past cure, and if neglected it **ALWAYS** poisons the deep glands in the armpit, then it is often too late and still no pain. Deep in the shoulder death is certain. In 30 years I have cured more cancers than any other Doctor living. **INVESTIGATE MY ABSOLUTE GUARANTEE. BE SURE TO GET MY 120-PAGE BOOK,** sent free, with symptoms, addresses and testimonials of thousands cured, and write to them.

San Francisco Markets.

Dairy.

San Francisco, Jan. 21, 1904.

Increased offerings checked the values for butter yesterday, but a steady call caused the market to maintain a firm tone. Receipts yesterday aggregated 46,700 pounds Butter, 1142 cases Eggs, 6300 pounds Cheese.

BUTTER—Per lb:

Creamery, extras	31
Creamery, good to fancy	27½ 30
Dairy, extras	25 26
Dairy, choice	22 24
Store	17 @18
California storage	21 @24
Eastern Creamery	Nominal

Eggs and Poultry.

Eggs show a decline all along the line, with a prospect of going even lower. Buyers are cautious and anticipate lower figures.

EGGS—Per doz:

Ranch, selected large	27 27½
Ranch, good to choice	24 26
Store	21 23
California storage	Nominal
Eastern	Nominal

The Poultry market maintains a strong front, as all offerings are quickly disposed of. All Eastern goods are speedily taken up.

POULTRY—Old Roosters, per doz, $5.50@6; young Roosters, $6.50@7.50; Fryers, $5.50@6; Broilers, large, $5@5.50; small, $4.50@5; Hens, small, $5@6; large, $6@7; Ducks, per doz., old $5.50@6.50; young, $6.50@7.50; Live Turkeys, per lb., 16@18c; Dressed Turkeys, per lb., 18@21c; Geese, per pair, $2@2.25; Goslings, $2@$2.25; Pigeons, per doz., old, $1.25@1.50; Squabs, $2.25@2.50.

Fruits and Vegetables.

There was a marked falling off in the demand for Fruits Thursday, and the market again presented a tame and listless appearance, with little interest shown beyond the regular daily routine movement in jobbing channels.

DECIDUOUS FRUITS.—Apples, per box, common to choice, 40c@$1.00; fancy, $1.25@$1.75.

PEARS—Per box, Winter Nellis, $1.50@2.

CITRUS FRUITS—Per box: Oranges, Navels, fancy, $1.75@2.25; choice, $1@1.50; standard, 65c@$1, acording to size; Seedlings, 60@85c; Lemons, $1@2.50; extra, $2.75; Japanese Fruit, $1@2; Tangerines, 50c@$1; Japanese Mandarins, $1@1.25; Limes, $4@4.50.

The potato market showed general activity for the past week, the demand being strong.

POTATOES—Per ctl.: River Burbanks, 75c@90c; Early Rose nominal; River Reds, 60@70c; Salinas Burbanks, $1.35@1.50; Oregon Burbanks, $1.15; Sweet Potatoes, $1.85.

Onions—Yellow, per ctl., $1.25@1.40.

VEGETABLES—Tomatoes, per box, Bay, nominal; do, southern, per crate, 75c@$1.25; Rhubarb, per lb., 6c; Green Peppers, per lb., 7c@10c; Dried Peppers, Stockton, 5@8c; southern, 11@12c; String Beans, per lb., 10@15c; Wax, 10@12½c; Green Peas, per lb., 3@5c; Egg Plant, per lb., 10@15c; Summer Squash, per box, $1@1.15; onions, yellow, per ctl., $1.40@$1.50.

Dried Fruits, Nuts, Etc.

The market shows no change this week as to dried fruits.

DRIED FRUITS.—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 3½@6c; Sun Dried, 3¼@4c.

Apricots—Royal, fancy, 9¼@10c; choice, 8½@8¾c; Moorparks, choice, 10@12c.

Peaches—Choice, 5@6c; fancy, 6¼@7c; peeled, in boxes, 11@14c.

Pears—Choice, 7½@8½c; fancy, 9½@10c.

Plums—Pitted, 6@9c; unpitted, 2c.

Prunes—Four sizes, 60s to 100s, 2½@3c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Red, 4@5c.

Figs—White, 4@5c; Black, 4@4½c.

NUTS—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Pecans, 11@13c; Pinenuts, nominal; Peanuts, Eastern, 6@6½, do, California, nominal; Brazil, 11@12c; Filberts, 10@11c; California Walnuts, soft shells, No. 1, 13@14; do, No. 2, 11@12c; hard shells, No. 1, 12@13c; do, No. 2, 10@11c; Hickory, 8@10c, Chestnuts, Italian, 9@10c; Coacoanuts, $4.50 $5.00 per hundred.

HONEY—New Comb, per lb., White, 10@12c; Amber, 8@10c; Extracted Water White, 5½@6c; Light Amber, 5@5½c; Dark Amber, 4½@5c.

BEESWAX—Per lb: 23@28c.

Beans.

BEANS—Prices, per ctl.: Large Whites, $2.50@$2.65; small do, $3@3.15; Pea, $3.05@3.20; Lima, $3.15@3.20; Red, $3.50@4.25; Pink, $2.80@$2.90; Bayo, $2.30@2.50; Blackeyes, $2@2.15; Red Kidneys, $4.25.

DRIED PEAS—Prices, per ctl.: Green, $2.50; Niles, $2.75.

Live Stock.

Depressed condition of hogs and cattle market continues. Prices unchanged.

CATTLE—No. 1 Native Steers, 8½@8¾c; second quality, 8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6½c; second quality, 6½@6c; thin Cows and Heifers, 3½@5c; Bulls

and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 4¾@5½c, gross weight; heavy, 4¼@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 4@4½c per lb., gross weight; Ewes, No. 1, 3¼@3¾c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4¾@5¼c per lb., live weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs. and over, 5@5⅛. Market depressed; tendency downward.

Hay and Feed Stuffs.

HAY—Per ton: Wheat, $16@17.50; Wheat and Oat, $15.50@17; Oat, $14.50@16.50; Barley, $14.50@16; Clover, $13@14; Alfalfa, $13@14; Stock, $11@12.

STRAW—Good to choice, per bale, 55@65c.

FEED CORN MEAL—Choice grades, per ton, $28@29.

MIDDLINGS—Per ton, $27@29.

BRAN—Per ton, $20.

OILCAKE MEAL—In lots of 20 tons, $27 per ton; 10 tons, $27.50; 5 tons, 28; less quantity, $28.50. Prices are mill rates and are subject to change without notice.

GROUND BARLEY—Per ton, $24.

COCOANUT CAKE—In lots of 10 tons, $21; 5 tons, $21.50; less quantity, $22. Prices are mill rates and are subject to change without notice.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@4.85 per bbl; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—No. 1 shipping, per ctl., $1.37½; white milling, good to choice, $1.40@1.52½.

BARLEY—Choice No. 1 feed, $1.11¼@$1.15; off grades, $107½@108¾; brewing, No. 1, $1.17½@$1.22¼; Chevalier, $1.30@1.45.

CRACKED CORN—Choice quality, per ton, $28.55@29.50.

OATS—Good to choice white, $1.30@1.40.

Hops.

The price for new crop is 23@27½c per lb, acording to quality.

WOOL.

The wool market shows no material change from last week's quotations.

Fall clip, per lb: California Plains, 6@8c; Foothills, 8@10c; Middle Country, 10c@12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

CHICAGO, Jan. 21.—The wheat market has been strong all this week, due largely to certain conditions and the demand for May delivery. Efforts to cover shorts advanced prices rapidly. The market continued to gain in strength as the session advanced, and within the last five minutes of trading May had reached 92⅛@92¼c, a gain of 2¼c. The close was at 92½c. Corn was strong throughout the entire session. A new high record for May delivery was also made in this pit. May opened a shade lower to a shade higher at 49¾@49⅞c, and after selling up to 50⅝c, closed at 50⅝c. The strength in wheat and corn sustained oats and prices made further gains. May opened a shade lower to a shade higher at 41⅜@41⅞c, advanced to 42⅝c, and closed at 42⅜@42½c. Provisions were firm owing to the strong grain markets.

Cash quotations were as follows: Flour was firm; No. 3 spring wheat, 78@86; No. 2 Red, 86@92¼c; No. 2 Corn, 46¾; No. 2 yellow, 48; No. 2 oats, 39@39½; No. 3 white, 37½@41½; No. 2 rye, 56; good feeding barley, 40@42; fair to choice malting, 47@58; No. 1 flax seed, 1.06; No. 1 Northwestern, 1.12½; prime timothy seed, 3.25; mess pork, per bbl., 13.05@13.17½; lard, per 100 lbs, 6.97½; short ribs, sides (loose), 6.30@6.55; short clear sides, (boxed), 6.62½@6.75; clover, contract grade, 11.25.

CHICAGO, Jan. 12.—Cattle—Receipts, 17,000; steady to strong; good to prime steers, 5.00@5.70; poor to medium, 3.50@3.80; stockers and feeders, 2.50@4.00; cows, 1.50@4.25; heifers, 2.00@4.75; canners, 1.50@4.25; bulls, 2.00@4.75; calves, 1.50@2.30; Texas fed steers, 2.00@4.00; western steers, 5.00@6.50. Hogs—Receipts, today, 30.000; tomorrow, 35,000; 10c to 15c higher; mixed and butchers' 4.60@4.85; rough heavy, 4.65@4.95; light, 4.40@4.85; bulk of sales, 4.75@4.95. Sheep—Receipts, 18,000; sheep and lambs steady; good to choice wethers, 4.25@4.60; fair to choice mixed, 3.00@4.00; western sheep, 3.00@4.40; native lambs, 4.50@6.30; western lambs, 4.75@6.25.

DAIRY MARKET.

On the Produce Exchange today the butter market was steady; creamery, 15@21; dairy, 18@19; eggs steady, 25@27; cheese, steady, 10@10½.

California Dried Fruits.

NEW YORK, Jan. 20.—The market for evaporated apples is quiet under a light demand, with the general undertone rather favoring buyers. Common are quoted at 4@5c; prime, 5½@5¾c; choice, 5½@6c; fancy, 6¼@7c. Prunes are rather easy here, but coast advices indicate firmness among primary holders and a tendency to sustain local quotations that range from 3½@6½, according to grade. Apricots are quiet; choice are quoted at 9¼@9½c; extra choice, 9¾@10¼c; and fancy, 11@15c. Peaches are steady, with choice held at 7¼@7¾c; extra choice, 7¾@8c, and fancy 9@10c.

New York General Market.

NEW YORK, Jan. 21.—Wheat, spot, firm; options closed ¾ to 1¼c above Tuesday; May closed 93¾c; July closed 89c. Hops firm. Hides firm. Wool firm. Petroleum, steady. Coffee, spot firm; No. 7 invoice, 8 1-16c; mild steady. Sugar, raw nominal; refined dull.

CITRUS MARKETS

THE ORANGE MARKET.

The weather has proved a serious obstacle to active trading in oranges at eastern auction points. Zero weather of this week, so far resulted in practically postponing, up to Wednesday, orange sales from California. Florida oranges were sold, to some extent, but the demand for them did not amount to much only a few hundred boxes being sold daily. On Wednesday seventeen cars were sold at auction. extra fancy Thompson's Navels bringing $2.75@2.10; average $2.34; Washington Navels, $2.45@1.70; average, $2.40.

THE LEMON MARKET.

The lemon market maintained fair activity, sustaining itself better than the orange market.

GO TO GARDENA

Gardena is located in the center of the broad fertile valley between Los Angeles and San Pedro; has two electric lines giving the very best facilities for marketing products.

It is without rival in regard to climate, soil and water supply.

The soil is adapted to berries, alfalfa, vegetables, walnuts, etc.

For Sale, 10 Acres, $4500

House of 6 rooms, barn, farming tools, hay in barn, 1 horse, chickens, etc. One acre in alfalfa, balance in orchard, mostly apricots. $2,000 cash, 6%, good time.

5 Acres, $2,000

Three acres young strawberries; balance alfalfa and garden. Horse, cow, buggy and farming implements.

5 Acres, $1,400

Two and one-half acres new strawberries,

20 Acres, $2500

One acre strawberries, 3 acres apple orchard; 7-room house; barn. Easy terms.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, sheds, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house and barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

W. M. GRAY
Gardena, Cal.

Coulson's Chick Food

Makes Chicks Grow

COULSON'S Growing Chick Food is a mixture of 14 different grains, seeds, meals, etc., such as oat meal, pea meal, rice, wheat, millet seed, hemp seed, flax seed, flax meal, fine bone meal, baked hearts and liver meal, animal charcoal, etc., proportioned so as to meet all the needs of growing chicks and to fully nourish them.

By the term "fully nourished" we mean a great deal. Common grain or chick foods, as a rule, contain too much fat-forming and not enough bone and muscle-forming elements, and in consequence, the chick develops indigestion and diarrhoea and soon dies, or is only partly nourished, leg weakness develops and the chick drags out a miserable existence.

If you will feed Coulson's Chick Food to the chicks they will be fully nourished and you will be relieved of these troubles. Coulson's Chick Food is a complete, properly balanced ration, all mixed, ready for feed. You feed it just as it is, wet or dry; mix nothing with it, as it contains all they require for the first eight or ten weeks.

Coulson's Chick Food is not very expensive. It is much cheaper to feed Coulson's Chick Food and raise big, strong chickens, than to feed by guess a little of this and a little of that, and not raise more than one-half of them. Remember Coulson's Chick Food contains everything required to fully nourish the chicks for the first eight weeks.

Coulson's Chick Food fills the bill perfectly and properly. The percentage of the constituting elements that enter into its composition is most admirably correct. The protein, carbonacious and nitrogenous matter that enter into it are compounded in such proportion so that the chicks can easily digest the food and get the full amount of nourishment from it.

Parties who have once used Coulson's Chick Food are satisfied that it makes the chicks grow, and that it is far better than ordinary food.

Coulson's Chick Food carries the chicks over the danger line and imparts to them growth and vigor.

NEARLY ONE HALF OF ALL THE CHICK FOOD SOLD AND IN USE IN CALIFORNIA IS COULSON'S CHICK FOOD. ALL THE TROUBLE IS CAUSED BY THE OTHER HALF.

The virtue of Coulson's Chick Food is spreading with amazing rapidity. Do not get away with the idea that Coulson's Chick Food is "expensive feeding." It is much cheaper than the ordinary way—far so.

What is the use of feeding your chicks on cheaper feed because it is cheaper? The chicks die and you have no feed nor value to show for it.

When the chicks die any kind of feed is expensive. In large broods the loss of food is quite an item and the loss of chicks quite discouraging.

Used With Success by the Largest Poultry Raisers in California

Coulson's Growing Chick Food

Makes Bone, Muscle, Meat and Feathers

It is better to spend a little more and get Coulson's' Chick Food and raise bigger, spryer and healthier chicks.

The root of all trouble in poultry culture is the death of the chicks. Have you ever stopped to think how many hundreds, perhaps thousands, of chickens you would have had if those fine hatches had not died off?

Nowadays no one has much trouble in hatching chicks, but the brooder makes short work of them. The fault may be due to the regulating or care of the brooder or it may be found in the laying stock from which you have secured the eggs. They may be out of condition. But the main cause is in the feeding. We do not say that if you feed Coulson's Chick Food that your chicks will not die. But we do say that if the chicks are fed on Coulson's Chick Food according to directions, they are rightly fed and if they die they died from some other cause.

In conclusion, we will say if you like to see little chicks dive into feed as though they like it; if you want to see little chicks always spry and healthy; if you want to have them grow rapidly and mature quickly, then you want to feed them the first two months on

COULSON'S CHICK FOOD.

and you will be pleased with the way your little chicks are growing. No bowel trouble, no leg weakness amongst the chicks, if they are raised on COULSON'S GROWING CHICK FOOD.

Coulson's Chick Foods will cost you more than some other foods, but Coulson's Chick Food will raise the finest and largest chicks.

We take great pains and carefulness in selecting the grains, seeds and meals to be used in preparing Coulson's Chick Food.

More than 200,000 pounds of Coulson's Chick Food sold last season, and about a million chicks were raised on Coulson's Chick Food.

C. H. Purvine, one of the most practical and experienced of Petaluma poultrymen, who has a large poultry farm and raises thousands of chicks, uses tons of Coulson's Chick Food with splendid success. To the last brood of 3400 chicks he fed 1 sack every day of Coulson's Chick Food and at the age of four weeks the chicks were big enough to go on the roost.

Mr. C. Garrazzi, who has a large poultry farm near Tomales, raises many thousands of chicks on Coulson's Chick Food. He uses tons of it and contracts for it by the carload.

Mr. W. S. Rose, of Antioch, Cal., who raises thoroughbreds, Barred Plymouth Rocks and White Minorcas that took the prize at the last San Francisco Show, has a rooster that was fed on Coulson's Chick Food and now weighs 14 pounds.

OAKLAND, Cal., Dec. 3, 1903.

I have used Coulson's Chick Food all last summer and found it highly satisfactory and would not be without it for raising little chicks. While feeding this feed I did not lose a single chick, and they grew so fast it was astonishing. DR. F. X. BODIN,

2102 Elm Street, Oakland, Cal.

We have hundreds of letters from poultrymen in all parts of California who have used Coulson's Chick Food with splendid success, and if you are going to raise any chicks this season we hope you will give Coulson's Chick Food a trial, for we know that you will be pleased with results.

It is evident from the many testimonials we receive that COULSON'S CHICK FOOD is a vast improvement over other foods. A. De Rezendes raised last year 6000 chicks on COULSON'S CHICK FOOD. He sold over 2000 broilers and he now has 1500 pullets just old enough to begin to lay. He has over 4000 growing chicks now that he is feeding COULSON'S CHICK FOOD and he will hatch out many thousands more in a short while. He buys Coulson's feed in car lots, in fact, we just shipped him a car of over 300 sacks a few days ago.

It Is Wonderful How It Makes Chicks Grow.

Fullerton, Cal., Oct. 24, 1903.
RIVERSIDE NURSERIES, Riverside, Cal.
Dear Sirs—It is with no small degree of pride that I point to the orange orchard that I set out in June, 1902, with stock from your nurseries. I am not acquainted with any orchard of similar age that has done so well, and is today so promising. This certainly speaks in no uncertain language of the character of the stock coming from your nurseries. Very respectfully,
CHARLES CHAPMAN.

CITRUS NURSERIES

Arlington Heights, Riverside, Cal., Dec. 1, 1903.
JAMES MILLS, ESQ.
Dear Sir—In reply to your inquiry regarding orange trees bought of you last Spring, I will say that they are very satisfactory. They are much larger and more vigorous than any out of town trees we bought last year. I have never seen any nursery stock to equal our best Riverside trees—and I have been planting for the last 24 years. Yours very truly,
C.A. CROSBY, Mgr. Alta Cresta Rancho

Ontario, Cal., Dec. 5, 1903.
MR JAMES MILLS, Riverside, Cal.
Dear Sir—The orange trees that I received from you last season were the most satisfactory that I have ever had, and have made a strong, vigorous growth. I have seldom seen trees make better heads, or look so thrifty in so short a period since planted. It certainly pays to buy good trees, cheap trees are the dearest in the long run.
Yours truly, A. T. HAMILTON.

Peach and Pear Grafting

BY JOHN ISAAC, SACRAMENTO

I have been asked by a subscriber at Loomis, California, to give some information regarding grafting peach and pear seedlings, and the methods of preparing the wax to be used in the work; also to give some information about transplanting peach and pear trees.

There are several methods of grafting seedling peach and pear, as well as other seedling trees, and the rules given will be found applicable to nearly all deciduous stock. Perhaps the simplest form is that known as whip grafting, and this form is more generally practiced in the grafting of young stock than any other. It is equally applicable to grafting in the nursery or on the bench. In the one case, the young stock is worked over where it stands in the rows, without removal, and in the other it is taken up, transferred to the shed and placed on the grafting bench where the work is done, after which it is transferred to the nursery rows. In the latter case the work is much easier than where the stock is grafted in the field, as it saves the wearying stoop which is so tiresome in field work. Work can be done in the shed, too, in all weathers, and for these reasons bench grafting is to be preferred.

In grafting seedling stock the young trees are cut off at the proper distance, which is usually close to the ground, with a sloping cut, about an inch in length. This cut should be made with a firm hand and without hesitancy, so that it is smooth and even through its whole length. Then, reversing the knife, start a cut about a fourth of an inch from the top of the first cut and split it down in the form of a tongue. The scion is then prepared in the same manner, but, of course, reversed. The scions should always have several healthy buds and correspond in size with the stock.

It is imperative that the cambium layer of both scion and stock come in contact on one side at least. This forms a continuous passage for the flow of sap between the two and an adhesion will soon take place which insures the future tree. This is one of the most important points in grafting; the next is to so cover the wound that all air shall be excluded. This is accomplished with grafting wax, which is applied to the point of union between the stock and the scion. If the air gains admission the graft dries and curls away from the stock and the operation is a failure.

The following illustration will give a good idea of the method of grafting above described.

* * *

The transplanting of the young trees in nursery rows after the grafting has been finished is a very simple operation, and consists of setting them in a trench which has been prepared for them, giving ample root room, for the roots should not be crowded, and setting them about twelve to eighteen inches apart in the rows. The rows should be about three feet apart. Of course, careful cultivation is required and they should be kept free from weeds. Care should be taken not to loosen the graft after it has been inserted and in working around the young stock this emergency must be carefully guarded against.

A. The scion. a. The sloping cut. b. The tongue. c. Shows thickness of tongue. B. The stock. d. The sloping cut in the stock. e. The tongue. f. Shows thickness of stock from the cut or tongue. C. The scion inserted, and ready for waxing.

The Black Fungus...

A correspondent from Santa Rosa writes that his pulm orchard is affected with honey dew, and his orchard is also troubled with prune scale. He asks for a formula to spray with and also a formula to spray his apple orchard for codling moth.

The black fungus or honey-dew of which you complain is not a disease of itself, but rather a symptom. It is caused by the scale which is found on the trees. Nearly if not quite all the coccid, or scale family exude a honey dew. The insects suck the sap from the trees on which they find lodgment and a continuous, but very fine shower of this sweet sticky substance is thrown off by them and falls to the leaves below. If the trees are very seriously attacked by the scale, this exudation may be so great as to cover the ground beneath the trees. Falling on the leaves, these become coated with it and this affords perfect conditions for the growth of the black fungus, which our correspondent describes. The remedy is to get rid of the scale. We have a very effective parasite of this prune scale, or, as it is more commonly known, the brown apricot scale, in the Comys fusca, a very small fly which lays its eggs inside the scale. These eggs hatch out small maggots which at once devour the eggs of the scale and thus reduce its numbers. Our correspondent should apply to Mr. Alexander Craw, Deputy Horticultural Commissioner, room 11, Ferry Building, San Francisco, for a colony of these parasites and he will send it in the season, which will be in May or June. It may take the parasite two or three years to overtake the scale but it will do it, and then the scale and black fungus will disappear together. Of course when the parasites are introduced there should be no more spraying done. If, however, our correspondent is anxious to get rid of the pest and does not wish to wait for the parasite to do the work he can use the following spray:

Rosin	30 pounds
Caustic soda (98%)	8 pounds
Fish oil	4½ pints
Water, to make	100 gallons

Place the rosin, caustic soda and fish oil in a large boiler, pour over them about 20 gallons of water, and cook thoroughly over a brisk fire for at least three hours; then add hot water, a little occasionally, and stir well, until you have not less than 50 gallons of hot solution. Place this in the spray tank, and add cold water to make the necessary amount. Never add cold water when cooking.

This may be used any time during the winter months, preferably as late as possible before the trees are in leaf.

* * *

For codling moth in apples, Paris green is the most effective remedy, really the only one to be recommended. It is used as follows:

Paris green (pure, or to contain at least 50% arsenious acid	1 pound
Fresh lime	6 pounds
Water	200 gallons

Use no ammonia or soap. Make the Paris green into a paste before placing into spray tank, and keep constantly stirred while spraying. Spray as soon as the blossoms drop, and before the fruit turns downward. A second application should be made about sixteen days after the first, and, where required, a third and even fourth application for late varieties, at three weeks intervals. To make the Paris green more insoluble, and thereby prevent injury to the leaves, dissolve six pounds of fresh lime in water, and, when the lime has settled, add the water to the solution and keep it constantly stirred.

RED SCALE IN FRANCE.

I. J. R. sends me a paper printed in French, with an article written in Nice, France, describing an insect that is doing much harm in that country. The writer contends that they have received this scourge from America. It is working great evil in the orange groves. He says it is the Chrysumphalus minor. From the description I am sure the insect is our common red scale. The correct name is Chrysomphalus (Aspidiotus) aurantii. We can readily believe that the insect is quite as bad as the writer asserts it to be. California orchardists need not be told that this is a grievous pest. I don't see, however, how the writer knows that they are indebted to America for this unwelcome scourge. We got it from somewhere, why not they from the same place, the native home of this pest? True, we may have given them this scale, but who can tell. If France is importing orange trees from America, with no care, then she may rightly conclude that introduction from here is not unlikely. France, America, all our civilized countries may well bestir themselves, and see that no insect pests are introduced into their country, and all should unite in searching out the native home of all such species, that we might also secure their natural parasites.

M. E. Ginn, of Redlands, has bought the beautiful Slocum place at Highland, above the asylum, and will set out 40 acres more to oranges.

ITEMS OF INTEREST.

The loss by the Baltimore fire has only been exceeded in this country by the Chicago fire which almost wiped out that city. The year 1904 does not augur well for the peace and prosperity of the world. Floods, fire, war, present a horoscope which the vision of the humanitarian would gladly pass over.

* * *

When the grain-grower, the fruit-raiser and the live-stock-man get together on the matter of freights there will be something doing. They will use a double track railway across the continent as an object lesson in trade ethics for the benefit of transportation trusts and then there will be lively guessing as to who are the lords of this "land of the free and the home of the brave."

* * *

Great movements in military affairs create a larger demand for horses and mules. There will be a revival in this kind of live stock industry and America leads the world in it. The electric and caloric auto-machines will never be able to supplant the horse in war movements. The horse will soon appear in the current market quotations of the great trade centers.

* * *

We have good reasons for saying with Charles Kingsley, "Welcome, wild, north-easter," if such wind brings to us the "rain on the roof," for "every tinkle on the shingles has an echo in the heart."

One can forgive the fellow who wrote the weather forecast, which predicted a horizontal line of dryness, as now in deep contrition, he wipes his eyes with an isothermal chart. The smiles here upon the faces of men are but a reflex of the face of nature.

* * *

From a view point of sentiment, it is a beautiful thought to adhere as nearly as practicable to the lines of the paths of padres, in the improvement of our public roads, but no farther than is consistent with strictest economy. In the restoration of El Camino Real, the utilitarian idea should predominate. Build by the most direct, on the easiest grades and as durable as the Appian Way. Enough of the traditional phases could be taken in to lend a charm and preserve the old land marks, some of which are "rock-ribbed and ancient as the sun."

* * *

In the world's work, no department is making greater progress than those who are engaged in the operative lines of rural life. The principles science enter into every recognized element involved and these elements as they are discovered are no longer to be classed as insurmountable impediments, if properly understood. The reclamation of arid lands by irrigation, the reforesting of the higher ranges, the conversion of alkaline wastes into fertile fields by drain tiling, the extermination of pests by entomological science, and the specializing of the different lines—grain growing, fruit culture, stock raising, and dairying, has done wonders in the development of farming as a business. There is no field so broad, so diversified, requiring such a wide range of knowledge of nature, as the farm. Farming, so-called has taken rank as one of the leading sciences. The day of the ridiculed "Ruben" and simple minded "Hayseed" has passed. Cincinnatus holds the handles of the plow and he is not looking backward.

* * *

Japan Forces the Issue—War between Russia and Japan is now a living reality and the worse for Russia. It has been apparent, for some time, that the issue would come but it was hardly anticipated that Japan would inauguate hostilities. It seems however ,that the plucky little empire is better prepared for war than Russia, not only in a physical sense but in the ideal sentiment of the people supporting the war movement. We may expect a long drawn out seige, for although Japan may be better prepared at the outset for war the recuperative resources of Russia are so ample as to leave no question of the ability of the Empire to conduct hostilities on a prolonged basis.

* * *

Senator Bards' Irrigation Bill.—A bill of much interest will shortly be introduced in the Senate by Mr. Bard, of this State, which is of great moment to the people of California. It is a bill authorizing the California Development Company to divert the waters of the Colorado river for what is known as the Imperial country. In fact this water has already been taken from the Colorado river, and the bill is merely for the purpose of obtaining Congressional sanction to what is already being done.

The promoters of this proposition as well as those having invested in lands in the country are vitally interested in obtaining the sanction of Congress to the bill, for if it should be denied it would create complications which might prove serious to all concerned. Under the influence of irrigation there are in the Imperial district, 30,000 acres in barley and wheat and almost 75,000 acres in alfalfa corn and millet. Where two years ago not a person was living on the land, today producing such marvelous results, there is an estimated population of between 6000 and 9000 permanent population. Land bought from the Government twenty-six months ago at $1.25 per acre, on which $8.75 per acre has since been paid for water and about $5 per acre spent for leveling, is now worth, according to the latest sales recorded, $42.50 per acre. Borings made at the town of Imperial for a depth of 600 feet show that the whole floor of the desert is nothing but river silt.

"The Imperial district, says the San Francisco Chronicle, is really one of most remarkable examples of arid land reclamation by private enterprise on the continent. The belt already reclaimed is at least thirty miles long and six miles wide, all of which is bearing luxuriant crops. The transformation which irrigation has thus produced is in marvelous contrast with the arid waste in its immediate neighborhood, of which it was so recently a part. No better evidence could be obtained, in fact, than that which the Imperial district is giving of the wisdom of the Government's policy toward the arid lands of the country."

* * *

Developing Citrus Fruits.—The Department of Agriculture is making much progress in the matter of developing citrus fruits. Dr. Herbert J. Webber, of the department, has introduced what he calls a tangelo, which is a hybrid fruit obtained by crossing a tangerine or kid-glove orange with the pomelo, or grape fruit. This was suggested to Dr. Webber by the great difficulty in eating grapefruit with a spoon. The tangelo does away with this objection.

Dr. Webber pronounces the tangelo about the best fruit known. Experiments have been so successful that it will soon be put on a commercial basis. Already many growers are beginning to utilize the discovery of the department, and are now working to secure the tangelo. Practically the same methods have been used in securing the tangerine orange by crossing the tangerine with Florida oranges. A fruit larger than the ordinary orange is secured, and there is no difficulty now experienced in removing the skin from the pulp.

* * *

Farmers' National Exchange—The farmers of the Mississippi valley will meet in convention at Omaha on March 1, to organize a national exchange with a capital of fifty million dollars. The idea is to form a co-operative association to handle grain, live stock, lumber and coal, and to erect elevators and brick warehouses at convenient points to care for these commodities when the market will not permit of their immediate disposition.

This is no new suggestion. For over a year the matter has been under discussion, and it has taken form more particularly, since the owners of packing houses have treated the cattle men of the country in the unfair manner they have, as exhibited in the prices paid for beef to slaughter at their packing houses. The great live stock convention at Portland, some weeks since, started the movement by providing ways and means to build packing plants at terminal points like Chicago, St. Louis, Kansas City, Omaha, San Francisco and Los Angeles.

The time is ripe for just such a movement as the farmers are contemplating in this action. They have been preyed upon by the packing houses of the country until the cattle raising business and nearly all other large institutions have been snorn of their profits. Grain speculators, coal operators and even fruit commission firms have been all unfairly dealing with the farmers and producers, until the profits of their industries have gone to swell the emoluments of the trusts, to the lasting injury of the agriculturalists. It is time to change front. It is time for the farmers to begin a campaign for self protection. They have too long been dominated by those who will destroy them. Co-operation is the remedy and the most potent remedy to correct the evils of which they complain. If this movement should result as its promoters anticipate it will, the day of the trust tyrant in the dictation of prices it at an end. Farmers will receive what their commodities are worth, not what corporation managers are pleased to grant them. The law of supply and demand will govern, and under its operation prices will be measured and results achieved which will be just, if not always as satisfactory as could be desired.

* * *

Cattle Must Be Dipped.—The question of moving cattle from Southern California into other States and Territories over the quarantine line has been under discussion between the authorities of this State, Arizona, and Washington for some time. Of course the necessity will come from protracted drought, should that occur to the extent of the fears recently anticipated in this part of California. Secretary Wilson has informed Governor Pardee, that he will modify his ruling so that cattle may be moved to other States if they should be dipped in Beaumont (Texas) crude oil according to regulations. The Governor of Arizona has the matter under advisement and a speedy decision is expected.

EASTERN PEACHES KILLED.

Severe weather in the east is reported to have killed not only the coming crop, but many trees. These reports come from reliable authorities in several different States and tell of damage to plum and cherry trees as well as to peach trees. Reports from Georgia, Delaware and Michigan are more hopeful, although Delaware growers fear that damage has been done.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

DISCONTENT OF THE OUTS.

Friends of co-operation, and especially those who believe in the distributive control of our citrus fruits through one responsible head, must be aware of the frantic efforts now being made by those who have been frozen out for cause, to disorganize the forces which now control the fruit of Southern California. Appeals are being made to prejudice against a combination of farm interests as if it were not acknowledged by all that the farmers must organize to resist the aggression of forces that would otherwise monopolize the markets of the country to the detriment of the producer. These appeals do not stop at playing upon prejudice. They utilize every adverse market condition whether of weather or poor condition of the fruit. They distort facts, magnify misfortunes, place false conclusions and sometimes deliberately falsify conditions in order to get in a little deeper upon the ragged edge of a great business. Formerly these malcontents operated from the center and were most potent in their influence upon the movement of citrus fruits. The Cultivator has never put forth a criticism upon any responsible, helpful business enterprise. Yet, it has always been in opposition to every factor that has not earned the right to a share in the profits of farm produce by rendering some service in the distribution of such produce that could not be performed by the farmers themselves. This position is unassailable and, fortunately, its adherents are largely in the majority in more than a half dozen agricultural industries of the State. It would be useless to reiterate the fundamental priciples upon which co-operative policies rest were it not for the fact that the ostracized, unearning factors formerly operating in fruit are continually attempting to confuse the situation and tear down the organizations built to resist the inroads of the irresponsibles.

A WASTE OF GUNPOWDER.

An effort is being made to get the supervisors of Tulare county to appropriate $250 for the purpose of firing gunpowder at the blue sky, in order to make it rain. Now, if the result desired could only be brought about in this manner, the price would be dirt cheap, but the results are so extremely doubtful that were we a supervisor of Tulare county, we should hesitate long about spending the people's money upon any such proposition. Rainstorms, such as are worth anything in California, are not mere local affairs to be influenced by a cannonading, but are very elaborate matters extending over thousands of square miles, and having their origin far out on the Pacific ocean. That these can be influenced by discharging a popgun at them is a most ridiculous notion, and one which we tie ever influenced the rainfall. It is even a matter of doubt, in spite of the oft made assertion to that effect, whether the bombarding in a big battle ever influenced the rainfall. It is true that heavy storms have fallen after battles, but these always occurred where it generally rains several times a week, and is always ready to do so with or without provocation. In fact, all that was necessary in many instances was for the belligerents to prepare, and it would rain before a shot was fired, as instance, the battle of Waterloo. California is too dry a State to be influenced to rain by any artificial means whatever.

CITRUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

TROPICAL FRUITS FOR THE HOME.

Editor Cultivator: Have you or any of your readers in Southern California hand any experience with the new varieties of loquats, such as Premier, Pineapple, Advance, etc., and the new sweet varieties of pomegranates? I know of none of these varieties in bearing in this section.

Also, for family use, what varieties of oranges and pomelos would you advise for this section? Also, what varieties of olives are best for family orchard for ripe pickles and oil? Will olives bear better when two or more varieties are planted alternately?—H. G. Keesling, Edenvale, Cal.

We have had no experience with bearing loquats of the above varieties except the Advance. This variety has borne with us for several years. It is very large, a little smaller than a hen's egg, of good quality and a light amber color when ripe. We have two varieties that the Department of Agriculture at Washington, D. C., sent to the Pomona station. They have just begun to bloom. Two varieties of pomegranates were received last spring, and, of course, are not yet in bearing. We have two very good sweet sorts that have been bearing for seven or eight years. They are Spanish Ruby and Sweet Spanish. The latter is very large and later than Spanish Ruby. Both are of fine quality. Mr. C. P. Taft, of Tustin Orange county, has a tropical situation in which he grows all sorts of exotic fruits, and he may be able to enlighten you on these subjects.

We would suggest that you try the Washington Navel, Parson Brown and Valencia Late oranges. St. Michael is a very fine late variety, smooth and firm as a well-grown lemon. Marsh's Seedless Pomelo is the best on the market. It is of good flavor, practically seedless and consequently agreeable and convenient to eat.

There is no olive that will fill the bill better for oil and pickles, than the Old Mission olive. It sells in the southern market when the other varieties are either a drug on the market or are spoiled. There are several larger varieties that are excellent when first cured, but they are difficult to keep and packers are afraid to risk them. Sevaliano is the largest olive grown, and is usually pickled green. Ascolano is another that is used the same way. These two are the best of the large kinds, being the largest and having firmer flesh than any of the other large kinds. Santa Caterina is an excellent medium-sized variety, averaging about the size of a good Mission olive. It is heart-shaped and light amber color when first turning, and makes a good pickle. But is not as good a keeper as Mission.

Olives bear better when varieties are mixed in the orchard, and it is important that the rows containing one variety run crosswise with the direction from which the prevailing spring winds blow, though bees are important factors in cross pollination of the olive. It is true that olive trees, and especially the Mission, have been known to bear almost regularly, even when single trees were isolated. The safest plan is to have them mixed with other varieties. Rubra is a good variety to plant with Mission. Santa Catrina is another.

* * *

GRAFTING OLIVES.

Editor Cultivator: I have about 200 olive trees, from 4 to 8 years old, that I want to graft or bud with a different kind. Please let me know what is meant by machine grafting, and how it is done. Do you think that bark grafting is better than splitting the stub, and do you think it too severe to cut the whole top of an olive off at once, or is it better to graft or bud half this year and the other half next year?

A great many olives of a poor variety have been planted in this vicinity and a good many growers are anxious to change them.—J. E. Rutherford, Wyandotte, Calif.

By machine grafting we mean grafting when the cuts are made by a mechanical contrivance. The construction of the implement is simple. One part is made with two steel knife blades welded together, so as to form an angle of about 15 degrees. This is brazed onto a piece of steel heavy enough so that it may be struck on the back with a hammer and not be injured. After the branch is sawed off, the implement is placed with the wide part of the angle just above the end of the stump. This makes the instrument in line with the limb that is being grafted. It is struck with a hammer, so as to cut into the bark and sapwood to a depth of about a quarter of an inch. The whole thing is then forced up, which takes out a wedge-shaped piece of wood and bark. Another implement, made in the shape of a pair of pinchers, which cuts the end of a scion at the same angle as the wedge-shaped piece that is removed, will make the work rapid and accurate. We have seen grafts put into large branches by this method in May, and a good stand was secured without the use of wax. This is not advisable, as wax insures a better stand of grafts. The cambium layer of the stock and scion should be matched.

It is best to remove the entire top of the tree at one time, and start the whole new top at once. It does not injure the tree and makes a better job. The idea that removing part of the tree at one time is better than taking all the top off at once, is erroneous. It is the second removal within a year or so that taxes the vitality of a tree. The grafting should be done when the sap is running rapidly. It may be continued well into May and even later.

REMARKABLE YEAR FOR FRUIT.

Horticultural Commissioner Cundiff of Riverside County has just completed his report for the year, which has much of interest in it. He is enthusiastic over the fact that both citrus and deciduous fruit has turned out better than anticipated. The following figures taken from his report show what has been done in various lines of fruit and vegetable culture. During the past three years Coachella shipped 97 car loads of grapes and melons, Banning sent out 1000 tons of cured fruit, 16 cars of egg plums and 25 tons of almonds and walnuts. San Jacinto sent to market 700 tons of canned and 1350 tons of cured fruit; Hemet and Valle Vista had 100 tons of dried apricots and peaches. The total grain production of the county amounted to 500,000 sacks. There were 5000 cars of oranges and lemons from Riverside; 934 cars from Corona; 50 cars from Moreno and 19 cars from Hemet and Valle Vista. He shows that 8368 acres of orchard have been inspected, and over 3000 acres sprayed with distillate emulsion at the expense of the owners. Fumigation for red scale, spraying for blackscale, and whale oil soap emulsion for brown scale were the methods of treating the orchards.

A HARDY ORANGE.

If we are to rely on Washington dispatches a somewhat reliable orange has been produced by A. F. Woods, the vegetable pathologist and physiologist of the Department of Agriculture. The orange is desirable for the reason that it is hardy enough to resist frost and cold weather. The drawback to the fruit is its acid character, being more sour, it is claimed, than the lemon. The promoter of this orange has been trying for some years to hybridize an orange tree that will withstand the killing frosts and he seems to have succeeded except as to the acid nature of the fruit. He thinks, however, that this drawback to the commercial value of the orange may, in time, be overcome by crossing with best varieties of the sweet orange.

The Riverside Press states: The Western Orchards Produce company that shipped twenty-seven cars of Riverside navels to England this season, has just received word that the first shipment has reached its destination and the fruit is in first-class condition.

The rains are booming planting in the San Jose valley, and all nurserymen are crowded with orders for fruit trees.

ROEDING TRUE TREES FRESNO, CAL.

THE FIRST COST OF A TREE IS A MINOR MATTER

Trees and Vines

Of All Sorts For Sale

Our stock of all varieties is large, thrifty and very uniform. We exercise great care, not only in growing, but in handling our trees in the nursery, salesyard and packing house, which insures planters the best stock. True to name. Large illustrated General Nursery Catalogue mailed for 5c postage.

Fancher Creek Nurseries

Incorporated

(Paid Up Capital, $200,000 00.)

BOX 14 FRESNO, CALIFORNIA

Growers should plant

CALIMYRNA Fig Trees

Because it has been demonstrated that they are a commercial success. Because this is the only fig that is fit for commercial purposes. The truth about this great fig industry can be found in a book entitled "The Smyrna Fig at Home and Abroad," by Geo. C. Roeding. Eighty-seven pages, fully illustrated. Sent postpaid for 25c. Mr. Roeding has the only bearing Calimyrna fig orchard in the U. S. Sample box of dried figs (the product of this orchard) can be had upon receipt of 20c postage.

BE SURE SEAL SHOWN HERE IS ON YOUR TREES

CALIMYRNA R FRESNO

Fine Orange Trees

NAVELS

VALENCIAS

Strong, thrifty growing trees, absolutely true to name.

Mr. H. D. Blanchard, Covina. Covina, Jan. 1, '04.

Dear Sir—Regarding the orange trees purchased of you last spring I wish to say that after a summer's growth I can commend the stock most heartily, for the growth has borne out to the fullest the promise of the fine-looking stock which I bought. I will be pleased to show these teees to any one who will call. G. B. SMEE.

More and better trees for sale this year at a very low price.

COVINA NURSERIES - COVINA, CAL.

MAYWOOD COLONY NURSERY

W. HERBERT SAMSON, PROP.

We have for sale all leading varieties of Deciduous Fruit Trees

OUR SPECIALTY:

Lob Ingir or Genuine Smyrna Fig of Commerce

A WORD ABOUT FIGS: We sell the genuine Fig of Commerce. Our cuttings came from bearing trees in the orchard of the Stanford estate, near Vina, and the fruit from these trees, after being examined by the best fig experts of the State, is pronounced the genuine Fig of Commerce, the Lob Ingir. Dr. Eisen says this and no other variety should be known as Smyrna, if the name Smyrna is to be used at all. We can refer prospective purchasers to the Supt. of the Stanford ranch, at Vina, for a verification of this statement. As to my own reliability, I can refer parties to any of the leading merchants of Corning, and to the Bank of Tehama County, and the Herbert Kraft Co. Bank, at Red Bluff, Cal. No one in the Unites States originated the Commercial Smyrna Fig. It is a variety which has been grown in Asia Minor for thousands of years. Parties may originate a fancy name and copyright it, but this does not make the fig they sell under a copyrighted name, any better. The fig we sell does not require a high sounding name to make it appear as the only commercial fig. All that we claim for our fig is that it is known as the Lob Ingir, the cuttings of which came originally from the famous orchards of Smyrna, Asia Minor, and is of the variety so largely imported into the United States in the dried state. We are not charging you for a private copyrighted name, but we sell you good 2 to 4 foot trees of the Genuine Smyrna Fig of Commerce at $150 per M. To fully demonstrate the methods used by some nurserymen in giving old varieties of fruit trees a new name and thereby make it appear that they have the only genuine article, we will say, how ridiculous it would be if we copyrighted a name like "Muro" and sold the old variety of Muir Peach under this name. Do not be misled by copyrighted names. We have the genuine Smyrna Fig of Commerce and if you want to confirm our statement, we do not hesitate to refer you to the above named parties. We can supply prospective planters a small sample of our dried figs for comparison with the so-called copyrighted figs. We also have for sale all varieties of Capri Fig trees, and all of our customers will be supplied at the proper time with a colony of Fig Wasps, free of cost. Address

W. Herbert Samson, Prop., Corning, Tehama Co., Cal.

Conducted by PROF. A. J. COOK, Claremont, Cal.

BEE KEEPING.

(Concluded.)

The Hive.—To start right is most desirable. The greatest need in starting is to secure a good hive.

A good hive will permit the bee-keeper to thoroughly examine his bees at will and to inspect every part of the hive. This can be done with no danger of stings; and it is necessary to the best success and to the best pleasure and the opposite makes the bees a menace to the public. Thus box-hives, such as were used in the olden times, are really a nuisance, and may and should be so declared by the best moral sentiment, if not by law. Else that worst disease known to bees, "foul brood," may come and work fearful havoc and no one know ought of it. No box hive should be tolerated in any bee keeping community. Only the "Moveable Comb Hive" should ever be used

* * *

THE BEST HIVE.

I have no hestitation in commending and recommending most emphatically the "Eight Frame Langstroth Hive" as decidedly the best for the beginning bee-keeper. This is the oldest of the improved hives, and is by far the most in use by the most advanced bee-keepers of all the improved hives. The very fact that it has held its own is proof that it is one of the best, if not the very best hive in use. Again, the beekeeper will wish occasionally to sell or buy more colonies of bees. In such case he will be able to buy or sell more advantageously if his hive is the hive most in use. No bee-keeper can ever afford two kinds of hives in his aviary. It would be a great gain to the beekeepers of the country if all could be persuaded to use the same kind of hives. The beginner then will make no mistake in procuring the Langstroth Frame hive.

It is always best to buy the hive of some reputable dealer. The hive must be very accurately made, as a misfit is a great nuisance. It will usually be cheaper to purchase, and there are usually dealers near by in every bee-keeping locality. I would have the hives painted for looks, as except for looks it will not pay to paint.

* * *

Wild Bees.—By this term I refer to others than hive bees. Bees are usually more hairy than are wasps. They always use pollen to feed the young and have broad hind legs, on the outside of which they store the pollen, that it may be carried to the nest. This wide, smooth hind leg is the mark that enables us to distinguish the bees from the wasps. The hind legs of the latter are slim and usually hairy. Most bees are solitary and live in similar nests to those of wasps; as in earthen tunnels, hollow stems, borings in wood, etc. Thus we have mason bees and boring bees. These carpenter bees are not rare here in California. If they bore into our houses, as is not uncommon, a mixture of kerosene and lard pushed into their tunnels, will quickly smother them. The tailor bees often cut the circular and oval pieces from the rose leaves and rose petals with which to fashion their paper cells. In these they store their pollen and lay the egg, and close all that the larva may be safe and well fed during all its babyhood.

The bumble bees are social and have very long tongues and so are very useful to pollinate red clover and other long tubed flowers. These bees are like the honey bees and the wasps in having a queen that lays all the eggs, the drones or males that do no work, and the workers. These latter die off in the fall and the queen, probably the young queens, alone survive the winter. In the spring she does all the work for a season till the workers are reared, when they do the gathering and nursing and she is limited to egg-laying. We thus understand why we see only large bumble bees in the early spring, and only smaller ones later in the year.

It is a well known fact that the first crop of red clover does not seed well in the east. The reason is evident. The deep flower tubes are too long for many insects and the bumble bees are necessary. The few queens are insufficient, and so for seed we must wait for the second crop, when the more numerous workers can properly pollinate the flowers, and a good crop of seed is secured. It will be remembered in this connection, that when red clover was taken to New Zealand there were no bumble bees there and it was found that the clover did not seed. Bumble bees were secured and abundant seed was then raised. The first crop of alfalfa seeds well, as the honey bee can pollinate that, and there are always plenty of honey bees for such work.

* * *

THE LINNET AND THE BEES.

Mr. R. B. Herron, of San Bernardino county, writes me that the fruit men are contemplating putting out poisoned water to kill the linnets to save their apricots. He fears that this would poison the bees and is considering an action at law against any who may do so. He asks my opinion. I urge that the linnets are a serious pest and should be killed. But I further urge the self-evident truth that no right-minded man would think or consent for a moment to do this if in so doing he would injure the property of another. I suggest that a meeting be called for conference, and promise to be present, if such action is taken. Mr. Mills, of the Ontario Experiment Station, tried this method to fight the linnet pest, and succeeded. He recommends it to others. He certainly would not do so if he had the least idea that harm to any one would come of it. Mr. Mills is also too cautious and able an observer to advise without good reasons. Bees are directed in their quests by odor. Water has very little or no scent. Is it not possible that water hung in trees would be found by the linnets, quaffed, and its work done before the bees had found it at all? Knowing the habits of bees as I do, I should expect just this. It would be easy for Mr. Herron to determine this and so help bee men and fruit men alike. This and the conference would be most wise, and worth more than the cost. I have great hopes that this method can be used and no harm done to any body.

* * *

DECAYED FRUIT AND BEES.

A. B. Judson, Escondido, wishes to know if it will injure his bees to work on decaying pears. Even when ripe they seem to prefer the decayed fruit to the sound. If not injurious is it nutritious? "I have your beekeeper's guide, but find no mention of this." In California I should fear no harm. As I mention in my book cider is thought to be harmful in case of long winters, where bees are confined a long time to the hives. Without doubt the bees do get some nourishment from the fruit. If it were easy, I should prefer to keep the bees from such food, but here I should take very little trouble in the matter. The very fact that bees are eager for such food, when they can get no nectar from the flowers and are always after it as opportunity offers, and yet suffer no harm, is evidence enough that we need not worry about it. It seems that there must be some element of the decay that meets a need of the bees.

* * *

POLLINATION AND FERTILIZATION.

Subscriber, Monrovia, wishes to know if these two terms mean the same thing. They do not. Pollination refers to the transfer of pollen from the anther of the stamen to the stigma of the pistil. Often for seed production this pollen must come from a different flower than the one that is to receive it. In this case the wind or more generally insects, must be present to carry the pollen or there will be no seed produced. Pollen must be on the stigma, or there never will be any seeds developed from the ovules. After the pollen grain is on the stigma, a tube grows from it and pushes down to the ovule and fertilizes it. Pollination is necessary to fertilization, and must precede it. Fertilization and so pollination is necessary to seed development, and usually to the production of fruit. The Navel orange develops without seed. Imperfect fertilization often results in deformed or imperfect fruit. We see this illustrated in the imperfect strawberries, which are not uncommon. As each strawberry has many seeds, so many fertilizations are necessary, and if some are omitted then we will secure deformed strawberries.

* * *

INFLUENCE OF FOGS.

Miss E. A. Ward, Carpenteria, wishes to know if she is correct in the opinion that fogs do not contribute to the moisture of the growing beans, but only aid by preventing "transpiration." She is wholly correct. The plant gets all of its moisture from the soil and much of this goes to the leaves and passes off by transpiration or evaporation. The amount of moisture that passes off in this way is almost beyond belief. Tons of water pass from our orchards every day in the growing season. Our dry atmosphere favors this escape of moisture. If then, there is a scarcity of moisture in the soil, as there is apt to be in case of irrigated plants, any thing that lessens this transpiration is of great benefit to the plants. The fogs tend greatly to restrain evaporation, or transpiration, as the scientist calls it, and the plants are materially benefited. The fogs then aid the plants by conserving the moisture, and not by directly giving them of their water. Much of the vegetation of arid regions looks to the saving of the water by restricting the amount of leaf surface. Thus we have the limited chlorophyll surface of such plants as the yucca, cactus, and century plants.

* * *

LOCUSTS.

H. E. Belfield, Norwalk, wishes to know if the finding of two locusts in his garden should arouse anxiety. Do these suggest the probability of a plague the coming season? Mr. B. need feel no alarm at all. It is always possible to find locusts at this season. I use locusts for my class work, and always find it easy to secure fine large specimens, each season, in late winter and early spring.

* * *

ORANGE APHIDS.

Mr. Thomas Stone, of Pasadena, sends citrus leaves with insects, which arouse his curiosity. He asks if they mean harm. These are the orange plant lice and are on the citrus trees more or less each season. A parasite, a Braconid fly, holds them in check so that they do little damage. This dry weather favors red mites, thrips and these aphids. We have more than one reason for hoping that a good down pour will come and give the greatly needed relief.

* * *

PASSION VINE CATERPILLAR.

I receive through Mr. Mills, from Mr. Bonine, Lamanda Park, the inquiry, "Will all varieties of Grandilla suffer from the caterpillar of the Passion vine butterfly?" I have experience with only the two common ones, the blue and the red. These both suffer, and I presume others would. Will any that have experience give the facts?

Redlands Nurseries

A complete line of **DECIDUOUS TREES**, consisting of Apricots—Royal, Blenheim, Newcastle's Early and Moorpark—and a full assortment of Peach, Plum, Prune, Pear, Nectarine, etc. In short, everything in the Deciduous line. We can offer the best **CITRUS TREES** to the planter that are on the market, free from scale and true to name, as we grow all our trees ourselves and you are not paying a middleman. When buying, buy of us and get good trees that will grow. Our stock of Deciduous Trees are as good as any and better than many and cheaper than all others. Write us for prices.

F. H. WILSON - FRESNO, CALIFORNIA

BY J. W. MILLS, ONTARIO, CAL.

SAN JOSE SCALE.

Editor Cultivator: Will you please publish in the Cultivator a brief history of the San Jose scale, the most effective spray, how to make it and how to apply.—J. G. Whitney, Los Gatos.

The San Jose scale was first noticed in California by fruit growers at San Jose in 1880. It was recently discovered that the original home of this insect is in China to the south of the great wall. It was imported into California some time previous to 1880. Until the lime, sulphur and salt wash was discovered, it was considered the worst enemy of the deciduous fruit grower.

This wash is made by boiling about 20 pounds of sulphur and 20 pounds of freshly slacked lime in about 30 gallons of water for an hour and a half. This will thoroughly dissolve the sulphur, if the best grade of sublimed sulphur is used. Then add two pounds more of freshly slacked lime and 15 pounds of stock salt and boil for half an hour longer. When spraying for San Jose scale, make this quantity up to sixty (60) gallons and spray either hot or cold. When a large quantity of this material is used, it will pay to fit up some barrels and cook it with steam which may be conveyed into the barrels by pipes coming down from above and connected with a boiler. The steam pipe may run overhead and directly over each barrel. Pipes are brought down into the open tops of the barrels so that the lower ends will come to within a few inches of the bottoms. When the barrels are filled up with the stuff and the steam is turned on, it will cook from the bottom up.

When the scale has attacked but a few trees in an orchard, it is well to mark them and spray them before the main orchard is begun. When the whole orchard is sprayed, give these trees another dose.

It is a good idea to add about six (6) pounds of blue stone to each sixty gallons of the spray. This will destroy a great many spores that will otherwise do much damage.

* * *

PECANS FOR STREET TREES.

Editor Cultivator: I am in search of information in regard to pecans I have seen in Los Angeles in a confectioner's window. There were a quantity of whole pecan kernels. It has been my experience that but few perfect kernels may be taken from the nuts. Are there varieties from which the kernels may be easily extracted?

Some eastern catalogues recommend the pecan for a street tree. What do you think of it? Please let me know if you know of bearing pecan trees which have nuts from which the kernels are easily extracted.—W. T. C., Riverside, Cal.

There are a number of varieties of pecans whose nuts produce whole meats. In Texas and Louisiana there are large establishments which turn out tons of them every year. They have a special machine which squeezes the nut endwise. The nuts are sorted into sizes and the machine is adjusted to suit the different sizes. Dr. Wm. R. Taylor, of Washington, D. C., can give information on the best varieties of pecans. He recommends Stuart as one of the best. This is a nut that Mr. W. R. Stuart, of Ocean Springs., Miss, secured after much trouble and expense. It is described as a "good cracker," good quality, with plump kernel. The nuts of this variety run about 25 to the pound. The parent tree of this variety was located in the swamps by steamboat captains, who purchased all sorts of nuts from people who brought them in, the project being engineered by Mr. Stuart. Dr. Taylor is now preparing a bulletin on the pecan and we assure our readers that it will contain interesting accounts and much valuable information on the pecan.

The pecan makes an excellent street tree. There is one growing in a side street about a block west of the Riverside city park. The tree is about sixteen years old and has a diameter of about 18 inches and is fully 40 feet high. The owner is very proud of it and thinks it is an excellent street tree.

* * *

PLUM ROOTS IN WATER.

Editor Cultivator: Will you please tell me whether peach roots budded on Myrobalan roots will grow on sandy land where the water raises within a foot or a foot and a half of the surface for about two months, June and July? The water gradually falls until at this time of the year the water is four feet lower. Will you also tell me whether black bass will do well in standing water which is nine feet deep and covers six or seven acres? The flow is all underground. Where can I get some of this kind of fish?—R. Wells, Selma.

We would not recommend planting stone fruit on the land which you describe. The rise of water comes at the wrong time of year. Pears and quinces may do well on that land; at any rate they will thrive better than stone fruit trees. We have seen old pear trees standing in snow water from before they came into bloom until the fruit was half grown and thrive. These trees, however, grew up under different conditions though the roots were always either in or very close to the water.

It is our opinion that black bass would live in the pond you describe, but for definite information you had better write to the State Fish Commissioners. They can also inform you where the fish may be obtained.

* * *

WHITE MULBERRY.

Editor Cultivator: Can you tell me where I could find "white mulberry" trees for silk culture? I was told that by writing to the Department of Agriculture I could get some.—E. Schneider, Westminster, Cal.

Any of the seedmen or nurserymen advertising in this paper will furnish you with trees or cuttings of the white mulberry. If you insist on being given the true Morus Alba (the white mulberry) you will get what you want.

* * *

TROT OUT YOUR GRAPE VINES.

Mr. J. M. Robinson, of Moorpark, Ventura county, says some one in Riverside mentioned that he was growing Cornichon grapes, and Mr. Robinson wants his address, as he wants a quantity of cuttings of that variety. We cannot find this item, so if the gentleman will drop us a card, and save his cuttings, he will help himself and another man.

TO PREVENT WALNUT BLIGHT.

The United States Department of Agriculture has sent out a bulletin, or rather, made some recommendations relative to the prevention of walnut blight. In this bulletin it is suggested that all infected trees shall be pruned closely. Cut away the diseased parts and the limbs which show the blackened scars of the past year's disease. In brief remove all traces, so far as possible, of the disease and burn all cuttings.

Spray the dormant trees thoroughly with bordeaux mixture two weeks before spring growth begins. All portions of the tree should be treated. Spray again as soon as the nuts are firmly set.

Use the following formula: Five pounds copper sulphate, five pounds good quicklime, fifty gallons water. Slake the lime in an oak barrel and add enough water to make twenty-five gallons milk of lime. Thoroughly dissolve the copper sulphate in an oak barrel containing twenty-five gallons cold water. Continue to pour one pailful each of milk of lime and copper sulphate solution simultaneously into a third oak barrel, holding fifty or sixty gallons, until all of the solutions are thus united. Stir the milk of lime as it is dipped out and pour it through a fine wire strainer into the mixing barrel. Use while fresh.

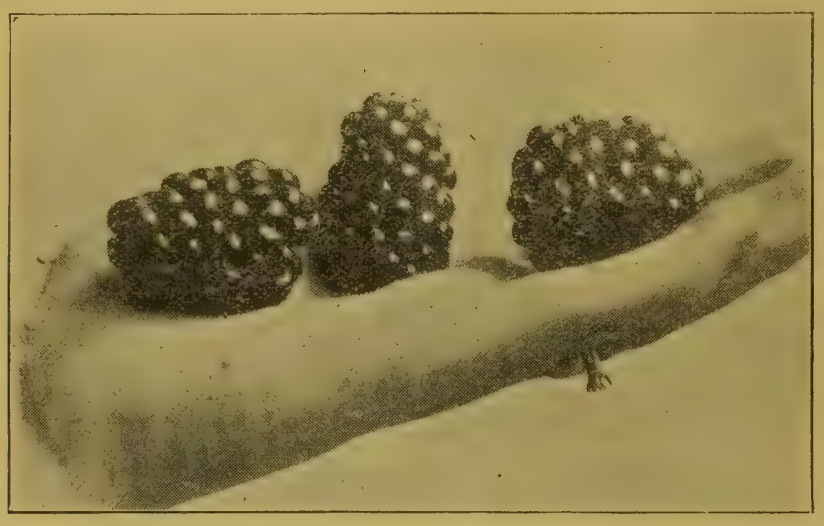
The Gardena Dewberry

A. R. Rideout of Whittier Tells the Why and the How of the Famous Profit-Bringing Berry.

When I first heard of the Gray Gardena dewberry and the wonderful results obtained from one-half acre—$800 gross, or over $500 net—my curiosity was aroused and I was not content till I owned a patch of them myself. I could see a small fortune in them. Mr. V. W. Gray, son of the man who first introduced them, owned five acres at Whittier, Cal., which were planted less than one year when I purchased the patch, paying over $1100, for the plants on leased ground for two years, besides $50 each year to the owner of the ground.



A LUSCIOUS HAND-OUT.

My friends thought I was making a mistake, but it has proven to be the best investment I ever made. I then purchased five acres joining and set it out to dewberries. Then securing a photograph, of which the large cut on first page is a reproduction. I started out to canvass and with the help of the picture in a few days had sold several hundred dollars' worth of plants, selling them readily for one dollar a dozen, five dollars per hundred, and twenty-five dollars per thousand.

When my berries began to ripen I went to see the neighboring patches. In my visitations called on Mr. Rains, of Signal Hill, who had two acres. He was well pleased with the prospects before him. Said he: "I have sold all my plants and am taking orders for next year." Then turning rather suddenly, he said: "Come! I want to show you something very peculiar." I followed him a few feet, when we came to some vines which did not look like the rest. They were of a darker color. The leaves more irregular and of a more ragged nature, resembling in shape that of a grape.

The berries were smaller and not properly fertilized, showing distinctly two different varieties. I went wonderingly home and to my sorrow found the same state of affairs to exist in my own patch, but with the help of a shovel and hired man dug them up root and branch. So completely did we eradicate them I could not find a branch or leaf, though I looked several hours to get one to photograph with the other kind to show the difference on this page.

The nature of the Dewberry is to creep on the ground, so do not string them on poles or wires six feet high or more. I don't approve of using wires at all, for I consider it a needless expense, and a never-ending job (perpetual motion demonstrated). Never wire these berries up unless on glaring sandy soil where the sand would be liable to scald the berries if close to the surface.

The Gardena dewberry proper is a marvel. Its fame spreads like wild fire. I have already shipped plants to several eastern States and before the season is over expect to ship to almost every State in the Union.

It is noted for its vigorous plant growth, frost and disease resisting qualities, certainty of crop, and enormous yield of large and early berries.

A patch in full bloom is a beautiful sight to see, resembling snow. Every bud that starts pushes itself to the surface and above the plant growth, thus making picking a very pleasant task.

Planting.—The best time for planting is in February; March is very good; they will grow when planted in April, with fair returns. Do not plant extensively in May, though a few may be planted in the garden. First get good, strong plants, having been planted for that purpose, not ends or pieces of vines, with a few roots hanging to them like filings to a magnet.

The rows should be five feet apart and plants two feet in the row; throw a furrow each way, break off the stem, place right side up, spread out the roots naturally and cover four inches deep with hoe or plow. Run the water down the furrow immediately after planting. Irrigate every few days until the plants get well started. In a short time the plants will be up and form a shade which will keep the ground from baking. Throw the vines over each other, keeping them in rows two feet wide. Cultivate when needed, keeping the weeds down.

To secure plants, bury the ends of the vines about the middle of October and you will raise 15 to 20 tips to every mother plant. Very little trouble to raise plants.

Care.—Do not trim the vines at all, only keep the suckers cut down during berry season as this facilitates picking and adds strength to the vines. When the crop is harvested, secure a large hoe, cut them off even with or just below the ground, leave the vines where they fall, just as they grew; the new shoots will soon be up and cover the old vines, which form a trellis, but should the vines be infected with scale or disease, run a furrow by each row and bury them.

The berries themselves resemble a blackberry, being much larger and fewer seeds. They are inclined to be a little tart, thus making them a most excellent berry for canning, pies, jellies, etc., but when fully ripe they make a tempting dessert, served fresh with sugar and cream.

They begin ripening in the latter part of April and early May, thus securing the highest prices. This compels the blackberry to take a back seat or go to the cannery. They are a firm berry for shipping. Last year I shipped to Albuquerque, New Mexico, with pleasing results.

Some say, "Will not this business be over done." You can raise dewberries for 60c a crate (3-4 lb. boxes) and then make money.

A Few Don'ts.—Don't throw your gloves away when a hole wears in them, just mend it with tire tape.

Don't think you are saving money by saving water.

Don't forget to order an extra paper of this issue and send to your friend.

Don't put off ordering your plants till late in the season; they will grow then, but don't like to.

Don't forget the address, A. R. Rideout, Whittier, Cal., the place to get the Improved Gardena Dewberry, at a reasonable price. Questions gladly answered.

Special inducement to nursery men.

THE WAY THEY GROW.

VETERINARY DEPARTMENT

BY DR. W. J. OLIVER,
109 Gold Ave., Los Angeles.

COUGH AND JAW SWELLING.

Editor Cultivator: I should like to know what to give horses afflicted with severe cough accompanied by discharge from nostrils and general prostration.

Do you think it advisable to bring swellings under the jaw or on the neck to a head by the use of liniment? If you advise the use of a liniment, what formula can you give for such liniment?—Subscriber, San Jose.

For cough give the following: Chlorate Potassium 8 oz., Muriate Ammmonia 8 oz., Licorice powder 4 oz. Dose: Give dessert spoonful on the tongue or in bran mash twice a day. The swelling should be brought to head. Use the following liniment rubbed well in once a day: Equal parts of aqua ammonia, turpentine and oil. Shake before using.

* * *

SLOBBERS IN HORSES.

Editor Cultivator: I have a mare that slobbers very badly and has been doing so for several months. Her mouth is cut some by barley beards but I think this does not affect her very much. I clean out the beards often. She slobbers more when she has the bit in her mouth. I feed mostly barley hay, with a little alfalfa for a change. Kindly advise through the Cultivator.—Subscriber.

Use a wash of two drams of powdered alum to a quart of water. Feed alfalfa until mouth gets entirely well. It may be that some defect of your horse's mouth was overlooked at the time of operation.

* * *

FEVER FROM CALVING.

Editor Cultivator: I have a Jersey heifer that came fresh about three weeks ago, but did not clean properly. I have given her salts, and condition powders, but she does not seem to improve any. She has very little appetite and her milk has a feverish smell. What can I do to help her?—R. W. Barkham, Oakland, Cal.

Wash uterus out well twice a day with solution of one oz. of crealin to one quart of water. Treatment, internally: Give four drams of tincture nux vomica with four drams of tincture of gentian at one dose three times a day.

* * *

Editor Cultivator: In the California Cultivator, Jan. 15, under the title of warts you speak of chromic acid. I have a yearling which has perhaps 75 warts on the body. What medicine can be given internally to good advantage?—Chas. A. Miller, Pomona.

Try the chromic acid as recommended in Cultivator. You can give ½ dram doses of iodide potassium night and morning.

The Santa Fe will shortly inaugurate a new scheme for tracing cars of freight between Los Angeles and San Francisco. The idea, if extended to fruit cars en transit to the east, will be of great value as the location of cars can be determined at any time, also the date of arrival to points of consignment can be known to shipper.

CITRUS TREES

All the leading varieties. This stock is the cleanest and finest grown. Can fill any sized order and will guarantee satisfaction in price and quality. Write for further information.

W. G. HALL - GLENDORA, CAL.

"He who plants a tree plants hope."—LUCY LARCUM.

But

He who plants Citrus Trees grown by the San Dimas Citrus Nurseries—the largest producers of orange and lemon trees in the world—plants the nucleus of a competence. Why? For the simple reason that their trees are grown with the sole object in view of bearing regular and profitable crops for their owners. Since their citrus nursery stock finds a a market wherever the orange luxuriates, the truth of the above statement is amply verified.

Plant Citrus Trees Now

Because then they will get the full benefit of the spring rains, which will cause a strong growth with the advent of warm weather. Besides, to place your orders early means that you will be sure and secure a good selection of trees, both as to varieties as well as to quality.

Interested, Are You?

Then let us get together and talk trees, fruit and methods of planting and caring for an orchard. Remember, correspondence with us is a pleasure when it implies that you contemplate planting citrus trees. Having made citrus tree growing an exclusive business, and the study of orange and lemon culture almost a life work, we believe that we can offer you better trees at more attractive prices than anyone else. A letter may strengthen this view with you. Our pamphlet on the orange and the lemon is yours if you mention this advertisement when you write.

Coast News and Notes

OF INTEREST TO FRUIT GROWERS, STOCKMEN AND AGRICULTURISTS

LIVE STOCK.

An experimental auction sale of registered short horn cattle will be held at Spokane, March 8th, which, if it proves successful, will be made an annual event.

The Norwalk Call states that Sessions & Platt, proprietors of the Belle Vernon Farms Company, have purchased the creamery at Studebaker.

The Southern Pacific railway are after cattle shippers, who, it is alleged, have shipped out hides with cattle consignments, using them for bedding.

The bonds for a union high school at Gardena have been defeated.

Governor Pardee has been ill for a week with a severe attack of grippe.

Riverside will have at the St. Louis fair a mammoth irrigation display.

The government has sent to the Indians at Martinez a half carload of farm implements.

The San Diego Rochdale Company at present writing has 227 members, and more are joining daily.

Mr. Simon Stiffler has sold his ten-acre ranch near Carmenita to Mrs. Martha Meeker of Long Beach.

The third annual convention of California Federated Women's clubs has been held in Sacramento this week.

San Diego will have at the St. Louis Exposition one carload of minerals and four carloads of oranges and fruit in glass.

The Iowa Society of Southern California will meet in annual picnic on the 22nd of February. at East Lake Park, Los Angeles.

Hollywood will vote in March on a proposition to build a high school to cost $65,000, and two grammar schools to cost $15,000 each.

The will of Dr. John I. Baty, of San Jose, bequeaths $12,000 to the president of the Santa Clara College, in trust for religious and benevolent objects.

Statistics collected by the California Promotion Committee show that California has made marvelous gains in population since the census of 1900.

The successful oiling of California highways has suggested the possible oiling of irrigating canals to make them hold water better and so avoid losses by seepage.

The S. P. Company and the city of Santa Ana are in a controversy as to which owns certain railroad crossings. The company proposes to fence them up and let the courts determine the matter.

The Hanford Sentinel says that Frank Blakely commenced this week the seeding of ten sections of lake land, at the mouth of Kings river, to wheat and barley.

The Pacific Transportation Company of San Francisco, have decided to lay a pipe line from the Coalinga oil field to Antioch, a point on the Suison bay, from which San Francisco bay can be reached by boat.

Los Angeles County will have at the St. Louis Exposition two cars of fruit in glass, canned goods, nuts, wines, vegetables and statistical matter; one carload of minerals and one carload of orange trees, palms, etc.

Tulare County has decided not to send its collection of fruits, grain, etc., to the St. Louis Exposition, owing to the ruling of the management that no advertising matter will be allowed to be given out with the display.

Los Angeles, the second largest city in the State, had in 1890, a population of 50,395; in 1900, 102,479. The population of Los Angeles in 1903, as given by the clerk of Los Angeles County, is estimated at 150,000, an increase in the three years of 47,521, being 15,840 each year, or three times greater than the yearly average for the ten years previous.

The Coachella Valley Producers' Association held an important meeting Saturday at Coachella. A large representation of melon growers responded. The consensus of opinion was that the acreage of melons this season will be largely in excess of last year.

Orange County will export for exhibition at the St. Louis fair, one carload of fruit in glass, grains, nuts, chili peppers ,and other miscellaneous products. Ventura will exhibit beans, minerals, grain and nuts. Santa Barbara County will show palms and exotic plants, fruit in glass, grain and oil.

A meeting to consolidate all the co-operative agricultural interests in the Mississippi valley will be held at Omaha, March 1st, the new organization to be known as the National Farmers' Exchange, with a capital of $50,000,000. From a knowledge of some of the leading men behind the project we do not believe it will be a success.

It is estimated that San Francisco alone has increased in population over 100,000 since 1900. A conservative estimate places the city's population today at 450,000. This is exclusive of the bay cities immediately adjacent to San Francisco, the population of which can be safely estimated at 150,000, making in all 600,000 people about the bay of San Francisco.

Should the Frye bill, now before Congress, pass, the probabilities are that great cordage manufactories will be started on the Pacific Coast. The bill provides that American commerce with the Philippines be carried in American instead of foreign ships. As the available American ships are all on the Pacific ocean the shipping of Manila hemp will be transferred from the Atlantic to the Pacific Coast.

The population of California in 1900 was 1,485,053, showing an increase over that of 1890 of 276,923 and, assuming on a conservative estimate based on returns already received that the population of the State has increased 20 per cent since 1900, an increase would be shown of 297,000 for the three years, or 20,000 more than the total increase for the ten years previous. At this rate, the population at the time of the census of 1910 will be approximately 2,500,000.

Consumption of oil as fuel on the Santa Fe will be increased between 30,000 and 35,000 barrels a month by the end of February, when the company will have in service several of its new, monster freight engines, forty-five of which have been consigned by Chicago headquarters for service in the company's local jurisdiction. The district between Winslow and Seligman, in Arizona, is the last to be equipped for oil burning, and all the new machines will be in shape to handle the soft fuel.

Somewhere in the White Mountains of Arizona, near the Indian reservation, is a mineral field of wonderful richness, says the Mining and Engineering Review. The location is known to but one person, an old prospector named Williams, and he refuses to tell where it is. He says it is within forty miles of Clifton, to which town he takes his gold and whence he obtains his supplies. He has thus far evaded those who have sought to track him to his claim, and he frankly owns that he hopes to keep his secret to himself for a long time. About a year ago he took to Clifton several hundred dollars' worth of coarse gold, which he had pounded out of rotton quartz. Since then he has made several trips, each time bringing in a similar amount of the precious metal. Lately he came again, bringing the usual amount of gold, and in addition a two-pound lump of platinum, a metal rarely found in the pure state. Williams says he has a hill full of gold and other metals and when he has prospected to his satisfaction and taken out his "pile" he promises to give the world a sensation by disclosing the richest field yet discovered.

Arizona Everbearing Strawberry Plants

Well rooted, thrifty plants, grown on virgin soil, layered by hand, fertilized when runners started. L. H. EDMISTON, Riverside, Cal.

200,000 Strawberry PLANTS

Arizona Everbearing from Eastern Plants. Guaranteed to be first-class in every respect, not mixed with any other kind, at $2 50 per thousand, if ordered within ten days.

Coast News and Notes

CONTINUED

HORTICULTURE.

C. D. Morris has been appointed as a member of the Horticultural Commission of Santa Barbara county.

The new fruit display for the Los Angeles Chamber of Commerce was shipped last week from Fresno. Geo. C. Roeding furnished a lot of fine Calimyrna figs.

At a meeting of fruit growers held at Fresno last week, it was decided to organize a co-operative cannery company. Another meeting will be held February 15th to further the organization.

E. M. Garrison and E. S. Ware, district managers of the California Fruit Agency, are in San Dimas and locality investigating the method of protecting cars of fruit against frost. They hope to have found a perfect solution of this proposition.

AGRICULTURE.

A Farmers' Institute will be held at Elsinore the first week in April.

Lima bean straw is selling in Ventura county at $15 per ton.

Solano county will this year set out a large acreage of Tokay grapes and cherry trees.

The Oxnard and Santa Maria sugar factories are irrigating large tracts of land for beets.

Christian G. Frash, the pioneer raisin grower of Fresno, died at Philadelphia, last week. Mr. Frash planted the first vineyard at Fresno in the winter of 1872-73.

The Lompoc Record says "Henry Miller, of that place, has a million tons of hay in stack, some of which was cut ten years ago." Now would be a good time to let go.

The directors of the Raisin Growers' Association at Fresno have been requested to give twelve cars of raisins to the committee to distribute free at the World's Fair next summer. It is thought the request will be granted as a matter of business. The distribution will make good advertising.

MISCELLANEOUS.

Dr. H. Russell Burner is fitting up a sanitarium at Carlsbad, San Diego county.

The government is establishing a new forest reserve near Baker City, Oregon.

F. J. Delano has purchased the Rubidoux packing house at Riverside. Consideration $5,500.

Last week the supervisors purchased a new court house site in Sacramento, paying therefor $68,800.

The committee of improvement on streets, in Garvanza, has decided to plant alternately palms and live oaks.

The City Council of Stockton has granted R. G. Paddock a franchise for installing a heat and power system in that city.

The U. S. Senate by vote last Friday, agreed to the $4.600,000 loan by the Government to the St. Louis Exposition Company.

The Board of Trade of Oakland to the number of 250 were the guests of the Los Angeles Chamber of Commerce this week.

At the city election in April, the Azusa trustees will submit the question of prohibition to the voters of that municipality.

Electricity has taken the place of candles at the San Gabriel Mission. Thus is the wheel of progress steadily displacing ancient methods.

The Y. M. C. A. State convention held on Friday of last week at Fresno, elected C. E. Rumsey, of Riverside, president for the coming year.

The Pacific Coast Poultry Association has been incorporated at Santa Rosa. It is composed partly of the Co-operative Poultry Association.

Work on the new natural gas plant at Ventura is rapidly progressing.

The supervisors of San Diego county have granted the petition of the Imperial electors for the incorporation of Imperial as a city of the sixth class.

The treasurer of Santa Cruz county, Arizona, had $25,000 on deposit in the Nogales International Bank, which failed recently. He is likely to lose it all.

Placer, Yolo and Glenn counties have each appropriated their share of the $30.000 to be raised by the Sacramento valley for a great exhibit at the St. Louis Fair.

The San Francisco Kennel Club is making active preliminary arrangements for its eighth annual bench show, which will be held 13th, 14th 15th and 16th.

The California Commissioners to the St. Louis Exposition have discovered that the freight charges on the State's exhibit will exceed the appropriation for that purpose.

For whistling after a girl passing along the street, the police judge of Oakland fined two young men $50 each, and seventeen days in jail. Let other judges do likewise.

San Francisco merchants have put themselves on record in opposition to the parcels post bill. Whereat the Alameda Encinal says: "San Francisco merchants show themselves very short-sighted and blind to their own interests."

The first suit to be filed in San Bernardino county under the recent decision in the famous Katz-Walkenshaw water litigation has been filed at Riverside for an injunction to prevent the Excelsior company from draining the land of Lucas Montijo, of Colton.

The president of the Anaheim Union Water Co., in his annual report states that the company is in good condition. That if the treasury stock on hand were to be disposed of at present value there would be enough money on hand to pay all indebtedness and leave a balance of $40.000.

Alexander McAdie gives the following summary of crop conditions for the past week: The weather continued clear and frosty during the early part of the week, and was followed by cooler, cloudy weather, with rain in all parts of the State and fairly heavy snowfall in the mountain districts. High winds prevailed in some sections, but caused no damage.

The precipitation was the heaviest of the season in all the southern districts, and will probably improve conditions to such an extent that with the customary later rains fair crops of grain and hay will be harvested. Plowing and seeding will be resumed immediately. In the central and northern portions of the State rain was not so badly needed, but its coming will result in vastly improved conditions of the soil, as well as of grain, hay and pasturage. The early sown grain is in good condition, but its growth has been slow during the cold weather, and the later sown has not made a satisfactory showing for the same reason. The grain acreage in the Sacramento valley is reported considerably larger than that of last season, and prospects are good for heavy crops of wheat, oats and barley.

Work continues in orchards and vineyards, and deciduous fruit prospects are good in all the central and northern sections. The tree and vine acreage is being increased in many places. There are no reports of damage by frost to orange or fruit trees. Almonds are in bloom at Belmont.

BREAKING THE HEIFER.

Most farmers and dairymen have trouble in milking the heifer with her first calf, and simply because they do not remember that the process of milking is entirely new to the animal, and, naturally, she is more or less disturbed. A veteran raiser of calves makes it a business to handle his animals more or less daily, and as the heifer gets near to the time to drop her calf the udder and teats are gently handled and pulled each day. This plan is not only beneficial, but the heifer gets used to it and is not likely to make much trouble, when she is milked, for the first time. Whatever the plan in handling is, be gentle with the heifer. The Farmer's' Sentinel gives the following rule for breaking heifers:

Handle the teats firmly, yet gently, rubbing them through the hands lightly before beginning the pressure which brings the milk. In changing from one pair to the other, do it gradually by handling the second pair a little. After a week of this gentle treatment there is likely to be less trouble of any kind unless the milker forgets and becomes rough, in which case he need not be surprised if he is kicked off his stool by the gentle and frightened heifer."

BIG DAIRY BUREAU FIGURES.

The State Dairy Bureau has just completed the compilation of statistics of the butter and cheese output of California during the last year. It is shown that the increase over the output of the preceding season was 3,075,213 pounds. Altogether the dairy output amounted to $20,436,152 last season. Secretary Saylor claims that the dairy interest is the largest income producer of any single line of industry in California.

The butter produced last season was worth $8,669,077. The cheese sold for $856,996. Condensed milk represented the value of $621,233. The people of California consumed $6,682,738 worth of milk. Calves raised and sold for veal brought in $1,724,844, and the pork that was raised by products had a value of $881,264.

"These figures," says Secretary Saylor, "are based upon a most conservative basis. The gold mines of California have made the State famous throughout the civilized world, and yet the value of the product of the dairy cows of the State for the last year exceeds that of the gold output for 1902 by more than $3,000,000.

"The coast counties, excepting Los Angeles and San Diego in the extreme southern end of the State, have just about held their own, Humboldt county, the largest butter producer in the State, showing a slight decline. The gain is, therefore, confined almost entirely to the counties in Southern California, the San Joaquin and a portion of the Sacramento valley. During the season two more counties crossed the 1,000,000-pound mark. They are Stanislaus and Tulare, making nine in the State with an annual output of over 1,000,000 pounds."

SHEEP SHOULD BE DIPPED.

The successful sheep feeder of later years have prospered simply because they have resorted frequently to the dipping tank. The parasites that sap the vitality of the sheep and produce the disease known as scab can be eradicated by intelligent dipping and in no other way. Nearly all of the leading stock yards of the country have conveniences for dipping sheep. No sheep are allowed to be shipped from the Chicago stock yards without being first thoroughly dipped. All of these precautions are important, but they do not reach the case. The sheep feeder who relies upon one dipping to eradicate mites and the eggs that produces scab will surely fail. It is well enough, perhaps, to dip sheep before they leave the stock yards, but if they are put back into infected cars for shipment, what has been gained? The wise feeder will build a quarantine yard on his farm, where he can put his western sheep upon arrival, and they should be left in this yard until they can be thoroughly dipped. Nothing but new arrivals should be put in this yard. The feeder should not be satisfied with one dipping, but should dip again after five or six days have elapsed. If western sheep are taken to a farm for feeding, they should be kept separate from the regular flock until the dipping operation has been thoroughly accomplished.—Chicago Live Stock World.

SURE OF TOP PRICE.

"The only butter sure to bring the top price, at all seasons," says the Chicago Dairy Produce," is the extra creamery." This is especially true of California. "Market prices may vary and the market be crowded or contain little butter. Supply and demand control the quotation, and the extras sell at the top price, whatever that may be. If the market is dull for extras the under grades are in a worse condition; if the market is active and extra creamery so scarce that it is impossible to supply the demand, and faulty butter is accepted as extra, then the latter is bringing a premium. When any butter is moving the extras are a chief part of the movement. The recent condition of the market, known as the after holiday dull season, has shown the difficulty of selling under grades at such times. The fact is they have been difficult and, at times, impossible to move. On the other hand, the extra creamery has been scarce. Prices declined because of the pressure to sell storage butter, but the extras were in good demand and were kept cleared, moving out about as fast as received."

PASTURIZING MILK.

Editor Cultivator: In a recent article on "Pasteurizing Milk," which appeared in your paper, you give the impression that the milk is pasteurized in tanks. This is not the case. The milk is pasteurized by the Miller Pasteurizer, which machine consists of one large tinned copper cylinder inside of another similar one, between which a space of only one-sixteenth of an inch is left, through which the milk must pass rapidly between an inside and outside hot-water surface, thus being absolutely uniformly heated to one hundred and sixty degrees in less than half a minute, or higher if desired. The following cooling is carried out in practically the same manner, only cold water, and afterwards brine, taking the place of hot, and reducing

the temperature in less than a minute to forty degrees or less. I hope the Cultivator will print this statement as it is important that people should have a clear understanding as to what a perfect and uniform pasteurization means. Only by using the most up-to-date methods is it possible to put a pasteurized product on the market which, while in no way inferior in flavor and nutrition to the best raw milk, possesses great advantages as to uniform purity and freedom from objectionable germs, as well as being of far superior keeping qualities.—J. Moldenhawer, of Hoard's Dairyman.

SHEEP ON THE FARM.

Prof. Kennedy, of the Iowa Experimental station, an authority on sheep and cattle raising, says:

"Less labor is required in handling sheep than almost any other kind if stock. During a large portion of the year they will take care of themselves and at the same time utilize the weeds and other wastes found on so many farms. True it is that at certain seasons of the year they must be given food, care and attention. This is especially so at lambing time. The successful flock master is the one who watches the old and young closely at this season of the year."

FEEDS FOR THE COW.

A cow will not do her best unless she has all the feed she wants, but the feed that she takes daily should not contain more nutriment that she needs. In order to approximately adjust the nutriment to her needs and at the same time permit her to eat all she wants is where scientific feeding must be practiced. It has been found that cows need nutriment first in proportion to the milk they give, second in proportion to the quality of the milk, and third in proportion to the size of the cow.

But one of these conditions is practically eliminated in the case of common cows, as they are found on the average farm, for they, as a rule, give milk testing on an average 3.8 per cent butter fat, so no adjustment need be made in regard to the quality of the milk yielded.

By letting cows eat rough at will the adjusting of feed to size of cow will be accomplished and the only adjustment left for the farmer to attend to is for the quantity of milk yielded.

We have found that if cows receive one pound of grain mixture for every three pounds of milk yielded per day the flow of milk is maintained if she is otherwise properly cared for. So, if a cow gives twenty-one pounds of milk daily, she needs seven pounds of grain mixture, and if she gives twenty-four pounds of milk, she should have eight pounds of meal. Give half the grain in the morning and half in the evening, and the same with the hay. But the hay should be fed after milking, while it is best to let the cows eat the meal while they are being milked.

Now, when a farmer goes to the trouble of feeding his cows properly it is quite as necessary to see that the other conditions referred to be looked after.

First, the cows should be kept comfortable. No matter how well cows are fed they will not give a full flow of milk if they are not comfortable. They should not be left out in the cold.

The stable should be warm, well ventilated and lighted, and their stalls well bedded.

Their drinking water should not be below 60 degrees, they should be watered, fed, and milked regularly. They should always occupy the same stall, so when they are in their stall they will feel at home and not be discontented.

Kind, quiet, and gentle treatment has a wonderful influence on the flow of milk.

If all other things are provided and kind treatment is lacking the best results will not be attained.—Prof. Hacker in Kimball's Dairyman.

BITTER MILK.

Editor Cultivator: With reference to the article in your last week's paper by Mr. McClatchie, I do not think that the bitterness is caused by either of the two causes named. The fact given by him as a cause, "that a cow gives bitterish, salty milk during the latter part of the period of lactation," is undoubtedly true; and that fact may furnish a clue to the solution of the question. In a certain town in Wisconsin, about twenty-five years ago, we had an accomplished York State cheesemaker running our factory. I said to him, one day in October, "Do you know why your fall-made cheese is always bitter, whereas your spring and summer made cheese is not bitter?" He answered, "I do not, and it has often puzzled me." "It is because nearly all the cows are in calf in the fall of the year," I said; "I have studied the matter over carefully." There is no doubt that the milk through the entire period of lactation will be slightly tinged by certain herbs, and by other food—as turnips, for example. But the peculiar bitterness of the milk in the late fall of the year is, in my opinion, caused as above stated. In California, where the cows have their calves at all times of the year, the general fact will be as stated by your correspondent, that we must expect bittter milk "during the latter part of the period of lactation" at any time of the year. I give my opinion; but of course, I cannot demonstrate it. It is a question for scientific investigation—the influence of pregnancy on the bodily secretions.—B. E., Riverside.

DANGER IN DIPPING.

Referring to the dipping of cattle, State Veterinarian Blemer says: "To dip cattle in coal oil will result in unnecessary loss." "What we want," he says, is "to obtain from the government permission to remove clean cattle to other States where cattle are wanted. For instance, there are buyers in the south from the State of Colorado who will take several thousand head of stock if they can remove them to that State. These cattle are not infected, and to dip them in oil in their present enfeebled state would kill a large percentage of them."

"There is no question of throwing down the quarantine line of the State and removing infected cattle into the north or to other States. Such cattle as would be allowed to be moved would be first inspected and would be thoroughly free from disease, and the stockmen of Northern California need not fear that they will spread any disease.

"There is a vast difference between the conditions existing in 1898 and now. At that time there was no quarantine line and no inspection of cattle, and the result was that infected cattle were brought north and they infected the other herds. I have numerous inquiries from buyers in Northern California regarding the purchase of southern cattle, and every head that is moved out of the south will be some help."

The Bureau of Publicity of the St. Louis Exposition has compiled a brief history of the life of F. D. Coburn, chief of the Department of Live Stock at the World's Fair. The article will interest the stock raiser because it will appear therefrom that Coburn has been a life-long student of cattle, and that his experience is so varied as to make him an expert in all matters pertaining to the live stock industry.

He was born on a farm in Jefferson, Wis., in 1846. He served in the civil war, was mustered out in 1866, and went to Kansas in the following year, walking across the Missouri river on the ice to reach the State he has since so notably served. He then engaged in farming and live stock breeding until 1880, when he was called to Topeka in the service of the State Board of Agriculture. He was elected Secretary of the Board, and has ever since held that office. Aside from his famous Kansas red line series of reports, he has written many books that are recognized as standard authorities. He has also been a contributor on live stock and agricultural subjects to the leading encyclopedias.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

FEEDING FOR PROFIT.

We all want to make money with our poultry, or to get eggs which, from a market point of view, is the same as cash, and I think a chat on the feeding problem will help a good many.

* * *

Feeding for Profit.—This subject is vast enough for a professor to tackle and I almost dread to begin, but I hope some of our ten thousand or more readers will talk back, and give us some ideas on the subject, for you know doctors differ, and I am sure poultry men do also, in their ways of feeding, and in the food itself. I have tried quite a number of feeds and also ways of feeding, and some of my experiences may help others.

Last week we decided that the way to build up a great egg laying flock was to breed from the best layers mated to sons of great layers, and to feed for eggs. This plan seems to agree with the well known laws of heredity, and the commonly accepted rules of breeding both animals and plants. But by "best layers" I do not mean hens that have been forced for laying as pullets fed stimulants, and pushed for all they are worth. I would not use such hens, nor choose breeding males that are sons of such females. The result would probably be infertile eggs eggs not sufficiently stocked with nourishment to support the germ, poorly hatched, short lived chicks, and weak, deterioriated stock.

Feeding for breeders and feeding for eggs are two different objects, and diametrically opposite.

* * *

Feeding for Breeders.—In feeding our breeders we can well take a hint from the breeders of race horses; they feed their brood animals for vigor, bone and muscle, they give them regular exercise and plenty of it, and their pricipal food is oats. "Oats" was defined by Dr. Johnson as "food for men in Scotland and for horses in England." De Guthrie replied, "And where will you find such men as in Scotland and such horses as in England?" Oats, then, seem to be acknowledged the greatest muscle and bone producing grain that is known. Let oats be largely fed to the breeders. This may seem like extravagance, but the addition of a dozen chickens to the hatch and the extra vigor of the chicks hatched from eggs which contain a larger percentage of bone and muscle making nourishment will in the end pay. We all know that eggs will be flavored by the food the hens eat, why then should not the eggs also contain much of the elements of the food fed? Green food also is an absolute necessity for the breeders. This I know by sad experience, for the first year I was in California, the hens ate up all the alfalfa in their yards, and killed it, and gradually the yolks in the eggs grew paler until they were a faint straw color and the fertility decreased at the same rate, until I suspected the cause; they had not sufficient green food. Plenty of oats and all the green food they will eat. How do you feed your oats? I buy at wholesale the rolled breakfast oats, the best quality, to feed my breeders. My reason for using this quality is that the second, or cheaper grade, is mixed with rolled wheat, is not pure oats, also the rolled oats is cheaper here than the steel cut. The unhulled oats can be used by soaking them, but I tried the plan and counted the cost and found that the rolled oats, deducting the weight of the hulls cost so little extra and was so much more satisfactory, being without waste, that I finally used nothing but the Nudevin rolled oats.

One of the most important things, and something that is overlooked by many poultry raisers, is the need of exercise. This is just as important as the proper food. The breeders must be made to scratch, for this exercise develops and strengthens the egg making organs. Exercise is quite as important as feed. Fowls that eat their breakfast, then stand in a corner and wait for dinner, and likewise for supper, never produce many eggs and are very poor breeders. Breeders must be made to exercise. The scratching shed or pen should contain plenty of loose material, such as straw or hay, in which the grain can be buried deeply, so as to insure plenty of exercise in scratching it out. This should take up the best half of the day. Some people feed the mash in the morning. I have had much better results by feeding the whole grain in the morning in the scratching shed, as it keeps the fowls more healthy and active. I feed equal parts of rolled oats, wheat and cracked corn or kaffir corn, a small handful for each fowl, thrown into the scratching shed. At noon I feed green feed either finely cut clover, alfalfa, or a cabbage, beet, half a pumpkin, lettuce, or any vegetables I may have. At four o'clock I feed the mash. This is somewhat varied, for I try to balance the ration at night, but the foundation of this for my breeders is two parts bran, one part feed meal, one part oat meal and four parts cut clover or cut alfalfa, a little charcoal and a little salt. I mix the mash with milk if I have it, if not I add five per cent (that is one-twentieth part) of meat meal or dried blood. I occasionally also add table scraps or bread soaked in milk. I try to feed them a balanced ration of 1:4. Three times a week the breeding pens have some green ground bone, and they always have a liberal supply of grit, shell, charcoal, and dried bone before them.

* * *

Pure Drinking Water.—Another necessity is pure drinking water. Each yard has a water hydrant and three times a day the fowls have fresh, clean water in an iron kettle. My fowls were of the American breeds and I fed about six ounces (dry weight) per hen. Edgar Warren says: Feed one ounce for every pound of hen. This is good advice. I never give my breeding pens red pepper or any stimulants as I am afraid of weakening or irritating the egg producing organs and I want vigorous breeders to lay eggs that will hatch vigorous young chicks.

Forcing for egg production, feeding little chicks, feeding broilers, fryers, roasters and capons, also dressing and marketing fowls will be subjects of my next article.

* * *

ANSWERS TO QUESTIONS.

Geese.—Mrs. Basley: As there is no one in this part advertising Toulouse geese or eggs for sale, I drop you these few lines to ask if you know any one selling Toulouse geese eggs. There are none advertised in the Cultivator, as I have watched to see if some one would advertise, but none as yet. Kindly let me know.—Hugh O. Higgins. P. O. Box 741, Riverside, Cal.

I am sorry I do not know of any one; perhaps some of our readers have them; if so please write to Mr. Hig-

Cockerels Barred Rocks, Black Langshans, Light Brahmas and Partridge Cochins. Over thirty of these choice birds at $2 and $3 each. Eggs, $1.50 per 14. B. B. P. YDS., CARLSBAD, CAL.

gins, and at the same time send an ad. to the Cultivator. I am glad that some of the turkey breeders have put advertisements in the Cultivator and hope others will soon, as since I wrote on the care of young turkeys there has been a great demand for turkey eggs for hatching.

Feeding Ducks.—Ed. Cultivator: I have purchased some Indian Runner ducks and would like to know what would be the best feed for them. Also if it would be better for them to have water or not.—H. F. P. Colton.

P. S.—Please reply through the Cultivator.

In the Cultivator of March 20th, 1903, full directions were given for feeding and caring for Indian Runner ducks; if you cannot find your copy send stamps to this office for the paper.

Ticks.—Editor Cultivator: Will you please tell me through the columns of the Cultivator what will exterminate ticks from a hen house. They hide in the wood in daytime, come out at night and bite the chicks.—A Subscriber.

Kerosene emulsion sprayed on will thoroughly exterminate them. See a long description of how to make and use it by government experiment station in the Cultivator of Oct. 23, '93; if you have mislaid your copy send stamps to the office for another.

Chickens Dying.—Will you please tell me what is the matter with my chickens and what treatment they should receive. I have lost a good many within the last month. First I notice that they act as if the head was affected, then the legs become weak, and then they stagger about the yard. Then the legs become stiff so they seem to almost lose the use of them, and after about two weeks die. Am feeding whole corn; so far only half grown chickens have been affected. I use iron pipe for roosts.—A Subscriber.

You do not say how you feed, nor whether your chicks have grit, charcoal, clean water, dry, warm, comfortable houses, free from lice, mites. The symptoms denote indigestion, lice and rheumatism. The iron pipe for a roost would account for it. Poor little chicks! take an iron pipe to bed with you and you will a little bit realize how those tender little feet and legs must suffer the whole night long. It is enough to kill them all and will certainly stunt those that survive. Also you say you feed whole corn; do you mean that is their only feed? If so you certainly must give a greater variety. Next week I shall have an article on feeding chicks which may help you. Or if you write me more fully your method of feeding I will gladly tell you what I think about it.

* * *

Feeding.—Do you find any great egg value in oats? I have a poultry friend who gives oats credit for most of his eggs. Answer through Cultivator.—Ida A. C.

Next week I will give various formulas for feeding for eggs, etc.

* * *

Keeping Eggs.—Mr. Ernest Braunton asks how long he can keep eggs before placing them under a hen to hatch, as he has some very fine Bantams, but is not ready to commence incubating the eggs.

By turning the eggs over twice a day they may be kept three or four weeks. The object in turning them is to prevent the yolk from settling to one side, also to exercise gently the germ. The germ always comes to the upper side of the yolk and, curiously, it requires exercise to keep it strong and healthy. The smaller the eggs the less time can they be safely kept. The fresher the eggs the better will be the hatch, as if kept too long the germ becomes weak and finally dies with the result that the egg becomes rotten.

* * *

The following is a sample of letters I am receiving daily from distant readers of the Cultivator:

Mrs. A. Basley: I would be pleased to know what your experience has been in poultry and egg raising in California. Is it a profitable business? Can they be raised successfully? At what price can you sell me one hundred thorough-bred hens? What do you know about squab raising for market? Is there any demand for them in Los Angeles? What prices do they bring? What is the average price for poultry and eggs? Thanking you in advance, yours truly, R. E. W., Sioux City, Iowa.

I have not space in this week's Cultivator to answer your enquiries, so must send you a personal letter.

WATER FOWL.

It was the pleasure of the writer to visit the duck farm of James Hague at Oakland recently. Mr. Hague has the most complete duck farm in the State and is an enthusiast in duck raising.

The little ranch is just on the outskirts of Oakland on the banks of a picturesque ravine, the home on one side, the duck runs on the other.

Unfortunately Mr. Hague was not at home, but some of the questions which we would have asked him are answered in the following article, which he has sent to the Cultivator:

There is nothing mysterious about running an incubator. For many years incubators and brooders have been successfully used with profit on both large and small duck plants, and it seems hardly necessary to occupy the Cultivator readers' time with a discussion in favor of artificial incubation. I know the time is at hand that every person wishing to raise ducks should have a first-class incubator and brooder. Duck raising on a large or small scale, rightly conducted, is a very profitable business, no one can deny. Its best feature is that there is no prospect of its being overdone, as there always is and has been a ready market for good young ducks.

To get fertile eggs I mate five ducks with one drake, in Pekins; Indian Runners, eight ducks to one drake; Colored Muscovies, eight ducks with one drake; Black Cayuga, four ducks with one drake; Rouens (fanciers' duck) 6 ducks with two drakes—Rouens being a hard proposition to get fertile eggs from; Gray Calls, six ducks to one drake; Aylesbury, four ducks to one drake; Blue Swedish, four ducks to one drake.

In feeding young ducklings let their first meal consist of stale bread or cracker crumbs, having drinking water with their first meal and always keeping it before them. Feed this two or three days.

Then use Johnnie cake, equal parts bran, flour, corn meal and ground meat (but no baking powder in it); bake so as to be crumbly. Feed this with a sprinkle of sand on it, until 10 or 12 days old.

THOROUGHBREDS CHEAP.

Wishing to change my business, I will sell my entire lot of 400 White Leghorn year-old hens and pullets for $175. Small lots at $7 per dozen. Address C. H. WELLING, SELMA, CAL.

GERMAIN SEED CO. 330 S. MAIN ST. LOS ANGELES

Winner Buffalo World's Fair, Los Angeles, Oakland, Fresno

We won nearly every 1st, 2nd and Special on White Leghorns at Los Angeles, December, 1903. The greatest exhibit ever held west of the Missouri.

WHITE LEGHORNS

Our flock was formerly headed by the Prize Cock of the New York show, whose sire also won the first at New York the previous year. Of our bird, the judge said: "The best-shaped bird I ever saw; the finest tail and carriage I ever saw; the whitest bird I ever saw."

Among the choice leaders now of our flocks is Rob Roy, a most perfect specimen of extremely large, snow white birds, winner of 3 firsts at New York State Fair, and other prominent exhibitions. He is also a remarkable sire of prize winners. One of his cockerels is at present among the leading birds of the Eastern States. Romeo, a 7 lb., large, snowy white bird, winner of first at Madison Square Garden, New York's great show, and winner of first wherever shown, as well as being a remarkable sire. Similar remarks apply to Sunny Jim, a high-class large, perfect bird, from various egg-producing strains of large eggs.

Best Strains, Best Birds, Greatest Layers, Largest Eggs, Up-to-Date in Every Respect. None better. Lay more and larger eggs, 6 and not over 7 to the pound. Test yours.

To our flock of already choice birds, we have recently added some of the best birds to be found among the most famous flocks of the largest and best Eastern breeders, Selected not only for their Show qualities, but more essentially for their laying qualities of la ge eggs, which we have always made our strongest point in breeding or selecting. Among them is "WHITE ROSE," first pullet at Madison Square Garden, January, 1901; first prize pullet at Cortland, December, 1900; also winner of Golden Special for highest-scoring bird in Show, 96½ by Zimmer; also her two full sisters, and the first prize hen at Madison Square Garden, New York, 1903. Judge G. H. Burgott says of her in American Fancier, Jan. 17, 1903; "A typical grand bird." Also others equally good from the same pen. and the prize cockerel at the Pan American World's Fair, (we having previously owned the prize cock and infused his blood in our young stock). We now place him as a splendid addition of new stock, and one of the most perfect speeimens of true type of large pure white Leghorns to be found.

"The hens that lay are the hens that pay." Nearly all flocks of White Leghorns are the old small variety, layers of small eggs; our strain is snow white, large birds, bred for many years to lay more and larger e gs. Ours won many first prizes all over the East at biggest shows as well as Pan-American World's Fair. Such strains of White Leghorns give one-quarter more egg production, cost one-third less for feed and care than any other variety, while the large white eggs sell from 2c to 5c more per dozen. Buy a choice cockerel, the best in California, and improve your flock. Eggs for hatching.

W. W. HOWARD 3024 E. Main St. Los Angeles, Cal.

Lake Avenue Poultry Yards

CAPTAIN MITCHELL
SANTA BARBARA, CAL.

SHOEMAKER'S BOOK ON POULTRY

and ALMANAC for 1904

There is nothing in the world like it. It contains the following: 212 large pages, handsomely illustrated. A number of most beautifully colored plates, true to life. It tells all about all kinds of Thoroughbred Fowls, with life-like illustrations and prices of same. It tells how to raise poultry successfully and how to treat all diseases common among them. It gives working plans and illustrations of convenient Poultry Houses. It tells all about INCURATORS and BROODERS. It gives full instructions for operating all kinds of Incubators. This chapter is marvelously complete and is worth dollars to anyone using an incubator. It gives descriptions and prices of Incubators, Brooders, and all kinds of Poultry Supplies. In fact, it is an encyclopedia of chickendom and will be mailed to anyone on receipt of only 15 cents. Your money refunded, if not pleased. Address

C. C. SHOEMAKER, Box 718, - Freeport, Ill.

Then feed equal parts bran, corn meal, middlings and meat (from table or butcher's shop) with 10 per cent coarse sand and plenty of green barley, rye, oats, cabbage, lettuce, or any kind of greens; mix thoroughly and moisten. Remember, do not have this mixture sloppy. Feed what they will eat up clean, feeding four times a day until one month old. Then three times a day until eight weeks old, then they should be ready for market, weighing ten to twelve pounds per pair.

BEGIN WITH SMALL FLOCKS.

It requires a year's experience to know where the mistakes are made, and if one can learn how to avoid them, one-half of the difficulty will have been overcome. The greatest mistake is in undertaking the business with too many fowls. Begin with a small flock, breed for the kinds preferred and gradually increase until the desired number is secured.

The White Leghorn fowl has some peculiar features which make it a most valuable breed to keep. They are inveterate layers, good breeders, uniform in size and when they have attained their growth, excellent for the table. They do not grow quite as large as the Barred Rock, but they make up in some other qualities for this lack of size. As a California bird, they are very acceptable. They are clean and healthy. Housewomen are exceedingly fond of them.

Geo. H. Stahl of Quincy, Illinois, offers to send free a colored plate showing by eighteen views the development of the chick in the shell. It is said to be of especial value to incubator users. In addition he will send an incubator catalogue of a valuable line of incubators. Mention this paper and Mr. Stahl will give special attention.

If one has a desire to see some 'way up S. C. White Leghorns, the desire may be satisfied by visiting the yards of W. W. Howard at 3024 East Main street, Los Angeles. Mr. Howard told the writer recently that he aimed to capture the principal prize winners of the country. "For instance," he said, "there is a first prize hen from Madison Square," and she was indeed a beauty.

Other first prize birds were shown from both eastern and coast shows. Mr. Howard centers on the S. C. W. Leghorns, and has an exceedingly high average of stock.

* * *

The Chamberlain Perfect Poultry Supply house starts in this week to educate the Pacific coast as to the merits of the various feeds. The Germain Seed Co. of Los Angeles are handling the feed and find excellent results when it has been tested. A catalogue can be had by addressing W. F. Chamberlain, the Perfect Chick Feed Man, St. Louis.

* * *

White Rocks, Indian Games and Bronze turkeys of eastern strains are specalties of Mrs. J. P. Moore of Lamanda Park. Her stock is said to be the finest of these breeds.

* * *

S. W. Morgan, our old friend of Sunnyside, is again announcing his "Good Four"—W. Minorcas, W. Wyandottes, W. Rocks and White Leghorns—and one more can be added which makes it a "Good Five," and that is, Morgan is a "white" man to deal with.

* * *

"Make your own fence." That's the slogan of the Lee Chamberlain Co., of Los Angeles, and the company offers a large quantity of wire at greatly reduced prices. The wire, which is galvanized, is said to have been used for other purposes, which accounts for its greatly reduced price.

* * *

One of our new ads. is that of the Hollywod Rose Co. Last week the types made Mr. Dunscomb say that the expert does "everything" well. It should have read "one" thing well, and by the look of the rose bushes of that company they do have good bushes.

Cockerels - Barred

Thoroughbred Bronze Turkeys

HENRY ALBERS - 315 South Main Street Los Angeles, Cal.

White Leghorns, Black Minorcas, White Wyandottes and Barred Plymouth Rocks

Trophy Winners at Late Los Angeles Show

In each variety my fowls won a share of the regular premiums, and in some thirteen out of a possible twenty-five, or more than all competitors combined. My winning of First, Second, Third, Fourth and Fifth Premiums on White Leghorn Cockerels was the most striking success of the Show. The winning of the National White Wyandotte Club's Blue Ribbon for the best display of White Wyandottes waf equally significant. But over and above all, the winning of the Times Eagle Trophy, the most coveted of all the prizes, awarded for the best display—numbers and quality considered—was the most signal and the most important victory of the entire Show. The handsome Cup offered by The Live Stock Tribune was awarded to my stock on the same grounds. The victories only akd to an already long list. My fowls have received first premiums wherever exhibited. Over eighty premiums in the last five years.

My fowls are not only standard-bred, but utility-bred. Hundreds of customers attest their merit. They have proved their superiority both in the Show Room and as Breeders. There are no better fowls to be found anywhere, East or West. Both Stock and Eggs sold under absolute guarantees.

A PRACTICAL POULTRY PLANT

The Little Poultry Ranch of Captain Mitchell at Santa Barbara, where Beauty and Utility are Brought Together in Finely Bred Birds, which are Profit Winners.

One of the prettiest sections on California's wonderful coast line is that about Santa Barbara. Many little valleys and arroyos running inland into the range of hills which skirt the ocean in that section afford locations for many beautiful little ranches and suburban homes. This is practically true of Montecito, some two or three miles east of the city of Santa Barbara. There many wealthy people have built commodious homes and planted flowers and ornamental trees which add to the natural beauty of the live oaks and sycamores which cover all hillsides and valleys.

The natural beauty of these hills and valleys and the possibilities as homestead sites have drawn many people of wealth and the natural conditions of soil, water and climate have drawn many producers who have an eye to beauty and who use the conditions to secure a good living.

A few weeks since one of the Cultivator staff drove out from Santa Barbara with the poultry ranch of Captain E. Pryce Mitchell as the objective point. The road follows the ocean front for a mile or more, then takes a turn up into the hills, where, winding around hillsides or up little valleys, magnificent homes and productive orchards are passed and delightful views of mountain and of ocean are had.

The explicit instructions as to how to reach Captain Mitchell, given at Santa Barbara, could readily have been followed up, but our interest in surroundings and in the picturesque winding road caused us to lose the road twice, only to give a longer drive and added pleasure. Finally a Mexican was encountered who with "up-hill—down-hill—lots of chickens" and innumerable gestures got us on the right camino."

Soon on the brow of a low hill, we look down the arroyo to the right and see a cottage amongst the live oaks, while further back were hundreds of White Leghorns, Orpingtons, Rocks and Brahmas.

The private winding road down the bluff brings the ocean into view, possibly a mile or more in the distance. The house is on a slight elevation, giving an unobstructed outlook toward the ocean. This view must be had, for, you know, Captain Mitchell is an old sea captain and he must, of course, keep in sight of his former field of work.

But the object of the visit was not to admire the beautiful, but to get from the Captain some ideas on commercial poultry raising. We say commercial poultry, to distinguish from the fancier whose aim is the pleasure of raising a high bred fowl of perfect form and feather.

But it soon developed that while Captain Mitchell's aim is to largely raise fowls for the purpose of securing eggs for market, yet he believes in the use of the well bred fowl to accomplish this. It costs no more to feed, it costs no more to breed, and the results are far more satisfactory, commercially as well as in the pleasure of possession of fine stock.

The Captain soon had us in tow—pardon the nautical expression—and was manifesting pardonable pride in the appointments of his yards. Good, substantial buildings with cement floors predominate. The runs are large and double—that is, two runs to each flock, green stuff growing in one pen while birds range in the other. Besides, alfalfa and white clover lawns will supply other green to keep a regular variety.

A Row of Poultry Houses.—The "jail" for broody hens is a feature of each house. Another fine feature is the ease with which eggs are gathered from the nests.

Some Fine Looking Cockerels.

The houses are all large, well ventilated and the cement floor kept perfectly clean. Every morning the attendant passes through all the houses and, with tray and broom, collects all droppings, when clean sand is again scattered.

The larger runs are given over to the single comb White Leghorns. Of these there are about 250 birds, and from them are secured most of the eggs for the Potter, which gets its supply of eggs from Captain Mitchell. There are some pens of beautiful Barred Rock, Buff Orpingtons and Brahmas. The cuts in this page give something of an idea of this stock and the houses.

The houses, by the way, and the appliances about the yards, have many suggestions. The cut of the houses show the substantial construction. The "jail," which may be seen at the end of the house, is on every house. As soon as a hen gets broody she is removed to the jail and after two or three days by merely pulling a wire the birds are released into their regular quarters.

At the time of the visit—Jan. 20th—no hatching was begun, nor were eggs being delivered for hatching. Yes, the Captain does some selling of eggs for hatching, for his desire for fine stock has brought together such a lot of birds as commends admiration and consequent desire for the eggs at hatching time. No pullets are in the breeding pens. Only hens which have moulted, or hens in their second season. All early orders this year have been refused, for the Captain said his eggs must not only be fertile, but capable of producing strong constitutioned birds which will be money makers.

The incubator and brooder were not yet started, but the best of appliances are on hand for that work this season.

Two gasoline engines are on the place, one for pumping water for use in the garden, in the house and for the poultry, and another for charging the storage battery in the automobile. But together to give information on poultry raising in California.

The Captain says that he ascribes his success to the fact that he started in with nothing to unlearn. So the book is entirely from a California standpoint.

It shows how the place has been brought up to yield the neat income of $1500 per year for its commercial product. And all on only five acres.

This book will be issued within a very few weeks and will be on sale at the Cultivator office. The novice will find much of instruction in it, the veteran poultryman will get a vast fund of new ideas. Captain Mitchell is a keen observer of the best ideas to be secured from others and from practical experience.

In his preface he says:

"At sea a man is considered to have no time absolutely his own, but is liable to be called on at any moment; he expects this before he ships and is therefore prepared for it.

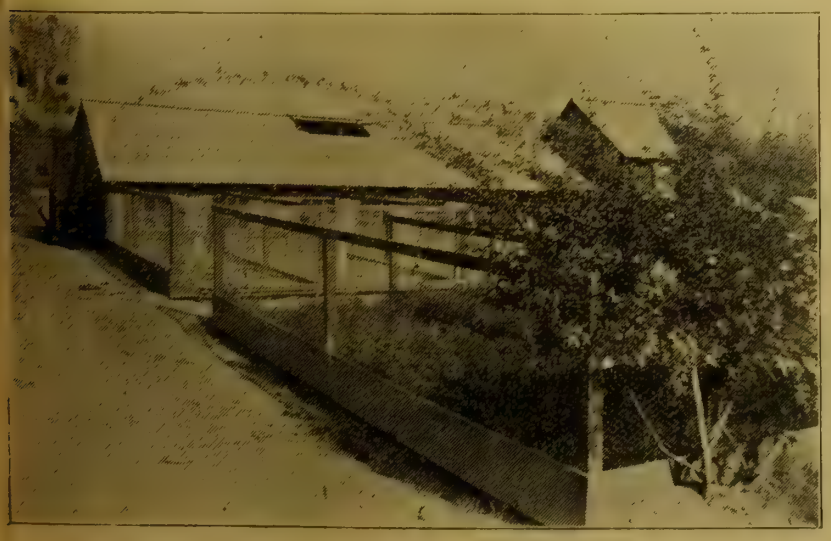
This same rule applies to the poultry business, so unless one is prepared to give up a good deal of their "watch below," Sundays included, it were better left alone, for if one gets tired of it in a year or so, much of the investment is likely to be lost when selling out.

In case a reader of this book intends to take it up seriously, and requires more information on certain points, the writer will be glad to hear from him."

In the introductory, after reviewing the first four years' work, he says:

"The fifth year is now at an end. My sales have been about $3000. The food has cost $1200, and labor $500; I am therefore $1300 ahead by the year's work. Had I employed one boy instead of two, and done some of the manual work myself, I could have netted a clear $1500. I have learned more this year than I would have thought possible, and still think I am going to learn something new each year about chickens, as long as I continue to raise them. I know more today than I did five years ago, but I am a long way from being an expert. I am simply a practical man, running a poultry plant on strictly business lines, under conditions suited to this climate, where poultry grows more slowly than in a country where there are fixed seasons, where feed is dearer than in most parts of the United States, and where the cost of labor is almost prohibitive.

This little account of my work makes no pretence of being a complete manual of poultry raising. There are plenty of excellent works of that kind already on the market, some of which I shall have occasion to mention later on. I am only trying to give a plain statement of facts about poultry raising in Southern California, where conditions are essentially different from those that prevail in the East. The knowledge that I have now would have saved me much time and money if I could have availed myself of it at the start; and it is with the hope of saving other beginners from similar errors that I am offering this record of my experience."



Brooder House and Pens.—Note that the alfalfa pens in the foreground are cut off from the main run. But the gates may be opened and the chicks allowed to run in alfalfa when wished.

NOTES BY THE WAY.

These notes were written for last week's paper and croweded out. Since then the rain has materially altered the feeling of the people of the coast.

Dry weather?

Yes, a little bit. Pretty discouraging to some. Yet a trip up the State by one of the Cultivator staff shows not all discouragement. The stockmen are blue and looking for new pasture. That is, most of the way from here to San Francisco, along the coast. At Santa Barbara the hills are yet brown, but the orchards are receiving cultivation and irrigation.

Captain Mitchell finds plenty of water for his chickens—but that's another story, which appears in another column.

At San Jose the dry weather and the disposal of the old prune crop vie with each other for first place in the conversation.

The prune question is no joke. There are yet on this coast 45,000,000 pounds of prunes. Most of them are in Santa Clara valley. That means a vast property tied up which growers up that way wish changed into coin of the realm.

The growers' desire, it is believed by many, would be, in a measure at least, secured so far as the market is concerned. But there is where the cussedness of man comes in and the bearing and ruining of the market is engaged in.

The price of three cents was no sooner made by the associations and independent growers than a two and three-quarter price was made by one of the largest outside shippers. The meanness of such a movement is commented on by growers in no genteel language.

But this isn't prune review, but just Notes by the Way.

Above San Jose, toward San Francisco, through San Mateo county, the grass becomes more green, and over on the ocean side plenty of rain has fallen. That is, they say a "plenty," but at the same time admit a "leetle" bit more would do no "harm." In San Francisco we met Captain Thornton, who owns a fine property—a whole section of land—just outside the city limits, which is covered with cabbage and other garden truck which are all grown without irrigation.

Wishing to know the price of such land we asked the cost and the Captain said it cost him $1.25 per acre.

This was interesting.

Was there any more land at such a price?

The Captain said there was lots of it when he took that up.

That was more interesting. But it soon developed that that was in '50 or many years before the writer began counting birthdays, so interest ceased. The land is now worth $400 or $500 per acre.

North of the city, up in Marin and Sonoma counties, the hillsides are green and cattle browsing in contentment. Here, also, a little more rain would do no harm. However, no great suffering is apparent and plows are going on all sides.

Up in Petaluma are some chickens. But that, too, is another story, for next week.

Out toward Sacramento we cross the great ferry boat Solano, of the Southern Pacific company, on which two trains look lonesome. We then cross some of the rich tule lands of the delta of the two great rivers. Some of these lands have been reclaimed and are today the richest of the State. And others are yet open for the enterprise of the capitalist, who will, with dredgers, throw up levees and reclaim more of it from the sea.

Rain? No. No one there cares for rain, for the gardener simply opens the gates and lets in rivers of fresh water.

The Sacramento is not flowing full, yet a vast quantity is floating the river boats with their valuable freight.

Between Sacramento and Stockton is a magnificent section. Orchards, vineyards, grain fields and gardens. Off to the west are many reclaimed lands which are irrigated from the rivers. Others, especially gardens, are irrigated by windmills.

One of the most valuable tracts of this reclaimed land is in the hands of a Los Angeles syndicate, which is securing the vast worth of this land, and at this time has seven dredgers at work throwing up levees and reclaiming many thousands of acres.

In the grain sections much plowing is being done, and more rain would be a great blessing. South of Stockton it's pretty dry. The great section between this and Fresno is hardly touched by the plow. The teams are idle and the farmer looks into the blue and says, "How long?"

At Fresno the raisin men are talking raisins. Raisins to burn. Of the million pounds of raisins only about one-half has been marketed. That, of itself, is not discouraging, but the contentions within the ranks is fearfully discouraging. The management in charge of the association have made some mistakes, possibly, but greater have been made by outsiders who have dogged every step of the management to the end that the market is demoralized.

The new schedule of prices with the assurance that the price will not be lowered this season is expected to strengthen the market and enable the disposal of the remainder of the crop.

Geo. C. Roeding looked over from behind a pile of mail just in and said "too busy to talk to newspaper men," and he looked it. Shipments of nursery stock going everywhere. "Drouth? Yes, a little dry, but lots of trees being planted."

F. H. Wilson, of Fresno nurseries, had a yard full of fine looking trees. Most of his large shipments go out from the Dinuba yard direct. Mr. Wilson wished it would rain, but had no complaint. Lots of trees going out.

The big Fresno Agricultural works is prepared to meet a heavy demand for the tools to work the ranch, and many men are busy in the shops with orders now being filled.

The stock men of the State are the most inconvenienced by the lack of rain, yet the general condition is not so desperate as many believe. One seldom hears a discouraging remark, as nearly all say it will rain yet.

COLTON MARBLE.

The Colton Marble Works, which is now the property of the California Portland Cement Company, and which has been running day and night for the past two years furnishing marble for two of the finest office buildings in San Francisco which cost their owners more than $1,500,000.00 and which are now completed, is now running and is ready to furnish marble of all descriptions to whoever desires.

The Colton marble is one of the most beautiful marbles in the world, takes an exceedingly high polish and does not stain.

The company invites the public to inspect their plant at Colton; and anyone using marble has no need to go abroad or east for same, for they can save time and money, besides getting a superior article at home, and thereby helping to build up a new industry for Southern California.

THE ELGIN FACTORY.

The Elgin factory is the largest in the world. The daily output is 2,000 watches, and 102 different kinds are manufactured. The watches go to every part of the world, and are sold even in Geneva, Switzerland.

The different parts of a watch are manufactured in different departments by different people, who have devoted their lives to that particular kind of work, and have been trained to delicacy and exactness which is more important in watchmaking than in any other mechanical industry. These parts are then assembled as they are needed in another department, where they are put together by experts, who handle them as easily and almost as unconsciously as a great pianist will strike the keys of his piano.

If a father is able to start his son in business with $10,000, what business is as safe as farming? asks William J. Bryan in an article in the January Cosmospolitan. Given a young man with a thorough education, good habits, willingness to work, and a desire to make himself useful, where can he fare better than on a farm? He can apply his brains to the enriching of the soil, to the diversification of his crops, and to the improvement of his stock, and at the same time give reasonable indulgence to his taste for reading and study. He will have all that contributes to health of body, vigor of mind and to cultivation of the heart. What occupation or profession can offer him richer rewards?

The California raisin-growing industry, like all other industries of the State, shows enormous development, which but indicates the possibilities of the future. In 1876, but 600,000 pounds of raisins were produced in the State. By 1894, the production had reached 103,000,000 pounds. Then came four years of depression, which was felt by practically every enterprise in the State. But in 1898, in common with other California industries, raisin-growing took a fresh start, and last year the yield was estimated at 115,000,000 pounds. Increased production from now on promises to be steady. With better distribution there will be little difficulty in disposing of all the raisins that California can produce, and 115,000,000 pounds will probably be small in comparison with the figures setting forth the volume of the raisin crop ten years hence.

THE "BOSS"
TREE PROTECTOR
Made of Yucca Palm

Is cheap, durable and quickly put on the tree. It prevents Rabbits from destroying your trees. A sure protection against frost, sun-burn, grasshoppers or dry winds. can be easily removed; will last for years.

FARM SEEDS

We are the largest farm seed growers in the world, operate over 5,000 acres. We have made it a life work to increase the yield of cereals and grasses and potatoes, and have succeeded in an astonishing degree. Here are some sworn to yields per acre:

Salzer's Beardless Barley	121 bu.
Hanna or Arid Land Barley	75 bu.
Home Builder Corn	304 bu.
Salzer's Three Eared Corn	260 bu.
Salzer's New National Oats	310 bu.
Salzer's Speltz or Emmer	80 bu.
Salzer's Great Teosinte Fodder	80 tons
Salzer's Victoria Rape for Sheep	30 tons
Salzer's Billion Dollar Grass	14 tons hay
Salzer's Alfalfa Clover	7 tons hay
Salzer's Bromus Inermis	7 tons hay
Salzer's Potatoes	400 to 1,000 bu.
Salzer's Onions	1,000 bu.
Salzer's Rutabagas and Turnips	1,000 bu.

FOR 10c. IN STAMPS

and the name of this paper, we will send you a lot of farm seed samples, including some of above, together with our mammoth 140 page illustrated catalog, all for 10c. in postage stamps.

JAMES WATERS, Prop. Watsonville, Ca

TWILIGHT ON THE FARM.

The dews come down, and shadows gather
in field and lane,
Low in the west a band of black gives
promise unto rain,
It is the twilight hour—and given o'er to
calm and rest,
It brings to home a benediction and is blest.

The boys come and bathe their faces at the
cooling well,
Afar and faint, then near and sweet, tinkles
the lead-cow's bell,
It is the twilight hour—and stars are start-
ing from the deep,
High heaven's herald sent to watch that
men may sleep.

The father comes, a man of many years of
toil and care,
Who smiles to see the candle in the self-
same window there;
It is the twilight hour—and with the farm
work amply done
He feels a poor man's joy to think the food
is won.

Then all sit down to eat the evening meal,
and far away
A wagon rumbles out the neighbor's name
who loves delay;
It is the twilight hour—and free from day's
unending quest
It brings to home a benediction and is blest.

—Boston Journal.

THE LAST OF NINA'S LOVERS.

"You won't find her that way."

Sheldon stopped on the path to the cottage and looked back. There was an old half-sunk pier at Dexter's Landing. One side sloped almost to the water, but the other was high and safe on its piling, stained green by the lapping river.

A figure in pink was perched at the far end of the pier. Nina never wore pink. She said it was ordinary. Nina's gowns were all in pastel tints. Also, the figure wore a large sunbonnet. Nina said that sunbonnets were ordinary, too, and topped her own pretty blonde curls with an airy creation in chiffon and tea roses.

Therefore, taking these points into consideration, Sheldon waved his cap in comrade fashion at the figure, and started for the pier.

"Don't whistle rag-time," said Sally, severely, when he was beside her. "It fidgets the fish."

"I don't see any fish," he returned, mildly.

"There are lots and lots. If you keep looking steadily at the water you can see them. I just saw a great big perch come along, and he chewed my bait right off, and sailed away with it. Fish are the meanest, smartest things you ever saw. Want to fish?"

"Not today, thanks, Sally."

"Oh, I forgot. You want to find Nina. If you go down past the boathouse, up the board walk to the hotel, then over the beach—"

"It's too warm to travel," said Sheldon. "I'll fish. Lend me your pole."

Sally watched him thoughtfully, as he rebaited the hook and cast out with a broad sweep.

"Fishing's awfully soothing, when you're worried," she said after a time. "You have to keep still, anyway, and the water makes you so sleepy and rested when you hear it lapping against the pier."

"I'm not worried, Sally."

"Yes, you are. Of course you don't notice it, but everybody else does. And I'm awfully sorry for you—about Nina, you know." The white sunbonnet nodded at him sympathetically. "You really havn't the ghost of a chance. You know Harry Barton and Wallace Stevens and old Mr. Dean? They all had it, too. Wallace had it worst. He wanted to jump off the lighthouse pier until I told him Harry and Mr. Dean had chosen the same place, and he changed his mind. They all tell me about it, you know, because I'm her sister. I can tell when one's in love with her before she can. First they give me candy and loan me their "frat" pins, and say I'm a bully chum. Then after a while they say they wish they had a sister like me. Then they want me to tell them all about Nina ever since I can remember, and I fill them up."

"Fill them up?"

Sally nodded contentedly. "Tell them a lot of fairy tales about how lovely she has always been, and how she saved my life three or four times, and never told a lie, and won't use powder, or curl her hair on an iron, or anything. And they keep on liking me until Nina lets them fall over, and after that they come and I sympathize with them, and they tell me how they would like to die. It's awfully interesting. Will you take to the pier when Nina lets you fall over?"

"I'm not in danger of taking a tumble, thank you, Sister Sally."

"Oh, don't be morose and grumpy. It's a sure sign you're worried. And it's nothing at all to be ashamed of. Nearly every one falls in love with Nina. It's part of their vacation, Wallace says. And she doesn't mind, only she says she does wish they'd all propose by moonlight, as it's more effective and interesting."

"Did any one ever propose to you, Sally?"

"Oh my, yes. And it was lovely. Last year—no, two years ago—I was eleven, going on twelve, and the Seventy-second Regiment came down here to camp. And there was a bugler boy. He was going on fifteen. He wasn't very pretty, but you know how they look all dressed up cute, and he could blow the bugle so it said 'Sally.' And he used to write me notes, and hide them in trees, and after supper we'd sit on the porch and talk and talk, just the way Nina does. And the night before he went away he proposed."

"What did he say?"

Sally hesitated and her eyes were tender. "Don't you laugh and tell Nina?"

"Never."

"Cross your heart, hope to die, if ever you tell you'll lose your eye," chanted Sally.

"Which eye?"

"You're laughing now. I don't care. He was a lovely boy. And he said, 'Sally,' let's run away, and never come back any more.' And I said, 'No; I'm sorry to hurt your feelings, but I never will forget you or the honor you have done me as long as I live.' That's what Nina always says. And then I let him kiss me; and he wanted a lock of my hair, so I cut off a piece of Nina's long curl that she tacks on the back of her head when there's a hop. It wasn't just the color of my hair, but he didn't know, and that's what Nina does when they all beg locks of her hair. Why she wouldn't have any left at all, you know. And then I let him kiss me a few times more just to let him know I was really and truly sorry, and he went away. You've got a bite!"

Sheldon did not notice the bobbing cork. He was staring at a white sail that dipped blithely to the breeze at the north end of the island.

"Isn't that Creston's yacht?"

"The White Ladye? Yes, that's his." She looked at it attentively and sighed. "It's just as well you didn't hunt Nina, because she's out there. Creston's splendid. He's got money, too; but that isn't it. I know Nina's in love with him, and it will all be fixed when they come back. I'd never let anybody propose to me on a yacht. Just get nicely started and have the sail flap at you, or something. And no one can handle a yacht when there's proposing, can they? Isn't she going a little topply now?"

Sheldon said something beneath his breath, and turned back to the contemplation of the cork.

"But Nina won't mind this time. I guess you don't mind anything when you're really in love. He's going South tomorrow if she doesn't say yes. He told me so, and I told Nina last night.'

"They have veered around, and are heading for the pier."

"Maybe the bay is rough. You'll never catch a single fish if you bob like that. Maybe I ought not to have told you, but you're the only one of the whole lot that I like, and when I told Nina you were in love with her—that was after you gave me the fishpole, so I knew—and that I wished she'd marry you, she said you were taller than Creston, and a dear boy. And one day I found her crying, and asked her if she was in love, and she threw a pillow at me. And then I asked her if it was you, and she threw two pillows at me. But when I said Creston, she just kept still, and cried, so I knew. They are coming this way."

"Do you think she'll take Creston?" asked Sheldon, looking up.

"Oh, yes. I asked her, and she laughed, and said if she didn't marry him she'd accept the last man who proposed. I wonder who that was. Wallace did last Sunday night, but Nina would rather try the lighthouse pier herself than take Wallace."

Sheldon took one last look at the white yacht bearing down upon him, and suddenly devoted all his attention to the fishpole. There were three impaled beauties to his string when the White Ladye slipped gently along the pier, and when he caught the rope that Creston threw, he was smiling almost cheerfully, and Sally took heart. Nina was cool and sweet in white duck barred in blue, and she smiled back at him as he helped her to the pier.

"Coming, Creston?" he asked.

Creston shook his head, and he raised his cap to her. Sally saw that his face wore the same look that had been on Barton's and the rest when Nina had finished with them; but the hand that held the white duck skirt from contact with the wet sides of the pier wore a single diamond ring and Sally pondered.

"I am going back to the clubhouse," said Creston. "We sail South tomorrow."

When he had gone Sally looked anxiously at Nina. She was smiling dreamily at the retreating yacht.

"Nina"—Sally's tone was low and regretful—"is he really going?"

"Really and truly. I think he is heading for the lighthouse pier this minute—"

Sally reached for the fishpole, which Sheldon had cast aside, and threw out the line carefully.

"Well, I'm sorry for the last one, then," she said.

Sheldon raised a parasol over Nina with proprietary interest, and shut off the view of the yacht as he kissed her.

"Pity me, Sally," he said, "I'm the last one. We were engaged last night."

Sally turned back tactfully, and the white sunbonnet was mirrored in the water.

"Do it again, if you want to," she said gently. "I won't peek. Only go away, or you'll scare the fishes."—Izola L. Forrester in Woman's Home Companion.

RECIPES

Eat Little, but Have That Little Good

PRUNES.

Prunes, which are the dried fruit of a certain kind of plum—a sweeter variety than the ordinary Davison or Green Gage plum—belong to that class of fruit known as food fruits. Dates, figs, raisins and prunes—the "stone fruits"—contain 50 to 75 per cent of sugar, and are considered to surpass even the banana as a source of cheap nourishment. Then, too, they have this advantage over the banana, they are generally more agreeable to every one when they are cooked, and may be employed in a greater number of delightful combinations. Prunes and rice form a delicious consortment, the rice furnishing the carbohydrates.

The laxative quality attributed to the ordinary prune is greatly overrated, as it does not contain qualities which cause it to be more laxative than other fruits. This idea probably had its origin in the fact that a special kind of plum is grown in southern France, which is rather indigestible, and which forms, when dried, the medicinal prune.

Prunes, grown, ripened and sundried in our favored western climate, are very sweet and very fine.

They should be thoroughly stewed, but slowly and at a moderate heat, in order to make them tender and develop the natural sweetness. If the cooking is carefully and properly done the finest grade of prunes do not require sugar added as additional sweetening.

Prunes should be thoroughly washed in cold water and soaked over night

Traveling on the "Limited"

Is a necessity with many business men, to whom time is money.

To many others "The Limited" is attractive on account of its exclusiveness, fast time and fine appointments. They willingly pay for the luxury and elegance found on this suberb train. It is the standard of excellence in railway service.

Which way? Oh!

Santa Fe

Tours

To foreign lands are not enjoyed half as much as a day spent at the ocean beaches on the line of the

SALT LAKE ROUTE

Magnificent Mountain and Marine Views greet the eye on every side. The climate is superb. The Fishing, Yachting, Boating, Bathing, Golfing, Driving are unexcelled. No finer beaches are found than LONG BEACH, CATALINA ISLAND, TERMINAL ISLAND and ALAMITOS BEACH. They all offer good hotels and boarding places at reasonable rates.

Information and tickets may be obtained of Salt Lake Route Agents.

Nobby Sack Suits

The new loose-cut sacks, designed for men who want to keep a little ahead of the procession, are either very swell or the reverse—depends on how they're tailored.
Ours will bear the most critical inspection of men who have the custom-tailor habit—the quality of the cloths, the character of the cut, the careful, painstaking tailoring are above reproach.

$15 to $37.50

in sufficient lukewarm or cold water to cover them well, allowing for their swelling to their original size when fresh.

When the skins of cooked prunes are tough and hard they should be removed before the fruit is given to children or delicate persons, and in all cases they should be thoroughly masticated before swallowing them.

Prunes which are cooked until they are plump, sweet and luscious are not to be spurned by the most fastidious, who may have had the misfortune of a first introduction to this branch of the plum family after it had been subjected to the not unusual shriveling, toughening process which has made them a byword and subject for cheap witticisms.

* * *

Prune Pudding.—Stew until tender one pound of prunes which have been soaked over night; when cooked add sufficient granulated sugar to sweeten to taste. Remove the pits and cut the prunes into small pieces. Beat the whites of eight eggs to a froth and stir them in gradually into the cold prunes, beating all the time. Bake at once, about twenty minutes. Stir the pudding once while cooking. Serve with whipped cream. This makes a large pudding.

Prune Jelly Pudding.—Simmer gently large, finely flavored prunes until tender, being careful to keep the skins from breaking. Drain free from the syrup and place in a pretty glass dish. Break up a mold of lemon jelly and place in and about the prunes to give it the appearance of having been made together. Whip one pint of cream stiff with half a cup of powdered sugar, flavor with a teaspoonful of vanila, pile over the pudding and set away to get very cold.

Prune Loaf Pudding.—Stew half a pound of prunes which have been well soaked until tender; soak half a box of gelatine in a cup of cold water. Strain the juice from the prunes; there should be two and a half cupfuls. Pour this juice over the gelatine and half a cup of sugar. Add the prunes, together with the meats taken from the prune pits, both should be chopped fine, and the juice of half a lemon. Pour into a mold which has been wet with cold water; set away to harden. Serve with whipped cream.

Prune Roll.—Add to one quart of sifted flour three teaspoonfuls of baking powder and half a teaspoonful of salt; sift these again, then rub in with the tips of the fingers two tablespoonfuls of butter, add sufficient milk to make a soft dough. Roll out, and sprinkle with one cup of prunes which have been cooked until tender, and from which the pits have been removed and the prunes cut into small pieces; dust with a little cinnamon. Roll up and steam for half an hour. Serve with hard sauce.

Prune Cream Pie.—Stew gently sufficient prunes which have been soaked over night to make one cup of pulp. Stone and mash the prunes through a colander. Add to pulp one cup of thin cream, thickened with a teaspoonful of cornstarch which has been made smooth with a little cold milk, add one-third cup of sugar and the yolks of two well-beaten eggs. A little lemon or orange juice may be added to flavor and greatly improves the pie. Line pie plate with pie crust, fill with the prune mixture and bake as quickly as possible without burning. Beat the whites of the eggs stiff and stir in two tablespoonfuls of powdered sugar, and spread over the pie when taken from the oven; return to the oven and brown lightly. To be eaten hot or cold, as preferred.

ONE WAY TO BE ATTRACTIVE.

The housekeeper has many things on her mind, but she should not neglect giving at least ten minutes out of every twenty-four hours to her own personal attractiveness. Every boy and girl thinks "mamma" is beautiful, and why should she not be universally admired, even though not beautiful by nature, if her appearance shows she has taken care of her complexion? Every night, just before you retire, try washing your face with good soap, rinsing and drying well, then rubbing with a solution made of two parts of rose-water, one part of glycerine and the juice of two lemons. Have enough altogether to make one pint. Put just enough on to make the face moist, and rub until the skin is rosy red. If there are any wrinkles around your eyes or mouth, be careful that you do not rub parallel with them, but straight through, crossing them. The effect will surprise you. The freckles, tan and wrinkles will gradually grow dim, leaving a soft pink-white smooth skin.

BY ERNEST BRAUNTON, GLENDALE, CAL.

INSUFFICIENT INFORMATION.

Editor Cultivator: Our rose bushes are not doing well—leaves are curled—do not seem to have any insects on them. Can you inform me what is wrong?—Mrs. E. E. F.

If you will let us know: What soil plants are in; what the water supply; how fertilized, if at all; how old bushes; what varieties, if known; what exposure; if in lawn or in plat by themselves, and any cause you can think of for the trouble, we will try to help you, though no assurance of help can be given. The fact that leaves are curled gives us no light—we need all facts obtainable.

* * *

FERNS.

Editor Cultivator: Please answer following questions: 1. What kind of soil do ferns thrive best in? 2. Where can I sell cut ferns? 3. I enclose piece of fern leaf covered with scale; what shall I do to remove or kill it?

1. Leaf mold—pure, or about one-fifth sand if rather heavy. 2. Address San Francisco and Sacramento floral stores; we have no addresses of such on hand. 3. Too badly infested to preserve leaves; cut all off; clean off every scale seen on stump and wash once or twice a week with strong soap suds, or until sure all scales are dead. Keep soap suds out of soil as much as possible.

* * *

DROUGHT-RESISTANT TREES.

Editor Cultivator: Please answer following questions: 1. What shade trees, ornamental trees, and palms can stand the most drought? 2. What shrubs and flowering plants are the most drought-resistant?—T. H., Vernon ave., Los Angeles.

The following trees are all good for very dry situations and all but the pine and cypress will do for street planting. Any acacia except melanoxylon (the Blackwood), Ceratonia Siliqua, Carob or St. John's Bread (see two S. W. Main and Fourteenth), Cupressus macrocarpa, Monterey cypress, Eucalypti ficifolia, or rudis; the first is the scarlet flowering gum; Pinus radiata, Monterey pine; Sterculia diversifolia, Victorian bottle tree—best of all for streets; last, but not least, the live oak—plant one or two somewhere.

No doubt Washingtonia, the California fan palm, is the most drought resistant. The writer has seen them in their native habitat, growing well up the canyon sides where no soil was visible, nothing but rocks. No doubt the roots reached water somewhere, though, when young, they certainly could not.

In shrubs the following are useful: Caesalpinia pulcherrima (known locally as "Bird of Paradise"); Grevillea Thelemanniana (a jewel); Lantana, several colors; Lavetera, either species in market; Plumbago, white or blue.

In small plants use: California poppies, lavender, mignonette, petunias, portulaccas, rosemary, smeet alyssum. Lists containing other plants for dry localities have appeared in these columns from time to time—memory will not keep a readily available list of all that are best for the purpose.

* * *

SICK ROSES.

Editor Cultivator: I send by same mail roots and canes of diseased rose grown by me from cutting two years ago. First year it did fairly well, but this year it has gradually died back. Many others are going same way—they sometimes die on one side of wood only, while the opposite side is green. Soil is fairly heavy, containing some sand and gravel. Have tried soot, sulphur, ashes and soap suds as remedies, but they seem to do no good. Can you suggest a remedy?—Mrs. Halford, Dinuba, Cal.

From material and information sent no correct diagnosis of the trouble can be made nor specific remedy suggested, but the writer begs leave to submit the following comments: The plant sent was very small and poorly rooted for a two-year-old and the cuttings had been improperly made. The lower cut was made too far below a bud and the subsequent root growth was "sporty," that is it all went in one direction, as is quite common with cuttings so made. So long was this wood below the bud that it does not appear to have callused, but the pith or center rotted out clear to bud—such a rose never had a fair start.

The sand and gravel in a soil that is only "fairly heavy" is no advantage—roses like a firm soil. Ashes and soapsuds are certainly not good for rose bushes that are sickly. Wood ashes are generally beneficial to healthy, growing plants, but soap suds never are. Rose wood dying one side only, might be due to sunburn in cases where the heat was great and little foliage to shade the canes, but it is much more apt to be a die-back, or anthracnose, for which no cure has been found. The symptoms given point strongly to this disease. La France, locally, seems to be more readily affected than any other rose. We are sorry we cannot help you, but would advise burning up all affected plants and starting anew.

PICKLING OLIVES.

If the Cultivator can send me a reliable recipe for pickling olives with lye, it will be conferring a greatly appreciated favor upon an old subscriber. Several years ago I pickled olives, using lye, with great success, but the recipe I used can not be found now and so I appeal to the Cultivator. Trusting that I am not appealing in vain, and thanking in advance, I am, very truly yours, James M. Park, El Montecito.

On page 162 of the Cultivator of September 4, 1903, will be found an article answering the question asked by correspondent.

Genl. Otis Praises the Santa Fe "Limited"

"I have been for years a casional traveler, east and west, on the Limited trains of the Santa Fe System, and it gives me pleasure to bear voluntary testimony to the excellence, the efficiency and comfort of the train service, and to the unvarying excellence of the dining service, both aboard the trains and at the various stations along the line. Even at desert eating stations I have found the food and table service entirely satisfactory and far above the average."

Brig.-Gen. Harrison Gray Otis
President Los Angeles Times

Hundreds of others enthusiastically endorse the California Limited. Go thou and do likewise.

BAKER'S

TRACELESS HARNESS

No Whiffletrees—No Traces

This harness is indispensable to every fruit grower—vineyardist or orchardist. Saves time, labor and patience. Pays for itself many times over every season in the saving of injury to trees and vines and damage to growing fruit, which always occurs from the use of ordinary whiffletrees and traces. One of the handiest of farm equipments.

We have hundreds of testimonials from every State, like the following:

Sunland, Cal., December 27, 1902.

SIRS—In regard to the Baker Traceless Harness which I purchased from you I wish to state that when using it on the team among my trees, I know of no improvement which can be made on the outfit unless I cut the legs off the horses. It is impossible to injure the trees or fruit while using it.

Yours well satisfied, T. G. CUSHMAN.

Sebastopol, Cal., March 29, 1902.

DEAR SIRS: Your harness is all you represent it to be in every particular. We judge it a big success for plowing vineyard and orchard.

Yours very truly, C. D. HAMILTON

Don't delay—write us to-day for illustrated catalogue of this valuable harness, mailed free for the asking. Live agents wanted everywhere.

WOODIN & LITTLE 312-314 MARKET ST. SAN FRANCISCO, CAL.

Los Angeles Markets.

Los Angeles, Feb. 11, 1904.

Although there is no change in price of eggs from last week there has been much doing in that line, the last few days. San Francisco market became crowded, causing a drop of 2c, thereby throwing an unusual quantity to Los Angeles, supplying the demand, which, for the past two weeks, had been greater than the supply.

All feed stuff has taken an advance of 5@10c over last week's prices, owing to the continued scarcity of rain. Fruits and vegetables are all firm, with the same prices as heretofore quoted. Lower grades of butter have been quite active the past week.

San Francisco Markets.

Dairy.

The market for lower grades of butter has been easy during the week but higher grades have been steady at ruling prices.

Creamery, extras	30
Creamery, good to fancy	27 @29
Dairy, extra	25 @26
Dairy, choice	22 @24
Store	14 @16
California Storage	21 @24

Eggs and Poultry.

Receipts of eggs have been the heaviest of the season and as a result prices have maintained an easy undertone.

EGGS—Per doz:

Ranch, selected, large	27
Ranch, good to choice	25 @26
Store	24 @25
California storage	Nominal
Eastern	Nominal

The market for poultry has been excellent, good demand, firm prices. No material change from last week's quotations.

Fruits and Vegetables.

Navel oranges show a stronger tone this keew owing to the uneven prices.

DECIDUOUS FRUITS—Apples, per box, common to choice, 50c@$1; fancy, $1.25@1.75, extra, $2.

Pears—Per box, Winter Nellis, $1.75@2.

CITRUS FRUITS.—Per box: Oranges, Navels, fancy, $1.25@2.25; choice, 65c@$1.50; standard, 50c@$1, according to size; Seedlings, 50@90c; Lemons, $1@2.50; extra, $2.75; Grape Fruit, $1.50@2.75; Tangerines, $1@1.50; Limes, $5@6.

The tone for potatoes continues firm, some movement in speculative channels. Vegetables somewhat easier tone.

VEGETABLES—Asparagus, per lb., 40c; Tomatoes, per box or crate, southern, $1@1.25; Rhubarb, per lb., 8@10c; Green Peppers, per lb., 12½c; Dried Peppers, Stockton, 5@8c; southern, 8@12½c; String Beans, per lb., 12½@17½; wax, 10@12½; Green Peas, per lb, 5@7c; Egg Plant, per lb., 20c; Summer Squash, per box, $1@1.25; Cucumbers, hot house, per doz., 50c@$1.50; Mushrooms, per lb, 50c; Garlic, per lb, 5@7c; Dry Okra, per lb., 12½c; Marrowfat and Hubbard Squash, jobbing at ½@1c per lb.

POTATOES—Per ctl: River Burbanks, 95c@$1.10; Early Rose, 90c@$1.05; River Reds, $1@1.10; Garnet Chile, 90c@$1.25; Salinas and Lompoc Burbanks, $1.40@1.65; Oregon Burbanks, $1.10@1.35; Tomales, $1.05; Sweet Potatoes, $2@2.10.

ONIONS—Yellow, per ctl, $2.

Dried Fruits, Nuts, Etc.

Interest is lacking in general trading in dried fruits and the market is tame, as it was last week. This condition, however, does not obtain in New York, for within the past few days the apathy which has characterized the attitude of most buyers of dried fruits has disappeared, and while pronounced activity is still lacking, the movement shows a decided improvement compared with what has been doing in this line since the beginning of the year. The incentive to speculation appears to be less than for many years at this time, and transactions therefore reflect for the most part only the passing requirements of distributing trade. The movement of stocks into actual consumption now appears to be in full swing, and the outlook is for the continuance of it well into spring, as retailers, like jobbers, have, to a much less extent than usual, anticipated their requirements, and consequently are likely to be steady buyers on the present scale, so long as the consuming season lasts. The effect of the demand from consumers is now being felt in the wholesale market east, and it is reasonable to suppose will reach the Pacific Coast within a short time. At present prices remain about as quoted last week.

DRIED FRUITS.—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 3½@6c; Sun Dried, 3¼@4c.

Apricots—Royal, fancy, 9¼@10c; choice, 8½@8¾c; Moorparks, choice, 10@12c.

Peaches—Choice, 5@6c; fancy, 6¼@7c; peeled, in boxes, 11@14c.

Pears—Choice, 7½@8½c; fancy, 9¼@10c.

Plums—Pitted, 6@9c; unpitted, 2c.

Prunes—Four sizes, 60s to 100s, 2½@3c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Red, 4@5c.

Figs—White, 4@5c; Black, 4@4½c.

NUTS—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Pecans, 11@13c; Pinenuts, nominal. Peanuts, Eastern, 6@6½, do. California, nominal; Brazil, 11@12c; Filberts, 10@11c. California Walnuts, soft shells, No 1, 13@14; do, No. 2, 11@12c; hard shells, No. 1, 12@13c; do, No. 2, 10@11c; Hickory, 8@10c.

Chestnuts, Italian, 9@10c; Coacoanuts, $4.50 @5.00 per hundred.

HONEY—New Comb, per lb., White, 10@12c; Amber, 8@10c; Extracted Water White, 5½@6c; Light Amber, 5@5½c; Dark Amber, 4½@5c.

BEESWAX—Per lb., 26@28c.

Hops.

The price for the new crop is 27@30c per lb, according to quality.

Beans.

The market for beans shows firmness, prices on Whites a little higher.

BEANS—Prices per ctl: Large Whites, $2.45 @2.60; small do, $2.90@3.10; Pea, $3@3.25; Dried Peas nominal.

Live Stock.

Prices unchanged to any extent.

CATTLE—No, 1 Native Steers, 8½@9, and Stags, 3½@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 4¾@5½c, gross weight; heavy, 4¼@4½c, gross weight.

WHEAT—No. 1 Shipping, per ctl., $1.36¼ choice, $1.38¾; White Milling, good to choice, $1.38¾@1.50.

BARLEY—Choice, No. 1 Feed, $1.08¾@1.12½; off grades, $1.06½@1.07½; Brewing No. 1, $1.15@1.41¼; Chevalier, nominal at $1.20@1.40.

CORN—Good to choice, per ctl., California new, large Yellow, $1.35@1.40; small do., nominal; White, $1.35@@1.40; Eastern, $1.27½@$1.32½.

OATS—Good to choice White, $1.27½@1.40; Red $1.27@1.35; Black, nominal at $1.27½@$1.40.

RYE—Good to choice, per ctl., $1.30@1.32½.

WOOL.

There is no material change in wool.

Fall clip, per lb: California Plains, 6@8c; Foothills, 8@10c; Middle Country, 10c@12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

CHICAGO, Feb. 10.—Higher prices in all foreign markets, due to actual war, caused a strong opening in wheat. May was ¼ to ⅜ to ⅝ to 1 higher, at 95⅝@96, while July was ⅛ lower to ¾ higher, at 86¾@87⅝. Liquidation of aMy and buying of July by a prominent operator was the principal feature in trading in corn. The market was extremely erratic. May closed ⅝ lower, at 55¾@55⅝. There was a large volume of trading in oats, with heavy selling in May. The close was weak, May 1⅛ lower, at 42⅜. July closed ¼ lower at 38⅞. The feature was the transactions in May pork, which closed 5 higher. Lard was 7½ to 10 lower, and ribs up 2½ to 5.

Cash quotations were as follows: Flour was quiet, but firm; No. 3 spring wheat, 80@94; No. 2 red, 93¾@98; No. 2 corn, 49½; No. 2 yellow, 49½; No. 2 oats, 39⅝@40⅛; No. 3 white, 40@44; No. 2 rye, 62; good feeding barley, 40@41½.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	46,100	39,200
Wheat, bushels	79,000	49,200
Corn, "	295,600	198,900
Oats, "	514,600	173,000
Rye "	14,100	7.000
Barley "	191,300	30,000

DAIRY MARKET.

On the Produce Exchange today the butter market was firm; creamery, 15@25; dairy, 13½@20; eggs, firm, 28½@31½; cheese, steady, 9½@10½.

California Dried Fruits.

NEW YORK, Feb. 10.—The market for evaporated apples is quiet, but steady; common, 4@5; prime, 5⅛@5¼; choice, 5½@6; fancy, 6½@7. Apricots, are firm; choice, 9¾@10; extra choice 10@19¼; fancy 12@15. Peaches also are generally firm; choice, 7¼@7¾; extra choice, 7¾@8¼; fancy, 9@10. Prunes are quiet, at from 3½@6½ for all grades.

CITRUS MARKETS

THE ORANGE MARKET.

The largest orange sale of the season is reported from New York on Tuesday. The Agency sold thirty-eight cars and the Independents seven. The market has assumed a more energetic tone under the influence of higher temperature which permitted shipping from central points to outside towns. Prices were likewise higher and quotations firm. Florida oranges have about run their course and do not attract much attention at auction points. Only 150,000 boxes remain in the State. A better feeling pervades the market and the prospect is brighter, as the weather predictions are more favorable. Prices on Sicily lemons are from 10 to 15 cents higher than early in the week.

Only a Drop in the Bucket of what the

PERPETUAL HEN CO'S. Incubators and Brooders

Are Doing all Through the United States

The fact that old customers are increasing their orders this season from eight to ten times what they bought last season, is proof enough of the superior merits of these machines.

After a series of the most unreasonable tests to which a machine could possibly be subjected to, the result is, the sales of these machines are over twelve times what they were the last season.

Perpetual Hen Co. South Haven, Mich., June 6, 1903.

Mr. J. M. Sontag: Please find check for which send me 5 more brooders and nine more brooder fixtures to go into my graveyard brooders. Your brooders on my farm are giving great satisfaction—wonderfuly so—and your lamps are a pleasure to care for. Also send me seven lamps. In haste,

O. L. Hathaway.

Perpetual Hen Co: Harmonsburg, Pa., July 12th, 1902.

Mr. Sontag: Dear Friend—Send me eight more brooders, No. 2 and No. 3 Storm Kings, and nine brooders fixtures, to be put in my chicken killers. Your three brooders I bought of you last fall have done wonders for me. As I wrote I have six days in the week to care for my poultry and I find it a healthy occupation. I have always made a complete failure of the poultry business, yet would not give it up. My personal acquaintance with you when I met you in Oil City, Pa., struck me you to be an honest man, and I never regreted it, as I have time and again raised every little orphan, and your incubator has beaten the hens hatching, and your book on "Nature's Laws," Price, $1.50, is worth $5000 to me. Rush this order please. Yours.

Rev. F. D. Sutten,

Baywood Poultry Farm. Results above Guarantee. A Beginner with Incubators.

Mr. Sontag: I have raised all the chicks three times hand running with your brooder fixtures. I made my own brooders. I could write you a book on what I know of failures and drawbacks. I have lost a fortune once in this business, but since I heard of your book, three years ago, I am making money fast. As you know, I'm a total cripple; cannot use my lower limbs at all. I do all my work with a three wheeler, worked by a crank. Who says cripples cannot run an egg farm. I make a good living out of it. I want 100 more Rhode Island Red eggs. O. Lindberg, Laflin St., Chicago.

Do not fail to send for our 96 page Catalogue and Poultry Book combined

To any one that is interested in the poultry business it is worth hundreds of dollars. There is more information in it than any book of its size ever printed. Mailed on receipt of ten cents in stamps.

=200-EGG HENS=

And How to Get Them

Buff Orpingtons
Courtesy of Captain Mitchell,
Santa Barbara

You want 200-egg hens? Undoubtedly you do. There is a way to get them. In fact, you can make them out of your own flock of poultry. Why be satisfied with hens that lay only from 50 to 100 eggs per year, when you can have hens to lay 200 eggs per year per hen?

We have learned how to make 200 eggs per year hens and we can make your hens lay that many if you will GET THAT AMBITION and follow these instructions:

1st. Commence with the little chicks. They must be fed on the proper food to FULLY NOURISH THEM so that they can be developed into good layers later on. Therefore it is necessary for their future welfare that these chicks be fed on COULSON'S CHICK FOOD.

Now, of course, it is necessary also that you take good care of pour poultry at all times. Be sure to keep them clean and disinfect their houses with lice killer at least once a week. If you are willing to do this then you are willing to strive for 200 egg hens and we can help you with the SCIENCE OF POULTRY FEEDING.

2nd. The pullets and hens that you wish to develop into good layers and 200 egg hens: feed them a warm mash every morning of COULSON'S EGG FOOD. "No other kind is just as good." NO OTHER KIND is good enough; so if you want 200 egg hens it is necessary that the hens get COULSON'S food for then they get the PROPER FOOD.

At noon, at toward evening, feed the hens Coulson's Scratching Food (which is composed of wheat, corn, hulled oats, etc.) and give the hens plenty of green stuff and plenty of clean fresh drinking water, feed Coulson's food every day and you will develop a strain of 200 EGG HENS.

If your feed dealer hasn't got Coulson's Scratching food, ask him to get it for you. Send for circular describing it.

Many of the largest poultry farms in the county feed Coulson's prepared poultry foods exclusively and purchase it in car load lots.

Situated on the coast in Marin Co., overlooking the Pacific ocean is the 1000 acre ranch of John McDonald, who has, in connection with his dairy ranch, about 2000 hens which are being fed on Coulson's Egg Food. Only a few days ago we shipped him 200 sacks Egg Food and also 50 sacks of Chick Food to feed the thousands of little chicks which he is hatching out.

William Bassett, Tomalis; Geo. Gaston, Two Rock; and A. D. Rezendes, Tomalis; are other large poultry raisers who feed carloads of Coulson's feed.

You can get cheaper foods than Coulson's but they do not contain all the necessary articles and if you want to develop good layers and make the most profit out of poultry, feed Coulson's prepared foods; costs a trifle more than some other kinds but gives GREATEST RETURNS.

When you buy common feed you pay $24 or $25 a ton and it contains about 100 pounds of protein. Now, a ton of Coulson's Egg Food contains about 200 pounds of protein or in other words, there is as much protein (egg and flesh making substance) in ½ ton of Coulson's feed as there is in one ton of common feed. So you are making a great mistake if you don't buy Coulson's feed.

The season is now at hand when the majority of the poultrymen are hatching out chicks by the bushels and a great many are hatched to what sad end?

Have you ever stopped to think how many hundreds, perhaps thousands, of chicks you would have if these fine hatches would not die off so rapidly?

It is to our interest and our business to prepare a feed for little chicks so that the poultrymen can raise the most chicks possible and to have them grow fast and reach maturity quickly and be big, strong, healthy chicks, and we do not only believe, but we know that we have a Chick Feed that fills the bill perfectly and properly.

Only a few days ago we sent 30,000 pounds of this Chick Food to one party. Our Chick Food is used and recognized to be the best by the most thorough and up-to-date poultrymen and the largest poultry farms in California.

For instance, Purvine, Thoergesen, De Rezendes, John Marshall and others out in Two Rock valley, where the largest poultry farms in California are situated. These gentlemen all keep from 3000 to 7000 hens and they have to hatch thousands of chicks every year to keep up such large flocks. They have been in the poultry business for years and have had plenty of experience and tried all kinds of feeds and ways of feeding chicks, and they have now decided that hereafter they will feed Coulson's Chick Food exclusively until they get at least 6 weeks or 2 months old. They have found out that they can raise the most chicks and the nicest chicks on Coulson's Chick Food. These men use tons and tons of our Chick Feed.

Now, perhaps you will say that you are going to try a little millet seed or cracked wheat, rice or oatmeal, etc. But, my dear friend, don't you know that you can feed your chickens on Coulson's Chick Feed and it won't cost you a cent more and that in Coulson's Chick Feed there is a variety of 20 different kinds of grains, seeds, meals and containing everything not only to fully nourish the chicks and make them grow to be big, healthy fellows, but also contains articles that will check and prevent bowel trouble and other fatal diseases.

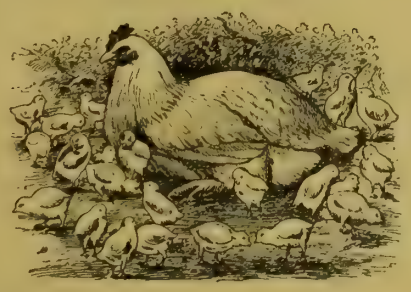
We are just in receipt of a letter from a poultryman in Windsor who says that he raised 550 chicks on Coulson's Chick Food and at the age of 2 months he sold the broilers for $3 a dozen on the place.

We have White Minorca chicks ourselves that are only 6 weeks old and weigh about 2 pounds apiece.

In conclusion, will say that for your benefit as well as ours we hope that you will raise all your chicks this year by feeding them Coulson's Chick Food.

It your feed dealer hasn't got it, send to us for it.

THE FEED
FOR
Little Chicks



$25 in Gold

We want pictures of chicks and hens that have been fed on Coulson's Poultry Foods and we offer $10 IN GOLD for the best picture of little chicks fed on Coulson's Chick Food.

$5 IN GOLD for the second best picture of little chicks.

$5 IN GOLD for the best picture of hens or poultry that are fed on Coulson's Food.

$1 each for the next 5 best pictures of poultry.

THE PRUNE MARKET...

By A. R. Sprague, President of California Fruit Exchange

A brief review of the history of prune marketing during the present season will clear the way for a consideration of its present strength or weakness. Early in the season the jobbers were smarting because of losses from the early purchase of prunes of the crop of 1902, which they were obliged to sell for less money than they had paid for them. They had received no protection from California or from the various firms from whom they had purchased. The utter demoralization which was the sad legacy left by the Cured Fruit Assocation, made values extremely uncertain. But early in the summer it became evident that the coast crop as well as the crop of prunes in Europe would not exceed fifty per cent of the usual product, and even with the carry-over from the crop of 1902 it was apparent there would be a heavy shortage in the world's supply. Therefore, by the law of supply and demand it was reasonable to expect a better price for prunes than had prevailed during previous seasons. At this time, however, a most injurious influence thrust itself upon the market. A leading speculative firm began to sell futures, promising to deliver in October the crop not yet grown, at prices which were unwarrantably low. This is a practice which is most damaging to the marketing of any article to which it is applied. It was this same practice, by the same speculative firm, that so reduced prices of raisins as to cause them to bring less than cost of production, previous to the organization of the California Raisin Growers' Association. Having sold freely at the low prices quoted, this firm sought to buy at a sufficiently low rate to enable them to fill their orders at a profit. In this attempt they were defeated by the general determination of Santa Clara prune growers in their co-operative organization not to sacrifice their prunes at such prices.

Thus, this, and other such firms, early found themselves practically sold out of prunes, and their interests then lay in pounding down prices so as to enable them to secure a large supply for the rising market which the situation promised. Thus their influence has been most detrimental to the market up to the present time.

No sooner did the executive committee of the growers authorize a 2¾ basis than these firms dropped at once to a 2½ basis, thus making very clear their purposes. Having extremely limited supply they were far more interested as buyers than as sellers.

The present supply of prunes is very largely in Santa Clara county, and in strong hands. The European consumption has been very active and has largely taken the hold-over prunes and those of very inferior quality. Outside of Santa Clara county, save in Oregon, there are no co-operative organizations of prune growers, and consequently these prunes were sold at prices made by the speculative firms, and have been used to supply the market up to the present time.

Owing to the utter disregard of the label law, most of these outside prunes were branded as "Santa Claras," and many of the old crop were mixed with the new and the mixture shipped as "new crop prunes." Thus up to the present time the prunes which have gone to the consumer have been largely of inferior quality. These are now pretty well exhausted, a very small supply remaining either on the coast or in eastern warehouses.

Owing to the fact that the prunes which must go into consumption are at least five-sixths of them now held in Santa Clara county, it might seem that the situation is unusually poor at this time, but quite the reverse of this is true. In previous years a large portion of this supply before this time had already gone into eastern warehouses, but not into consumption; therefore it is clear that we need be concerned only to know whether or not the supply is now greater than the expectation of a reasonable consumption during the months yet remaining of the present season.

This leads to the inquiry as to what is the present strength or weakness of the market. Under this head we may consider, first, that there is a very small world's supply of prunes, and these now of very fine quality. Second, the concentration of this supply is quite satisfactory. Three-fourths of it, at least, being under the control of growers' organizations or of growers who are willing to assist in any practical way in sustaining the market. The Willamette Valley Prune Growers' Association, at Salem, Oregon, which is the centralized organization for several local associations, state that they hold three-fourths of the prunes still remaining in Oregon, and they place the total supply at not to exceed three hundred cars. These are Italian prunes, and of course do not furnish very close competition for California prunes. This organization is most anxious to act in harmony with the California prune growers, and their assistance can be depended upon.

It is admitted that we have sold over sixty-five million pounds since the beginning of the present season to Europe alone, and an outside estimate by those most anxious to depress the market places the coast supply on January first at forty-five million pounds. This is probably from five to ten million pounds too high, but if it be conceded that on January first there remained forty-five million pounds of prunes, the situation even then is most encouraging, for it is admitted that the supply in all the consuming markets is extremely small and the best months for consumption of prunes are yet before us. So long as fresh apples are abundant and cheap in the east, people do not eat very freely of dried fruit, but these are already beginning to be scarce and high, and February, March, April and May are the months of heaviest consumption of California's dried fruit. Surely it is reasonable to expect that the present supply will all be called for before the new crop is ready for market.

The European demand is by no means supplied, and the best information shows a rising market with good demand from the heavy prune centers of Europe.

The weakness of the present situation consists of two things: first, the determination of speculative packers to break the market to constantly lower levels, and, second, the jobbers' distrust and their hesitation to push prunes upon the attention of consumers.

How can these weakening influences be met? In the first place the supply of cheap prunes must be cut off by a vigorous compaign of information, and the market must be strengthened by the harmonious and effective action in the eastern markets on the part of the growers' organizations. Every prune grower and every local packer must be made to realize that he had far better let the grubs destroy his trees than neglect to co-operate for the proper protection of the market for his prunes. We do not wish to have the cousumer pay more for his prunes than at present. We want to make it possible, rather, for him to buy them more cheaply. But if we sell at one-quarter cent more or less per pound, to the jobber the consumer never knows of it.

When the J. K. Armsby Company, through their coast manager, Mr. Freeman, asserts that only the general failure of the European prune crop has enabled California prune growers to market what prunes they have sold, it shows how desperate that firm considers the demoralization to be. They have no remedies to suggest except to cut the prices.

They have little at stake as compared with any prune grower whose living depends upon the prices received for his prunes.

It is a most unsatisfactory basis for a great interest to have its very existence depend upon the prices which speculators choose to fix upon their product or upon whether or not eastern jobbers choose to drum the trade for the sale of prunes. This must be changed. We must so advertise our product that eastern families will demand prunes from their grocers and these in turn will call for prunes from the wholesaler and jobber. We must place these within reach of the consumer at reasonable prices, conceding to the wholesaler and retailer only such profit as they are accustomed to get in handling other articles of common consumption. We must secure such official inspection of our product as will prevent worthless and unwholesome fruit from going forward to clog the markets for our good California fruit.

If there is to be hereafter any reasonable profit in growing California fruit, these things must be done, and it only remains to inquire how this can be accomplished.

The Poultry Yards of Petaluma. (See Page 184.)

Prof. Steubenrauch, of the University of California, visited Coachella recently and the Submarine thus comments on an important discovery he has made: "It was he who last year pollinated the only female date palm tree in the valley—alongside the land company's reservoir, Coachella—with the result that it bore the first edible dates ever produced in California, pronounced as fine as any grown in Persia or Algeria. And now he has concluded to establish a date palm experiment station somewhere in the Coachella valley. He has gone on to Washington to lay the matter before his superiors in the Department of Agriculture."

The Purissima oil well has develboped into a great gusher, with an estimated capacity of nearly 1000 barrels daily. If this continues it will be the second best well in California.

San Bernardino will be widely advertised at the St. Louis fair. 200,000 pamphlets will be prepared for distribution and proper persons will be sent to judiciously handle them.

ITEMS OF INTEREST.

In the passing of Senator Hanna, the country has lost a strong hand in the commercial field. Not so much will he be missed in politics as in the numerous business enterprises in which he was engaged. It speaks much for his character for fairness and justice, that in all his eventful business career, employing as he did hundreds of laborers, he never had a strike among his employes. And today, no class of mourners in the city where he resided, stand about his bier with sadder hearts than the men who have been his helpers in the varied enterprises which he controlled for the past quarter of a century.

* * *

The effect of the war between Japan and Russia is already beginning to be felt in the slight advance that has come in prices on beef cattle and hogs. The longer the contest lasts the greater will be the effect on our export commerce. That the war between the giant and the pigmy will be of short duration is not to be thought of, for although Japan is having it all her own way today, Russia will wake up by and by, and then look for such a conflict as the world has not witnessed since the Civil War in the United States.

* * *

The New Raisin Contract.—The California Raisin Growers' Association is now presenting the matter of new raisin contracts. The last contract was only for one year, and it was with great difficulty that a sufficient number could be induced to sign for the one year. But the management find the difficulties of marketing under so short a contract so great that another attempt will be made for a longer one. The directors say: "We herewith enclose duplicate copies to every raisin grower for signatures, the prompt signing of which would enable your directors to make arrangements for packing, seeding and marketing the 1904 crop, from an independent standpoint, without having to submit to any dictation not in conformity with the growers' interests. It is, further, the only foundation on which reforms and improvements of our association can be affected, and would make possible the successful marketing of the balance of the present crop and enable the directors to clear the present indebtedness, and make a further payment to the grower by infusing confidence as to the stability of the association in the minds of eastern dealers."

May the growers have judgment enough to stand by their directors, or else elect those who can be trusted. It may not be so serious that it's "hang together or hang separate," but many raisin growers will be bankrupt if the separating idea is carried out.

Sign up, Fresno, for three years.

* * *

Prosperous Year in View.—The rainfall which now approximates two inches in Southern California, and much more in the central and northern part of the State, practically insures profitable crops and feed for the season. Of course we shall have more rain this month, while March is expected to bring several inches. Judging from past experiences, March is likely to be a wet month all through. With three inches more this month and six inches in March, and two inches in April, we shall get probably 13 inches of rain, which will do very well. Crops will be matured and prosperity assured.

* * *

The Slogan of the Hour.—There never was a time in the history of the fruit growers of Southern California when the command uttered in an ancient emergency, "To thy tents, O Israel," was more potent in import than at this hour, when influences are at work to break down the co-operative conditions which have made for good in the life of the orchardists in this part of the State. The Cultivator feels like repeating this ancient command (as a suggestion) at this time. A struggle is going on to tear down the well defined lines established by the Co-operative Agency through which the orange growers have marketed their fruit in the past, and through which they intend to operate in the future. To do so will mean demoralization, and we fear, lasting injury to the individual and combined interests of all fruit growers. "In union there is strength," is an old and well settled doctrine which will apply as well to commercial as to civic or political affairs. In the evolution of business industries, going on today, the necessity for unity of action among interested fruit growers is more necessary than at any former period in the history of co-operative efforts in California. To break apart now may imperil the fruit growing industry in Southern California—especially when a fight of the import of the one now being waged against the co-operative interests in this State is at its height in the east. Verily, there is need for every man to his tent.

* * *

Conserve the Rainfall.—The San Francisco Call very clearly sets out the necessity for conserving the rainfall in Southern California to counteract the possibility of drouth in the coming years. The Cultivator has repeatedly argued this matter, and shown from competent authorities, the ability of the State to conserve its own rainfall and to add to its productive capacity.

"California," remarks the Call, "is not exactly subject to drouth, but many sections of the State are liable to it, so that whenever here is a long lack of rain a period of anxiety follows, and there is a sort of lagging in business and in enterprise by reason of the fear of short crops for the coming season.

"Science cannot as yet set in motion forces in the atmosphere that will precipitate rain, but science can guard against the waste of flood waters when they come and can make the best use of all that nature gives. The topography of California is such that is would be no very difficult feat to conserve the rainfall so that hardly a gallon of it would flow at any season unused to the sea; and it is full time public attention was earnestly directed to that end, not as a matter of academic discussion, but as one of practical statecraft of the first magnitude."

* * *

Introduction Garden Goes to Chico.—It has been publicly announced during the past week that the plant introduction garden, which the department of agriculture has decided to locate in California, will be located at Chico. This will be a disappointment to many other sections of the State, for it was sought by many. But Chico is a good location. It is in Butte county, in the Sacramento valley, and in one of the richest sections of that rich valley. The soil is a rich loam of unknown depth. The climate is almost perfect and the supply of water abundant.

The station, or garden, will be filled with trees and plants from all parts of the world and in the course of years will afford a vast amount of information. It is also asserted that tender and substantial plants will be cared for in other stations in Southern California.

* * *

There is no section in Southern California more easily to be rendered immune from the effects of drouth than the Lompoc valley, covering some twelve thousand acres. Besides the Santa Ynez river, always supplied with more or less water, there is, at a depth of seventy feet a strata of water-bearing gravel that can be tapped by wells from which water can be raised by the pump sufficient to make certain profitable annual production to justify the expenditure.

* * *

An item in these columns recently, stated that there had only been five inches of rainfall in the Antelope valley in the past five years. The writer intended, we suppose, to say, five inches a year, at the particular point from which the item was sent. Another correspondent writes from the valley that the rainfall has been from 20 to 70 inches, and not a single animal has died from drouth. Well, we are wondrously glad to correct the report, but there's an Ananias out somewhere.

* * *

M. Yabu, Japanese commissioner to the World's Fair at St. Louis, has just arrived in San Francisco from the Orient. With him is Mr. K. Yabe, Japan's most celebrated decorator of china, who has charge of the decorations at St. Louis. Yabu predicts a great Japanese victory which will end the war. He says that Japan is now fighting the battle of the civilized world, and expects no help from outside nations, only sympathy.

KIND WORDS FROM AN OLD FRIEND.

The Cultivator is in receipt of a welcome letter from W. B. Thomas, years ago one of the owners of the Cultivator, with Mr. Goodwin. Some of the older readers will remember the firm was formerly Goodwin & Thomas.

Mr. Thomas is now in Wahiawa, Hawaiian Islands, and is secretary of the Hawaiian Fruit and Plant Co., growers of pineapples.

Mr. Thomas says, in part:

I want to tell you how pleased I am at the success you have attained with the Cultivator. Having reached the ten thousand figure, it will grow rapidly from its own strength. Nothing succeeds like success.

Your change to a general agricultural paper for the entire coast was a good one. You could never have reached the circulation you have if you had not done so.

I put in a good many years hard work on the Cultivator myself, and I know the effort it cost to get the 4500 (I think that was the number) subscribers we had when I sold out.

BY J. W. JEFFREY, LOS ANGELES

CRAZY QUILT.

The writer has before him a full-page editorial from a fruit trade paper of New York upon the orange situation in the east. The paragraphs of this editorial remind one of the pieces in a crazy quilt which "our mothers used to make." You know the more grotesque of figure, unsystematic in shape or "loud" in color these crazy patches were, the more they enhanced the value of the quilt as a monstrosity of needle work. Here are a few of these distorted relicts of the waste bag of past experience in the orange trade.

"A commission man never has a grower in his clutches; indeed it is the other way. It is a fact that the relationship between the California growers and the eastern merchants are such that those who have stuck to the commission men have other reward for their years of labor than mortgaged farms." (Vide the red ink sales of 1892, when California oranges were but few and cold-storaging of apples had not been invented. Old birds cannot be caught with chaff. One of them showed me a wall all plastered with account sales in red ink from a commission merchant who never had any one in his clutches—Ed.)

"If Naftzger attempts to put the commission men out of business for the good of the growers were they expected to sit quietly by and let him accomplish it?" (As these same commission men are not investing a cent in California fruit this season they cannot be considered in business. They are not merchants, but merely agents to whom the growers who deal with them have turned over their goods without a thread of restraint excepting the hope of further commissions—a thread so weak that the legislature of New York has been driven again and again by the victims of commission dealing to attempt a reform by legal enactment.—Ed.)

In proof that the commission men are not merchants we refer to another piece from the quilt: "The independent receivers here (New York) are P. Ruhlman & Co., Sgobel & Day, and William Hills. Of these only the Ruhlman Company has a store; the other two firms have suites of offices in an office building. Ruhlman often puts an up-set auction price upon his fruit, and withdraws it from auction, only to sell it ex-store, 'job' it to better advantage. This happens every week." (But they are merchants in the sense of dealing in their own "goods" in thousands of cases to the detriment of fruits consigned to them by their customers. This allegation has been sworn to in court, published in economic works upon the sale of farm produce and seems to be a fact no longer doubted by anyone. A leading daily paper of Los Angeles charges that the commission men often make from 50 to 75 cents a box by "jobbing" it in their own houses, presumably after the fixing of an "up-set" price.—Ed)

Contrasted with the California grower we find this choice bit of piece work: "The Florida orange grower is a king. He owns his own packing house. He consigns, or sells f. o. b. or on the tree, as he pleases. The State swarms with buyers, and solicitors on consignments from east to west. Things do hum down there; money is lost, lots of it sometimes, but not by the grower. (Sic.) Consign or sell, he gets the cream of it. No mortgages for him, prosperous citizen." (A king within an ace of bankruptcy. A king of chumps if he depend upon other than himself to conduct his business at the most critical period, the selling period, without bonds, let or hindrance. On the 16th of this month one of these kings, bankrupt, stated to the editor that he had seen the time on many occasions when he would have made money to have let his fruit fall to the ground, rather than to have offered it on consignment, "prosperous citizen." This kind of "humming" was experienced in California less than a dozen years ago when the clutches were on.—Ed.)

The crazy quilter proceeds to advise the California grower. He "can be emancipated." "Let the fortunate ones here and there build their own packing houses," proceeds the oracle, "and gather in their neighbors, and let them together market their own crops, send their own agent east, to do their bidding, and entrust their oranges to merchants who know how to sell them." The last seven words are the kernel in the nut the organs are seeking to crack for the commission men. The Florida king reigns supreme in his individual packing house. California's coming kings must take another tack and reign in bunches, pool their sense to equal one Florida grower. Crazy advice.

There is not a firm in the Citrus Union or a director upon the Board of the California Fruit Exchange who could not buy every tangible asset of a half-dozen average commission men with the money he has invested in packing houses or orange groves. If the money actually invested in the orange business were the criterion the commission men would not last longer than a June frost in the light of an investigation. We close with this choice bit of patch-work from an interview with a commission man of New York, reported last week: "If the California growers' expenses cannot be reduced and the freight cannot be made cheaper, plainly his only recourse is to get bigger prices. His only chance to do this is to put his fruit into the hands of merchants who know how to sell it. The merchants have invested their money in the business (sic), and they are bound to realize good prices in order to make their business pay. They have only their commissions toward this end; no perquisites, no trimmings, no graft of any kind." Ananias lost his life upon a truthful statement compared with this.

CITRUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

BUDDING ORANGE TREES.

From two to four years ago, large numbers of bearing orange trees were budded over to Washington navels. There were many costly failures where success might just as well have followed, had the operator known of some of the important points that were being worked out by some of the thoughtful budders. Considerable budding had been done in the fall, in fact buds were put in some orchard trees as late as December. These resulted usually in an uneven stand. It was demonstrated that in order to secure a good stand of buds it was necessary to force them into growth as soon as they had knitted under the bark of the old trees. If left there very long after the healing over process has taken place, the bark grows over the buds so as to prevent their starting readily. The most successful method is to insert the buds when the heavy growth is well under way in the spring. Buds are inserted only in those branches which are required to make a symmetrical top. The tops of these branches are not pruned at all but side branches which are not used in budding are removed at the time and the wounds are waxed over. When the budding is done in locations where there is no danger of damaging frosts, the entire tops should be cut off when the buds have healed over perfectly. This occurs from one month to six weeks after the buds are inserted. When the spring is warm and early, the buds will have healed over enough to allow topping; if the weather continues cold and the growth of the trees is slow, six weeks is about the proper length of time. The waxed bands that are wrapped around the buds at the time they are inserted, are taken off at this time and the entire top sawed off about an inch above the buds, which are arranged in a circle around the branch. Wax heated so as to flow from a paint brush is put over the cuts and the entire trunk and what remains of the branches are whitewashed. This prevents sunburn and gives the orchard a neat appearance. Numerous suckers and watersprouts will come out all over the trees. These must be rubbed off after the buds have made a good start, and when the buds have made a growth of about 18 inches they should be pinched on the ends to make them branch. This also hardens the young growth so that it will stand the winter cold better. There will often be such a strong second growth that it also requires pinching back. If the young tops continue to grow till late in September, they should be topped to check growth so that they will not suffer severely from frost.

Where frosts are liable to kill back the young tops, by far the better way is to girdle the tops above the buds and keep the tops on the trees all summer and winter. They may serve as a roof and no wrapping is required to prevent injury from frost. When spring comes the tops should be removed. A good top may be secured this way when trees with the tops removed at the time of removing band from the buds will be ruined by frost. It is important to wrap young tops from the previous spring's buds when the old tops are removed at the time of budding. Palm leaves give the best results.

GUM DISEASE ON LEMON TREES.

In answer to a subscriber who wants a cure and a preventive for the gum disease on lemon trees, we will say that the best remedy so far discovered in the Pomona valley for the disease, is to scrape off the diseased tissue and then apply a paste made by slacking equal amounts of quick lime and sulphur in enough crude carbolic acid till it is of the consistency of thick whitewash.

The cause of this disease is supposed to be due to too much nitrogenous matter in conjunction with water coming in contact with the base of the tree. It has, however, appeared where these conditions have not existed. There has not been any very satisfactory explanation given for the appearance of this disease. It is evidently a sap disease that affects the whole tree, but only breaks out in spots as a rule.

CAUSES OF FRUIT DECAY.

The Riverside Press reports a very interesting session of orange growers of that county at which Mr. Powell, inspector, sent here by the Department of Agriculture, spoke at considerable length on the "causes of fruit decay." In his remarks Mr. Powell proceeded to say that the Department of Agriculture had conducted exhaustive investigations into the decay of deciduous fruit and the deductions were that the more mature the fruit the less susceptible was the fruit to decay. The more mature the apple the better is its keeping quality. In the apple investigations it was found that scald was found almost entirely on immature fruit, and this held true in the case of individual apples, the scald appearing on the immature or imperfect side. Ripening of fruit at high temperature makes trouble. In warehouses the keeping of fruit at high temperatures and with imperfect ventilation is responsible for a high percentage of the decay. Poor, wet soils need correcting. It has been found that high tillage makes better fruit and more of it, but this gain is offset by the poorest keeping quality of the fruit. For himself he would rather cultivate and sell early. The commercial methods in caring for the fruit was declared by the speaker to be prolific causes of decay. Packers and shippers do not realize that they are dealing with a living organism—something alive. Every cell of the apple contains the elements of life, and it dies of old age when it reaches the end of life. When fruit is taken from the tree it ripens very fast; it throws off water and breathes faster. The higher the temperature the faster the fruit will ripen. Lower the temperature and the ripening process is hindered. Rot and disease also develop more rapidly in high temperature, and add to these an excess of moisture and fungus germs will develop ninety per cent faster than where opposite conditions exist.

Anything that jars deciduous fruit injures its keeping qualities. Mr. Powell spoke on his observations of methods sometimes used in local orchards and packing houses, and declared against the promiscuous and careless handling of oranges and lemons, and attributed not a little the cause of the decay of the fruit in transit to this factor. All these operations cut down the resisting qualities of the fruit. A very tiny bruise may provide a habitat for the fungus to grow in. The fruit is just as sensitive to care as the human body. Poor ventilation and bad sanitary conditions are responsible for much of the decay in packing houses. Any system of packing that does not allow of a free passage of air is defective. Warmth and humidity are the conditions most favorable for the growth of trouble.

Mr. Powell illustrated his talk with colored plates of apples and pears taken under different conditions. In regard to the decay of peaches, Mr. Powell said it was not an uncommon thing last season for fully 75 per cent of the fruit to be decayed in transit from the South to New York. He attributed this in part to the high temperature of the fruit when it was placed in the cars. Could it have been cooled before putting it into the refrigerator cars much of the decay might have been obviated.

WILL FRUIT GROWING CONTINUE PROFITABLE TO CALIFORNIA?

General Chipman, in the San Francisco Call, answers this question in the affirmative. He calls attention to the fact that a business has been created in fruit growing which in the year 1902 brought in to the fruit growers of the State between $35,000,000 and $40,000,000, and the returns for 1903 were even greater. In addition to the large sums mentioned there were also large returns to the packers, canners, wine dealers, commission men and transportation companies.

Treating another phase, General Chipman writes:

"The essayist who treated the subject of the raisin at the Fresno convention, (a Fresno raisin grower) counseled no more planting of raisin grapes. Statistics show that in 1898 the raisin crop was as large as it was in 1902 and in ten years the output increased only 10,000 tons. Look at the citrus industry. In 1893 it was 80,757 tons and in 1902 it was 225,668 tons, and the orange grower was never more prosperous. There was an increased shipment of deciduous fruits in 1903 at prices reported satisfactory. Dried fruits moved out very promptly at remunerative prices and nuts at a high price. To the intending settler in California," writes General Chipman, "I unhesitatingly say come and join the noble army of fruit growers and be not afraid of over-production."

CITRUS NOTES.

The San Dimas Eagle reports orange packing going on at the local packing house with about one-half the regular force. The whole number shipped for the season to date has been 64 cars. "San Dimas lemons," says the Eagle, "have established a reputation for themselves. Manager Harwood says the market is good and the returns very satisfactory.

"The fruit is sold just as fast as it can be prepared for the market. None is being held in storage, the shipment being four cars a week. Since September 1st the house has shipped about 70 cars."

* * *

After two weeks rest the packing houses in all the orange districts commenced packing again last week. From now till the end of the season oranges will be rushed to the eastern markets.

* * *

Last Saturday a meeting of the San Dimas Lemon Association was held and the Covina Lemon Association was admitted to membership. The San Dimas lemons have enjoyed such an enviable reputation throughout the Middle West, and the management of the packing house been so well conducted that the growers have been highly pleased with the results, so that one by one the neighboring growers have closed their packing houses and joined the San Dimas association, thereby reducing expenses, concentrating the lemon industry, and insuring the best possible results. The packing house has a capacity of sixty-five carloads, and already handles the lemons from Glendora, La Verne, Pomona and Claremont, and now that Covina has been admitted, will leave San Dimas the only association packing house between Azusa and Upland.

* * *

There is now on exhibition at the Chamber of Commerce two varieties of limes that are attracting considerable attention owing to the great difference in their formation when compared with limes grown in Mexico and some of the southern States. The San Jacinto Land Company is growing a variety known as the Castleman lime. It is perhaps the most of a novelty in the way of a lime that has ever been on exhibition, being of a large elongated variety, practically seedless and full of juice. S. Carson, living on Adams street, presented the Chamber with what is known as the Improved Lime. It was budded on a lemon tree and is in appearance very much the shape of a lemon. It is, however, considered a very superior variety and the juice is very acid.—Riverside Enterprise.

ROEDING TRUE TREES FRESNO, CAL.

THE FIRST COST OF A TREE IS A MINOR MATTER

Trees and Vines

Of All Sorts For Sale

Our stock of all varieties is large, thrifty and very uniform. We exercise great care, not only in growing, but in handling our trees in the nursery, salesyard and packing house, which insures planters the best stock. True to name. Large illustrated General Nursery Catalogue mailed for 5c postage.

Fancher Creek Nurseries

Incorporated

(Paid Up Capital, $200,000.00.)

BOX 14 FRESNO, CALIFORNIA

Growers should plant

CALIMYRNA Fig Trees

Because it has been demonstrated that they are a commercial success. Because this is the only fig that is fit for commercial purposes. The truth about this great fig industry can be found in a book entitled "The Smyrna Fig at Home and Abroad," by Geo. C. Roeding. Eighty-seven pages, fully illustrated. Sent postpaid for 25c. Mr. Roeding has the only bearing Calimyrna fig orchard in the U. S. Sample box of dried figs (the product of this orchard) can be had upon receipt of 20c postage.

BE SURE SEAL SHOWN HERE IS ON YOUR TREES

CAL-IMYRNA R FRESNO

LAND AND WATER

BY A. J. MCCLATCHIE, PHOENIX, ARIZ.

EUCALYPTS FOR TIMBER.

It is only during recent years that the real value of the eucalypts in the Southwest has begun to be realized. I say "begun to be realized," because I feel that we only partially foresee the value of these trees are destined to be to our region. It will be many years yet before we will come to anything like a full realization of the benefits that will result from an extended culture of this group of hardwood trees.

The eucalypts have alerady done much for the Southwest. Without them California would be a very different State. What we owe to them it is impossible to fully estimate. Without them, much of the landscape now modified by their presence would be comparatively monotonous and unattractive. Winds would sweep over regions where their progress is now checked by avenues and groves of eucalypts. The present increased interest in the planting of these trees will no doubt result in their becoming to many other portions of the Southwest the boon they have been to California.

Heretofore, however, the eucalypts have been useful principally as shade trees and windbreaks, and for fuel. To some extent, also, they have been used for fence posts and for piles. Only to a limited extent have they been grown for or utilized for the higher purposes for which hardwood timber is suitable. Furnishing posts for fences, piles for wharves, and fuel for the fireside is an unimportant office, and one that the eucalypts may well continue to fill, but not until they are grown for timber and made into the multitude of articles for which the various species are so well adapted will they play the part in our civilization for which they are especially fitted.

* * *

Besides their use in furnishing posts and piles, mentioned above, they are especially suited for the furnishing of telephone, telegraph, and trolley poles, of railway cross-ties, and of timbers for bridges and culverts. The rapidly increasing demand for poles to carry the wires for telephones, telegraph and trolley lines, makes the planting of eucalypts for these purposes certain to prove profitable. A large portion of the timber coming to us by water from the northern coast might be produced in Southern California, with profit to the growers.

But the most important purpose for which eucalypts can be grown is the furnishing of material for building and for manufacturing purposes. There is no apparent reason why timber for the construction of our agricultural implements, our vehicles, our furniture, and the furnishing of our houses may not be grown in the vicinity of where it is needed. Instead of shipping in these articles, or the material therefor, they could be produced from home-grown material. This idea is gradually gaining a foothold in California, and those who act acordingly will undoubtedly profit thereby. With material available for the manufacture of implements, furniture, carriages, wagons and railway cars, many industries would spring up that at present are not thought of in the region. There is little danger of overproduction of material, or even a probability of ever keeping pace with the demand.

As to the grade of land upon which eucalypts can be grown with profit. the net returns from the product will be the guide. It is now quite well established that the annual net profit from trees grown for fuel is $25 to $30 per acre in fairly good valley soil. This is ten per cent interest on $250 to $300, a fairly good valuation for average land. Hence it is apparent that the culture of eucalypts in good soil is profitable, even for fuel. But, as material for the purposes mentioned above, the timber would bring much more per acre. The cubical contents of an electric pole, for example, is only about one-fourth that of a cord of wood; yet the market price of the former is fully as much as that of the latter. Furthermore, the cost of the preparation of the poles for market could hardly be as great as the cutting of the trees into fuel. The cubical contents of 1000 feet of lumber is less than two-thirds that of a cord of wood; yet the market value of the former is several times that of the latter, even when the difference in the cost of manufacture is taken into consideration. Hence it seems evident that good level land may be profitably devoted to the growth of eucalypts for timber, even though their growth may not be as fast as of those used for fuel. But besides the arable, irrigable land, there is in the Southwest much land that is hilly, or for which there is no water supply, that can be utilized for timber production. The covering of these untillable treeless portions of the country with trees would be a distinct benefit to the region, as well as a source of profit to the growers. Already beginnings have been made along this line. From many parts of California news comes to the writer of the contemplated planting of extensive tracts of land to these trees, the largest undertaking being the planting of 3000 acres in the vicinity of El Faro, by Dwight Whitney, of Los Angeles. The first returns from eucalypts grown for timber would be tardier than from most other crops, but it is doubtful if those from any other crop will prove surer. It is now established that the returns from trees grown for fuel are regular and certain. The returns from those grown for timber would undoubtedly prove equally certain, and as surely perennial. A discussion of the species suitable for culture will follow in a succeeding issue.

* * *

SALT RIVER VALLEY WATER SUPPLY.

The supply of irrigating water has been very low in the Salt River valley thus far this winter. As in other parts of the Southwest, the rainfall has been very light since the first of October. The recent showers have been very welcome, but it is feared that the lack of snow in the mountains will cause irrigating water to be scarce next spring, even if the rains should be fairly heavy in the meantime. Without water storage, the major portion of the water that falls in heavy rainstorms goes by us to the ocean. The best that can be done in such cases is to store as much in the soil as possible, but the capacity of the present canal system is not sufficient for the diversion and distribution of all that the valley can utilize during any period of high water.

MAYWOOD COLONY NURSERY

W. HERBERT SAMSON, PROP.

We have for sale all leading varieties of Deciduous Fruit Trees

OUR SPECIALTY:

Lob Ingir or Genuine Smyrna Fig of Commerce

A WORD ABOUT FIGS: We sell the genuine Fig of Commerce. Our cuttings came from bearing trees in the orchard of the Stanford estate, near Vina, and the fruit from these trees, after being examined by the best fig experts of the State, is pronounced the genuine Fig of Commerce, the Lob Ingir. Dr. Eisen says this and no other variety should be known as Smyrna, if the name Smyrna is to be used at all. We can refer prospective purchasers to the Supt. of the Stanford ranch, at Vina, for a verification of this statement. As to my own reliability, I can refer parties to any of the leading merchants of Corning, and to the Bank of Tehama County, and the Herbert Kraft Co. Bank, at Red Bluff, Cal. No one in the Unites States originated the Commercial Smyrna Fig. It is a variety which has been grown in Asia Minor for thousands of years. Parties may originate a fancy name and copyright it, but this does not make the fig they sell under a copyrighted name, any better. The fig we sell does not require a high sounding name to make it appear as the only commercial fig. All that we claim for our fig is that it is known as the Lob Ingir, the cuttings of which came originally from the famous orchards of Smyrna, Asia Minor, and is of the variety so largely imported into the United States in the dried state. We are not charging you for a private copyrighted name, but we sell you good 2 to 4 foot trees of the Genuine Smyrna Fig of Commerce at $150 per M. To fully demonstrate the methods used by some nurserymen in giving old varieties of fruit trees a new name and thereby make it appear that they have the only genuine article, we will say, how ridiculous it would be if we copyrighted a name like "Muro" and sold the old variety of Muir Peach under this name. Do not be misled by copyrighted names. We have the genuine Smyrna Fig of Commerce and if you want to confirm our statement, we do not hesitate to refer you to the above named parties. We can supply prospective planters a small sample of our dried figs for comparison with the so-called copyrighted figs. We also have for sale all varieties of Capri Fig trees, and all of our customers will be supplied at the proper time with a colony of Fig Wasps, free of cost. Address

W. Herbert Samson, Prop., Corning, Tehama Co., Cal.

Make Your Own Fence...

We will furnish the wire at 2c per pound, No. 14 guage. Weighs about 1¼ pounds single strand per 100 feet. Figure it yourself and get a good fence cheap. You make mesh or openings to suit requirements. This is galvanized wire that has been used for other purposes, or it would be worth two or three times our price. Remit for amount required and get quick shipments. No quantity under 100 pounds supplied.

DECIDUOUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

ORCHARD WORK FOR FEBRUARY AND MARCH.

February and March being the two months which bring us the most rain, the orchard work should be so planned as to save as much of the moisture as possible. The regular pruning and cleaning up should be out of the way so that the plow and cultivator may be kept busy with nothing to interfere.

Orange trees require but little trimming, but the plowing should not be delayed later than February as it is probable that any serious breaking up of the fibrous roots near the surface at the time of blooming or before the fruit is set, may have a tendency to make the fruit drop. This is the opinion of some prominent growers, but we do not know if it is true. It is also a well known fact that a serious injury to a tree will sometimes throw it into fruit, and girdling is often resorted to to induce fruiting on some of our deciduous fruit trees and vines. But it is very good policy to allow an orange tree to maintain as even a condition as possible. Deep plowing, we would not advocate any other kind in a dry climate, always tears up numerous roots in an orange grove, and this operation should be done long enough before blooming time, to allow the trees to form a new fibrous root growth that will not be disturbed. If a green crop is to be plowed under it should be well rotted by the time the trees need the food contained in it. The roots of orange trees and some deciduous trees increase in activity in February. The most active growth comes on in April and May. From the middle of March to the middle of April is when the bloom is out in full. Very succulent crops should be well incorporated with the soil if plenty of moisture is present, after being turned under thirty days.

The proper time to plow under green manuring crops is not definitely settled yet, as no systematic work has been done along this line, but as far as we know it is probable that if the stuff is thoroughly rotted by the time the spring growth commences, the best results will have been obtained.

After the first general cultivation or plowing is well rounded up, cultivation after each rain or irrigation is about all that is necessary to do with the soil during the rest of the season. Some growers who have no green crops to plow under claim that plowing is unnecessary where the soil allows deep cultivation. Some of our best growers advocate and practice this method, but they do not do the work with factory made cultivators. They model one that goes as deep as a plow when horse power enough is used and have the blacksmith build it along those lines. Shallow cultivation without plowing will soon ruin any orchard as has been shown in numerous cases.

* * *

FERTILIZERS.

We have been asked to give an article on fertilizers, best for orchards and how to apply. This we cannot do justice to as we have been unable to find any grower who can swear what is the best or say how much or often it should be applied. There is one thing that we are sure of and that is, stable manure generally gives good results, but the finest oranges do not come from trees that are fertilized with it entirely for years. Some soils may need it more than others, but for continual use it is pretty well decided that some thing else should go with it. It is also reasonably sure that quick acting nitrates should not be used before the spring growth is about to start. How much is needed by an orange tree, no man knows by actual experience. All of our growers whom we have consulted and who have been in the business the longest tell us that they are at sea on this point with all of the elements used in fertilization. We have been told authentically that 20 pounds of nitrate of soda had been given to an apple tree where indifferent cultivation was given and there was no perceptible difference between the fruit, foliage or growth upon that tree and trees near at hand under similar conditions except that they had received no nitrate. One pound of this element is considered a full dose for a bearing orange tree. These are the most definite things that we know about fertilizers. When the Agricultural Department of the State University finishes some work that it has recently undertaken, it will be in a position to throw more light on the subject than has ever been given before. This work will not be completed for five or six years, as nothing definite can be worked out in two or three seasons. In the Gilbert and Laws Experimental trials with annual crops, it was found that after fifty years of cropping, the same ground yielded about as large crops at the end of the experiment as they did at first. The difference was no doubt due to the difference in climatic conditions. We also have climatic conditions to contend with.

* * *

PRUNING APPLE TREES.

Editor Cultivator: Can you give any information as to how to prune apple trees? Should the new growth all be cut back on trees ten years old or less? Or, suppose the trees made a growth of from one and a half to three feet last season, how much of it should be cut off? I would like to know especially about the White Winter Pearmain tree.—H. R. Case, Santa Ana.

It is as desirable to keep an apple tree from growing skyward as it is to so control any tree, but the habit of the Pearmain is to grow squatty and spread out. It bears its fruit all through the tree and will therefore stand considerable cutting back without reducing the crop to any great extent. The pruning should be confined to cutting back to laterals when it is desired to keep the head low. If it is desirable to fill in an open place a branch may be cut off to a bud on the side next to where the opening is. Cutting to a horizontal branch will have a tendency to force fruiting spurs. Should there be no laterals on branches that are growing too long, cut them back to the first side branch on older wood or leave it till the following season, when it will very likely have sent out laterals.

No severe cutting should be done at one time on those varieties which produce their fruit on the ends of the branches. White Astrachan and Famous are examples. If the trees have been neglected so that there is an abundance of long brush, part of it may be headed in one season, and part the next.

Three feet growth in the top of a ten year old apple tree will soon get it up in the air, and if it is cut back half each year, it will make a decided improvement provided the top does not become too thick. This may be avoided by cutting to laterals and thinning out.

* * *

MORNNG GLORY KILLED WITH A CANNON.

Editor Cultivator:—Can you tell me through the columns of the Cultivator the formula that Marvin Cannon kills morning glory with and oblige, W. G., Healdsburg.

We cannot give the formula at this time. It is our opinion that any concoction that will kill morning glory will also kill the soil for some time to come. The essential virtue of morning glory is that it stands very rough treatment and more than almost any other plant that grows. If Mr. Cannon will give us his formula we will be very thankful to him and will give it a test.

LAWN BEETLE.

Mr. Maskew referred to the Fuller's rose beetle as the most serious insect pest of Southern California. We described and illustrated that specie recently; this week we describe the lawn or strawberry beetle. The fine drawings from which the engravings were made to illustrate this species were made by one of my students, Mr. Albert Barrows. Surely we may refer to this as the second most destructive beetle of our State. All who came from the East will remember the old May or June beetle of that section. This one may be called the May or June beetle of California. This one, however, is not confined to our State, but is found all over the country. It is closely related to the Eastern beetle, not only in structure, but in form, appearance and habits. In one important respect, however, it is quite different from its eastern congener. It can live on and does feed on both decaying and living matter. I think the one east feeds only on living plants.

* * *

Natural History.—We see by the figure that this is a beetle, and that the larva (Fig. 1) is a grub. It, like the one in the East, is often called, because of the color, the "white grub." The fine large brown beetle (Fig. 3) comes forth from the earth in May and June. At this time it eats foliage from the trees, and other plants, and always feeds at night. When we see fresh evidence of leaves being eaten and see no insect about them in the early summer, we may suspect this beetle to be the culprit. The female (Fig 3), usually larger than the male, is shown in the figure. The elbowed, lamellate antennae show that it belongs to the June beetle family. The female may lay her eggs either at the roots of perennial vegetation, like strawberries, or grass, or in the heaps of manure. These soon hatch, when the white, wrinkled grubs (Fig. 1), now very small, begin to feed and grow. The head of the grub is brown, and they have scattering hairs on their bodies. We usually find them somewhat curled up, as we take them from the earth. They live and feed in the earth for three years and so will often be found in the same place of two different sizes. The ones from Escondido commented on some time since, were quite different in size. When full grown they are over an inch long and pupate in an earthen cocoon or cavity which they form in the ground. The pupa (Fig. 2) is shown in the figure. They usually pupate in the early part of the third season, and very soon come forth again in the mature state. It will be some days before they finish mating and laying their eggs; and this is the time that they swarm in the various trees and feed upon the leaves. I have often known them to be so thick in the trees that one would think them to be, from the noise, a swarm of bees, except that bees do not swarm at eventide.

Fig. 1

Fig. 2

Fig. 3

* * *

Remedies—It is hard to suggest remedies where insects work under ground and are so numerous as are these June beetles. I have referred to the fact that they often commence their life in the stable fertilizer of the barn. It is unwise, then, to use such fertilizer, if upon examination, these grubs are found working upon it. Dressing a lawn or applying such fertilizer to strawberry beds often results in great injury. In case a lawn is badly attacked, which will show in the fact that the grass roots are all devoured so that the dry grass can be all raked off clean, it is well to spade up and replant the lawn at once. If these beetles are very common or destructive, which I have not observed to be generally true in California, then it may be wise to use white clover instead of blue grass for the lawn. Clover is not to the taste of these grubs and so is not molested. Clover also makes a very beautiful lawn. In the case of strawberries, if the beetles are working badly I think it wise to dig up and replant in another place, hoping that the beetles will not continue their evil work. Usually the one that entertains this hope will not be disappointed.

* * *

THE RED MITE.

Mr. R. B. Lane, of Redlands, has a lemon grove which is suffering with red mites. He thinks of using the sulphur spray as recommended by the University; but his foreman recommends the distillate spray. The foreman is at Hollywood, where the orchard is located, and reports that others have used the distillate and that "it does the work." He asks, "what is your experience and opinion?" I am glad to report that the success with the distillate about here of late, is very encouraging. At a large meeting of our Claremont Pomological Club, held last Monday, I gave the results of my visits in orchards of late, where the evidence was very conclusive. Orchards sprayed were clean of the mites, though the white exuvia and egg shells showed that the pest had been there in force before the spraying was done, indeed the spray was applied because of the mites. Other orchards close by, unsprayed, were suffering very seriously. The injury is threefold: the leaves drop, the fruit drops, and the fruit that does not drop is decidedly off in flavor. In some of the orchards the benefit of spraying six weeks before would amount to a big sum. Several present confirmed my statements. Mr. Le Roy, secretary of the club, sprayed his orchard, which was quite bad with black scale. He now finds it free of scale and there are no red mites, though his neighbors who did not spray, though some of them fumigated, were being seriously injured by this pest. Mr. Schureman, foreman of the Indian Hill Exchange, was conversant with the doings of the orchardists generally, and he was quite emphatic in commending the distillate for the mite as well as for the scale. There was no contrary opinion, though this is the center of extensive spraying a year ago. The president of the club stated these points and no one denied one of them. Proper distillate, properly applied, kills both the black scale and the mite, and the eggs of the latter so often that it seems to do effective work, though only one application is made. It does not spot the fruit, and is very much cheaper than is fumigation. It is very important that the work be done well, and usually it will pay the orchardist to be one of the party that does the work.

* * *

SPOTTING FRUIT.

There were many specimens of spotted fruit exhibited at the club meeting mentioned above. All agreed that was done by the thrip, or was done by the wind of the first week of December. It was explaned that both thrip and mites would be much more in evidence in such dry seasons, and that we might be sure that much more evil would be wrought in such dry years.

* * *

CALIFORNIA AS A BEE STATE.

The statistics taken at the late National Bee Convention, held at Los Angeles, were very pleasant to hear, especially for Californians. Of the sixteen that had produced over 50,000 pounds of honey, nine were Californians. Of the eight who had produced over 80,000 pounds, five were California apiarists. If we except W. H. Pain, of Hawaii, with his 300,000 pounds, though he had only 200 colonies, and which must have been a mistake, California takes the lead, with Mr. M. H. Mendelson, of Ventura, with 123,000 pounds. Mr. L. E. Mercer, of the same place, reported 100,000 pounds. If we could only be sure of rains, wouldn't California be the banner honey State? In regions of extensive alfalfa fields, where irrigation is carried on extensively, they get large honey crops, despite the drouths. Alfalfa honey is very fine, and the large profits in the San Joaquin valley are largely from this source. Without doubt the future of our State, with its large acreage of alfalfa, and its large planting of eucalypts, will offer special advantages to the apiarist.

ENCOURAGING SIGNS.

The wells about Claremont are reported to have risen of late more than fifteen feet. As we have had no rains at all, the source of this inflow must be a long way off, especially as the pumps have been kept steadily at work right along. A similar phenomenon was noticed a year ago.

* * *

FARMERS' INSTITUTE.

About six institutes will be held about the first week of April. Four are already located: Monrovia, Cucamonga, Elsinore and Hemet. Mrs. Minnie Sherman has promised to be with us and aid in these institutes.

APRICOT CRACKING.

John Thille, Santa Paula, Cal., asks: What is the cause of apricots cracking in the latter part of May and beginning of June; is there a known remedy and what is it?

It often happens that fruit will grow vigorously in the early part of the season, while there is abundant moisture in the soil, and will then stop as soon as the moisture becomes short. Now, if irrigation is resorted to, it will force another growth. This is sometimes more rapid than the fruit can accommodate itself to and the result is cracking of the fruit. In this case the only remedy is keeping up a uniform growth. Climatic conditions sometimes bring about the same results and these cannot be avoided. Still another cause of apricot cracking is shot hole fungus. When this disease is very bad, the fungus blotches will sometimes run into each other and, hardening, form a scab, a hardened surface on the fruit. This will crack open as the fruit grows and bring about the trouble. In this case the remedy is the Bordeaux mixture or the salt, sulphur and lime spray applied in winter before the buds open.—John Isaac.

We Have Them
WHAT?
Hand forged pocket knives and razors made in our own factory and guaranteed to be of superior quality. They are made of the best English steel, ground and tempered by hand by skilled workmen and will be found to have and to hold a good, keen cutting edge.
We will send you a fine, three blade knife for $1.00 or a two blade brass lined one for 75 cents. An extra fine concaved razor for $2.00 all prepaid.

CITRUS TREES
All the leading varieties. This stock is the cleanest and finest grown. Can fill any sized order and will guarantee satisfaction in price and quality. Write for further information.
W. G. HALL - GLENDORA, CAL.

Six Reasons Why

We merit your careful consideration if you are interested in the purchase of superior orange, lemon pomelo, lime, and citron of commerce trees:

1. Because we are specialists in this branch of horticulture; we make the growing of citrus trees an exclusive business.

2. Besides being specialists in growing citrus trees, we are also the largest producers in the world, hence are in a position to offer quality of stock as well as quantity.

3. We are not new to the business, having been established continuously in this one line since 1890, and enjoy the confidence of patrons all over the world.

4. Our name is a guarantee of quality. Our trees stand supreme wherever introduced; are true to name, well grown, and calculated to suit the demands of the most exacting.

5. We guarantee satisfaction in very instance, as we have the goods and propose to place them.

6. And finally, we can save you money on your purchases of citrus trees, for the reason that we have the quality which cannot be duplicated.

Let us send you a little booklet we have prepared, which illustrates California citrus orchards, and also has something to say on how to make money with citrus fruits. A copy is yours for the asking. Correspondence a pleasure.

Coast News and Notes

OF INTEREST TO FRUIT GROWERS, STOCKMEN AND AGRICULTURISTS

MISCELLANEOUS.

Corning is agitating the subject of incorporating.

San Francisco's racing track is to be enlarged at great expense.

All the Japanese soldiers in Riverside have been called home to engage in the war.

The recent rainfall in Oakland has been so large that it has interfered with street traffic.

A large ore body, said to assay $450 to the ton, is reported to have been encountered in the Robert Young mines near Manvel.

The promotors of the proposed electric road between Sacramento, Newcastle and Oroville, promise speedy construction of the line.

Anti-saloonists in the Carpenteria Valley have won a decided victory and there is only one place between Ventura and Santa Barbara where liquor is sold.

Justice Lewis of Cloverdale has made an order for the destruction of three nickel-in-the-slot machines which had been operated in violation of the State law.

During the rainfall at Sacramento last week 2.59 inches of water fell in twenty-four hours. This is the heaviest precipitation in that locality for any like period during the past twenty-six years.

According to the word of Superindent G. R. Joughins of the Santa Fe Coast lines, the company will not erect any new shops or make any addition to the old ones in San Bernardino before January 1, 1905.

The Ventura County Club House Association will issue a special edition of the Daily Free Press in the near future, the date to be set soon. The entire proceeds to the daily will be turned over to the Club House Association.

The Escondido Times says: "San Diego has a new railroad-squeezer-bloom-boom on these days and property is soaring skyward in a hurry. The ground floor is about six stories from the ground already, and still going up."

Continued rain in Mendocino and Lake counties has caused a sudden rise of all rivers and creeks. Wednesday night the streets of Willits were under water, several stores being flooded. It was impossible to travel about town without hip boots.

The Board of Managers of the State Hospital for Chronic Insane have decided to advertise for bids for the construction of a detached brick cottage for female patients. The estimated cost is $45,000. Bids will be opened February 26.

President Benjamin Ide Wheeler of the State University has suggested the plan of giving weekly concerts in the Greek amphitheater, to be participated in by the varous musical societies of the university, to display the advantages of the Greek theater.

John Wadleigh, of San Francisco, whose five children were taken from him by the Society for the Prevention of Cruelty to Children, has filed suit for $30,000 damages against the society. He aleges that the interference of the society in his family affairs was unwarranted.

Joseph Brown, a former prominent banker of San Bernardino, last week found in his pasture a package containing jewelry valued at between $250 and $300. Several watches were wrapped separately in a fragment of an Eastern newspaper. Probably some thief dropped them in his hurry.

The highest price per front foot ever pair for Seattle property was given up when the American Savings Bank and Trust Company of San Francisco, Butte and Seattle capitalists paid $2666.66 a front foot for a lot at the corner of Second avenue and Madison street.

An effort is being made to erect a home for homeless boys who drift into San Diego.

A damaging fire has been reported from Fallbrook, on Sunday, in which something like $10,000 was lost.

J. H. West, of Needles, is about to buy the Waterman ranch of 600 acres at the mouth of Waterman canyon, for $25,000. He will erect a sanitarium on his purchase.

Ramon the Giant, a stalwart brave from the Manuel Indian Reservation above Highland, made a sensational attempt to kidnap Victoria Pabolo, the squaw of another brave, who some years since cast aside the habits of his tribe for civilized ways. For years the Giant has been enamored of the squaw.

The State Supreme Court last week decided an appeal in the case in favor of the Ukiah Water and Improvement Company and against the city of Ukiah. In a fire at Ukiah some city property was destroyed. The city brought suit alleging that the pressure furnished by the company was insufficient. The Supreme Court held that there was not sufficient ground for action.

The case of Justice vs. F. M. Robinson, Tax Collector of Orange county, appealed four years ago to the Supreme Court, has been decided in favor of the defendant, affirming the decision of the lower court. The action was brought by Justice, a tax payer of the Bolsa drainage district, to recover district taxes paid and alleged by him in the complaint to be invalid because the act under which the district was organized was said to be unconstitutional and the organization irregular.

HORTICULTURE.

The season's output of apples from Lompoc packing houses aggregated sixty car loads.

Nearly 18,000 men have been laid off in the last three months by fifteen railroads centering in Chicago. Seven other lines have laid off a large number of employes.

A news item from Shasta county states that during the past season there were shipped from there nearly 100 tons of apples. The average price received by the growers was 2 cents per pound.

Wm. M. Lauton, editor of the Paradise of the Pacific, of Honolulu, who is conducting some examinations in Southern California on fruit matters, is very enthusiastic over the future of the Hawaiian islands as a fruit growing country.

Orange growers of Ventura County are tired of having their orchards raided by wealthy eastern tourists, who stop their automobiles and help themselves liberally to the fruit. The growers held a meeting and resolved to cause the arrest of every one caught in their groves, irrespective of their apparent standing in society.

A. P. Griffith is shipping citrus fruits in extreme sizes. Pomelos in 48s and Kumquats in 3-4 lb. berry boxes. Mr. Griffith has orders for all he can furnish. For the benefit of those who do not know what kumquats are it might be well to explain that they are small Japanese oranges, oval in shape and run in size from an olive to a bantam's egg. They are preserved. They come high but people will have them.—Azusa Pomotropic.

AGRICULTURE.

Grain raisers in the eastern part of San Luis Obispo county are preparing to irrigate on a larger scale. Artesian wells are being sunk at Creston, Shandon and other points on the Huer-Huero river where the supply of water seems unending.

The Sacramento Union says the hop growers in Sacramento and Yolo counties are busy fixing up their yards and getting ready for the good season promised. Contracts are being made for the coming crop on the basis of from 15 to 17½ cents a pound. Many growers are expecting higher prices.

Coast News and Notes

CONTINUED

LIVE STOCK.

The Pacific creamery at Fullerton has made arrangement to build a portable pumping plant to pump water for the farmers at a low rate or practically at cost.

A Kern county correspondent writes that rain enough has fallen in that county to insure good pasture and relieve the stockmen from future anxiety on that point.

The annual dairy report for Washington shows that 126 new creameries were established during 1903, and that the butter production amounted to 6,970,992 pounds, an increase of 17 per cent over 1902. The increase was general over the State.

A dispatch from San Luis Obispo says the rain of the last few days insures sufficient pasture on the stock ranges of that county. The grass is springing up rapidly. Stock men announce that there will be no necessity for removing cattle out of that county.

HORTICULTURE.

The Lindsay Arbor Club is an association formed for the purpose of encouraging tree planting in Lindsay.

The new lemon house of the Lemon Growers' Exchange of Upland has been completed. The house has a floor space of 11,250 square feet and a basement 50x75 feet, 8 feet high.

The Redlands Citrograph says that through the use of sprayers the yellow scale has been completely wiped out of old San Bernardino. About 300 acres of orange trees have been sprayed.

The latest piece of grafting we note is that which is being worked by a set of promoters in the northern part of this State. The fruit grower is told that for the small sum of 50 cents he can get his trees bored with an auger and a compound poured in that will inoculate his trees against all forms of pests. The theory being that the sap, or circulation, will carry the odor of the dissolved ingredient to every part of the tree and drive away all forms of pests. This is simply a fake proposition and the orchardist who consents to imperil his trees in any such manner is foolish in the extreme.

AGRICULTURE.

Early grain continues in excellent condition, says the Sonoma Reporter, but its growth is slow, owing to cold weather. The acreage is reported considerably larger than last season and prospects are bright for excellent crops.

Beet planting has commenced on Chino lands. The disposition is to grow a larger acreage this year than last. The Champion says: "Applications are now covering 6000 acres and from 1000 to 2000 acres more are in sight.

L. Hache, agricultural superintendent of the American Beet Sugar Company in Chino, says that beets are being planted at Oxnard now. From 3000 to 4000 acres of land there are under irrigation systems, and can grow a crop regardless of rain.

A dispatch from North Yakima, Wash., states that Joe McNeff, representing Uhlman Bros., of New York, made a hop contract with S. Huntington for 60,000 pounds of the 1904 crop at 20 cents a pound. This is the largest figure contracts have yet been made for, and is believed to be the largest figure ever paid on futures for a number of years past in the State.

The California Raisin Growers' Association has sent to growers a three years' contract for signature, which, if promptly signed by a major portion of growers, will allow the directors of the association to make arrangements for the packing, seeding and marketing of the 1904 crop independently of any interest not in conformity with their own. The association further states that if enough signatures can be obtained the marketing of the balance of the 1903 crop will be greatly facilitated.

MISCELLANEOUS.

Long Beach is to have a new pier costing about $80,000.

The Pasadena Masons are going to build a $50,000 temple at once.

The wild duck season closed on Monday the 15th. All wild birds belong to this class.

Geo. W. Lord and Dick Richardson have discovered a fine deposit of clay near Corona.

Monrovia has just let the contract for a new, modern school house to cost $23,257 and to be completed in 160 working days.

The trustees of the city of Alhambra have donated $50 to the Leagues of Manufacturers to assist in fighting the claims of the oil roads trust.

The Pacific Homestead, of Salem, Oregon, comes to our table much improved in typographical appearance and editorial and special matter.

On Wednesday morning of this week engineers began running a survey for an electric line of road between San Diego and El Cajon valley.

Munger & Sons of Yuba City have the only olive oil plant in the county and this winter they have turned out several hundred gallons for the market.

The Waterman ranch of 600 acres, located near the Arrowhead Hot Springs, has been sold at a price reported to be $25,000. This land carries valuable water rights besides the famous springs.

The Salt Lake railroad, on Saturday night and Sunday morning, stole a march on the citizens of Riverside, and despite injunctions laid a track from Tenth to Seventh street and within one block of its new depot, from which it has been divorced by the injunction issued by the court.

Ventura county will not collect the usual poll tax this year. The Democrat in commenting upon the action of the supervisors, says the collection of the tax this year was not necessary and that more harm than good would have resulted had the poll tax law been enforced.

The Coachella Submarine gives this item: H. W. Cottle has inaugurated a movement for the sinking of an artesian well, to be paid for by subscription, as a co-operative experiment; the well to be bored in whatever part of the valley may be decided upon by a conference of the subscribers.

McKeown, the defaulting secretary of the Berkeley University, was given a sentence of six years and eleven months for stealing upwards of $60,000. With the usual "good behavior" allowance, this means that he will go free in about five years. Prorated with his stealings, it is about $12,000 a year. —Alameda Encinal.

Plans are on foot at San Bernardino for a wide boulevard between San Bernardino and Colton, to follow the San Bernardino Valley Traction Company's route. The thoroughfare is to be eighty-five feet in width, not including the sidewalks, and will extend more than a mile through one of the largest orange groves in that section.

The new directory of the State University at Berkeley has just been completed and put on sale. The total number of students for this semester is 1216, a decrease of 145 from the number enrolled for the last. The number of under graduates shows a decrease of 120 as compared with last semester. Of the 1216 students now enrolled 88 are in graduate standing, 1020 are under graduates and 108 are special students.

HINTS FROM MODERN DAIRYING.

The value of skimmed milk cannot be too often impressed upon the brains of cow keepers and calf and pig raisers, says Hon. F. D. Coburn. It costs more to feed a heifer calf well from the day it is born to the day it begins to give milk, but it is the cheapest. A good cow is a good cow, no matter to what breed she belongs, and a poor cow is a poor cow in spite of long printed pedigree. Continuous good feeding and care, coupled with persistent good milking, will improve your cows from generation to generation. There is a difference between milkers that is alarming. Some can and do do good milking; some can, but don't and won't; others cannot to save their lives. Our wives should be listened to with great attention as regards dirty pails, hands, cans and so forth.

Excessive feeding of grain is foolish. A good pasture of mixed grasses is good feed enough for any cow, and to leave out grain for a while tends to her health and future usefulness. Most dogs hurry cows and far too many men and boys do, too; and men and boys do worse when they throw stones and clubs at the cows. Milk only is pure that no particle of filth from the stable has ever contaminated. Filth can be excluded from milk in no way but by keeping the cows from being soiled, and cows can be kept from being soiled only by having their stalls so arranged that they cannot lay down upon their droppings. The best calves from the best cows, which were the calves of the best cows, which were the descendants of the best sons and daughters of generations, are the calves to raise. There lurks in my mind the pictures of old Dobbin, old Homely, Fillpail and Tame, some of my father's best cows, which had been bred for generations on the principle of the "survival of the fittest." Their immense udders could and did carry to the barn in June, from their mountain pasture, over half a bushel of milk.

A TALK ON WASHING MILK CANS.

This is a homely subject, and at first glance some will say, "anybody can wash a milk can and get it clean, too."

The housekeeper washes the dinner dishes and puts them in the cupboard shining and clean, ready for the next meal. But should a surgeon require a knife or spoon to aid him in some surgical operation that spoon or knife must be treated with some antiseptic to clean it for the operation. These illustrations simply show the relative meaning of the word clean, and those things clean for one purpose are not clean for other purposes.

Our knowledge of what constitutes cleanliness in all these lines also gives to the word different shades of meaning. For instance, what is clean to one person may not be clean to another, even though it is to be used for the same purpose.

This leads us to the subject of dirty milk cans and how to clean them.

Taking the subject in general, we will say that in most cases sour milk rejected at the creamery is the result of the cans not being properly washed. To know when a can is clean, we must first know what constitutes dirt in this relation.

We have told people that their cans were dirty, and have right there raised a young cyclone. They evidently thought that we meant that dirt was sticking on to the cans in chunks big enough to see. (We have seen some cans in that condition.) A dirty can may, to all appearances, be clean, and here is where nearly all the trouble lies. The study of bacteriology reveals a few things to us along this line. From it we learn that the root at the bottom of our trouble, and out of which it grows, is a minute plant called bacteria—so small that it can only be seen by a powerful magnifying glass. These minute plants are found everywhere, in air, water, soil, and, in fact, everything. All decay is caused by them.

Out of myriads of different species a few thrive in milk and grow and multiply by living on the solids found in milk. As these minute plant growths absorb nourishment from different elements of the milk, these elements are themselves changed in form, and we soon begin to notice in the changed condition of the milk—it becomes sour, may have offensive odors, and it may become thick without souring, etc., and is soon unfit for use. When milk is first drawn from the cow, it is entirely free from germs, as bacteria are sometimes called, but the milk no sooner comes in contact with the air than it begins to have these germs introduced into it. It will be seen from this that were it possible to keep all germs away from the milk, we would have no trouble. If the germs are in the milk can when we pour in the milk, they at once begin to grow, and sour milk spoils. It is evident then that a can containing any of these germs is a dirty can.

Bacteria, or germs, grow best under certain conditions, just as do wheat and barley and oats.

Seed for a farm crop must have warmth, moisture nad food on which it can live and thrive. Deprive it of any of these and the result is disastrous to growth, as we can all of us testify as to the lack if moisture in past seasons. These three things have certain proportions or degrees at which the growth thrives best. Just so it is with bacteria.

Milk makes an excellent food for this minute plant because it supplies food in most available form and a proper kind for best and most rapid development of the species we are concerned with in dairying.

The temperature at which bacteria grow best ranges from 60 to 110 degrees.

Now, suppose we wash a can in luke-warm water, and turn it up to drain. We have supplied just the right conditions of temperature and moisture for the germs to grow and in all probability the water left on the sides of the cans will be milky, thus supplying an abundance of food. The can is seeded thoroughly, so to speak, with germs which will begin at once on fresh milk when put into it. Bacteria, like many of the larger plants we see about us, can stand great degrees of cold, but cannot

survive great heat. So here is the key to their destruction. You must destroy them by heat. For this boiling water is the farmer's best weapon, unless he be supplied with a steam boiler and can turn live hot steam into the cans. The water must be absolutely boiling hot, nothing less will de the work perfectly.

WILL THIS PROPHECY BE REALIZED.

The Farmer's Review, Chicago, says that "the time will come when the best butter will be made in the dairies, just as the best butter is now made in the factories. It is true today that here and there are private dairies in America that are making butter that is fine in quality and that brings in private trade a much higher price than any other kind of butter on the market. Today in all of our general markets factory butter is the most in demand and brings a higher price than farm butter. The reason is that dairy education has been more generally applied to the factories than it has to the dairies, because the latter are so numerous. How long it will be before the light of modern methods has reached the last dairy we cannot say. Then the conditions will have been reversed, as to the demand for butter. Dairy butters will then top the market and they will be of high quality. Naturally the farm dairy has the advantage over the factory. If all the appliances are right, if there are means at hand for the production of pure milk and means for the manufacture of butter, the farmer can make a better product than the factory. He has all things under complete control. He can ripen the cream as he desires and his work cannot be neutralized by the neglect of other men on other farms."

This may be the experience in the United States, but if all the milk growers be educated up to the standard of supplying either perfect milk or perfect cream to the factories, the cost of the manufacture of butter will always be much cheaper at the factory than on the farm.

FOR A BUTTER FAT TEST.

Editor California Cultivator: Referring to an article in your valuable publication January 20, 1904, for a test of breeds, I think that the Jersey Breeders' Association to a man would be agreeable to such a test as herein intimated. To be of greatest value to breeders and dairymen the test should be for one year; charge each cow up with what she consumes, giving credit for milk given according to butter fat contents, at market values; the gratest net result wins. Let the owners of each breed prescribe quantity of feeds to be fed, or feed each cow according to their respective requirements, having in view at all times the profits over feed consumed. The reason I say let the owner of each breed prescribe the amount of feed to be used is that it is known that the digestive capacity varies greatly in cows. I believe in giving each cow all she will take, digest and respond to. A cow weighing 1200 pounds requires more feed than an 800 pound cow. The 1200 pound cow has just 400 pounds more cow to furnish nourishment to sustain, and if not fed more than the 800 pound cow she cannot do her best. So let each cow be fed according to her respective requirements, for best results, the cow producing greatest net returns in butter fat the winner. This is the kind of a test that dairymen are interested in—not a butter fat test for one milking, day or a week's test—we have to feed the cow the year round, so we are looking for yearly profits. While the Jerseys are beautiful to look at, looks are not what dairymen are looking after, yet if we have beauty and quality combined, as I think we have in the Jersey cow—a cow that will give the greatest net returns for feed consumed. The one trouble is, we cannot get breeders of the milk breeds to meet us in a test, at least I have heard of no one willing to engage with the Jerseys in such a test, for Jersey breeders have been agitating a test of this kind for years. C. S. B., Riverside.

* * *

WILL FURNISH A HOLSTEIN.

Editor Cultivator: In an article published in your excellent paper of January 1st, Mr. White suggests a butter fat test between three or four breeds of the best type of butter cows. I have the honor to own a Holstein which, under favorable conditions of test, I would be pleased to enter in this contest. When I say "favorable conditions," I mean as to time, feed, care, etc. I think the test should be for three months, the feed consumed reckoned against the cow, and the milk after separating taken into account. I am sure such a test would be of interest and valuable in results. —V. C. M., Monrovia.

FEEDING THE HORSE.

We often have to deal with horses that are greedy feeders, those which push their food into their stomach when but half masticated, and in consequence, a large portion of the nutriment is wasted and besides it takes more grain to feed them and they are more predisposed to colic, worms, scours, etc. With many horses, this is due oftentimes to a bad condition of the teeth or the age of the horse. The teeth should be looked after. We have also found that by putting a few stones about the size of a hen's egg in with the feed the horse will be compelled to take food slowly and more carefully. Especially have we found this to be of benefit where the horse is inclined to bolt his food, thus while nosing among the stones for more, he will be grinding that which is already in his mouth and will begin to improve immediately.

Delicate feeders require care and patience in preparing a tempting diet. Some will eat if given a little at a time, but will not touch it if a large quantity is placed before them. Others will not eat unless their food is accompanied with water and some refuse to eat through nervousness or timidity. Boiling linseed oil to a jelly and mixing with oats will sometimes tempt a delicate feeder or hay slightly dampened, also wet bran with the oats makes a meal that they will relish. Where sick horses are being fed mashes, these mashes should be given in moderate quantities and carefully prepared. If poured into the manger, be careful and remove all leavings, otherwise it will sour and effect other feed put in subsequently. We have fed bran mash with success made as follows:

Put two quarts of bran into a pail or tight box and pour boiling water over it. Mix thoroughly and feed when cool. To make linseed mash, boil 1-2 pound of unground flaxseed in two quarts of water until reduced to about three pints. Put in bran or shorts and mix.—Country Club.

STOCKMEN FIGHTING REPEAL OF ACT.

Dispatches from Wyoming state that the cattle and sheep men have combined in opposition to the proposed repeal of the Timber and Stone Act, the Desert Land Act and the commutation clause of the Homestead Act. One dispatch states a summary of the views of the convention: "Absolute opposition to the repeal of the land laws, strong feeling that the scope of the laws should be enlarged and desire that the Government cede all lands but agricultural (irrigable) lands to the State in order that the range may be leased to stockmen."

Here crops out the original Wyoming effort to secure State cession, a policy of turning over the government lands to the State legislatures so that the State legislatures can turn them over to the stockmen. The history of the various State grants from the government, such as Nevada's two million acre grant, California's great swamp land grant, and many others, is surrounded with too much unfairness to the public in general to admit of Congress for a moment considering such a course as is suggested by the Wyoming stock interests.

FEEDING FOR EGGS.

In our last we had a talk on feeding the hens, which we selected for breeders, and I advised keeping the breeders, which should be the best layers and most vigorous birds in the flock, separate from the general flock in order that, next season, the pullets should come only from the most vigorous and prolific layers. Now we will attend to the rest of the flock, remembering that now we want to make the most money possible out of them or, as the saying is, we must push them for all they are worth.

The first thing to be done is to remove all the male birds from the flock (excepting those in the enclosed breeding pens) and dispose of them. The reason for this is the hens will lay as well without the males and the extra cost of their food will be avoided. The eggs also not being fertilized, are much superior for market purposes and keep fresh longer than the fertilized. When eggs are fertile there is the little germ of life in them, the tiny seed, which, nourished by the other contents, develops into the chick, but if the eggs are kept too long, or are in any way injured by heat or cold, or cracked, or a pinhole in them, the little germ dies, then there is death in the egg shell and corruption, and the egg is called stale or rotten. On all the large egg farms for commercial eggs no males are kept except those in the breeding pens.

In the forcing for eggs the pullets should be hatched in February, March or April, kept perfectly clean and free from lice during the summer, put into their winter quarters in September, so they may get used to them. Always remember that a change of any kind will cause a cessation of laying for a time. A change of feed or in the order of feeding will do this, a change in the position of the nests. Scaring the birds in any way by dogs or other animals coming near them will affect the egg production. A strange male bird being put into a pen will reduce the number of eggs. Any change and every change should be avoided.

The forcing for eggs means putting into the egg machine the materials to make the eggs and as much of the material as the hens can possibly contain without detriment to their health. To accomplish this the young hens or pullets must be made to exercise vigorously, and for this reason advise feeding grain in the scratching pens and making them work for it, and green food at noon, three times a week substituting green cut bone, if it can be procured fresh, about an ounce for each hen. And for the last meal at about four o'clock all the mash they will eat up clean.

The mash, being the meal that is to balance the food of the day, so as to make the balanced ration of 1:4, that is one part of protein to four of carbohydrates (this is the nutritive ratio of the yolk of an egg) should be fed liberally so that the hens may go to bed with their crops full. To the mash may be added three times a week a teaspoonful of red pepper for every twelve fowls, or one of the many condiments or egg foods advertised.

The mash may be made with one of the many "balanced rations" now sold at the poultry supply houses, always remembering that to change the ration at any time during the laying period will affect the egg production.

The mash I have used with success for years when I did not use the prepared foods has been two parts bran, one part each of rolled oats, corn meal, one-tenth part each of dried blood, ground bone, cotton seed meal, ground charcoal, occasionally malt sprouts, a little salt, with about five parts of finely cut clover or alfalfa—green or steamed, the whole mixed in a crumbly mash, either with the alfalfa tea, or water, or preferably with skimmed milk, to a crumbly consistency. To this could be added three times a week the red pepper or one of the many stimulants I mentioned.

* * *

For two years when my daughter and I were without help we fed the dry mash and reversed the order of feeding. The dry mash I used was two parts bran, one part rolled oats, one part feed meal or corn meal, a quarter of a part of ground bone or dried blood, a little charcoal and salt. This we mixed dry, without a drop of moisture, fed in troughs, dry, in the morning. The hens at first did not like it but after they became accustomed to it they laid just as well as with the wet mash, and we liked it better because it was much less work to feed four or five hundred fowls with the light dry stuff instead of mixing water with it and carrying round heavy buckets. The fowls drank a great deal of water with the dry mixture, they also had to eat it very slowly as they could not swallow it fast. We fed the dry mash (about a spoonful for each hen) in the morning, weighing and measuring it at first and giving the hens all they would eat in the long day. At noon we fed greens, and at four the grain, wheat, oats, corn, barley in the scratching pen. This gave us clean feeding in the afternoon and was much easier for us, and the hens did admirably. By feeding the damp, crumbly mash in the evening (four o'clock) the hens can be coaxed to eat more, also one can put into the ration more stimulating food than in the dry mash and as it all adheres together the hens have to swallow it. Some hens are quite fastidious and most hens at first dislike the new balanced rations. As a rule hens do not like linseed meal or oil cake, some do not like buckwheat in any form, but by persevering with them they finally acquire the taste and then all goes well. They all like clean table scraps and bread, and everything of that kind they should have.

MY EXPERIENCE WITH BUFF COCHINS.

Of all the Cochins, the buff variety is not only the most popular, but most plentiful, and long ago were called Shanghais, originating in Asia. A few were brought to England, where they created great admiration, which developed into a perfect craze. There has probably never been a variety which caught the fanciers by storm as

White Leghorns, Black Minorcas, White Wyandottes and Barred Plymouth Rocks

Trophy Winners at Late Los Angeles Show

In each variety my fowls won a share of the regular premiums, and in some thirteen out of a possible twenty-five, or more than all competitors combined. My winning of First, Second, Third, Fourth and Fifth Premiums on White Leghorn Cockerels was the most striking success of the Show. The winning of the National White Wyandotte Club's Blue Ribbon for the best display of White Wyandottes was equally significant. But over and above all, the winning of the Times Eagle Trophy, the most coveted of all the prizes, awarded for the best display—numbers and quality considered—was the most signal and the most important victory of the entire Show. The handsome Cup offered by The Live Stock Tribune was awarded to my stock on the same grounds. These victories only add to an already long list. My fowls have received first premiums wherever exhibited. Over eighty premiums in the last five years.

My fowls are not only standard-bred, but utility-bred. Hundreds of customers attest their merit They have proved their superiority both in the Show Room and as Breeders. There are no better fowls to be found anywhere, East or West. Both Stock and Eggs sold under absolute guarantees

508 SACRAMENTO ST., SAN FRANCISCO, CAL.

ey did. Fabulous prices were asked d paid. Then the fakirs got in their ork, claiming qualities for them that breed can ever attain. As a matter course, because they did not and uld not come up to such a standard, ey were soon condemned, and lost vor abroad as well as in this coun- y. They are lumpy in appearance, e female having scarcely any back all apparently, the cushion being so ll, in which the tail is buried. They e short-necked, broad-breasted, legs ort and set far apart, head small, ith comb short and neat. They have tle desire to roam, and will do as ell yarded as when given range. Tak- g on fat readily they must be fed proper sized ration, if egg production anticipated. While not ranking as 0-egg per year layers, they lay the tire year, by taking short rests after elding about 25 eggs. Subsequent to rest of about ten days they will lay ain, then take another rest, and this ey keep up through the moulting sea- n and the fall and winter months. hile they are broody, they will set ywhere, if given anything in the ape of an egg—but are clumsy and t to break the eggs, unless the nest built low and roomy. Having im- ense feathering around the hocks, ighs, fluff, etc., she can hover 25 icks as easily as a Wyandotte could , and they have no equal for affec- n, docility and a liking to be han- d and petted. My liking for them gan when I discovered that they re almost immune to roup, diarrhoea d lice. Their heavily feathered feet, sorb the lice killer put on the roosts d a louse is not going to crawl ough a feathered paw reeking with smell of petroleum. Every attempt scratch themselves but spreads the r to other sections of the fowl. In eeding I look first to the combs, then the shape and size, and the color be brought about afterward. They tch well, grow rapidly and the cock- ls or older males can be raised in same yard, as they are easily recon- ed to one another.

* * *

The craze for buff colored fowls has ought them into demand again, and those whose yard space is limited ey find much favor, being happy in nfinement, and unable to go over a o-foot fence, and the chicks can be arded by wire netting a foot high, ice the wings are too small to carry eir heavy bodies upward. I find it mparatively easy to produce evenly lored females, with clear neck and ngs, but the males cannot yet be oduced whose saddles are not a tri- darker in buff color than the breast, d whose tails do not show at least few splashes of bronze or black in me of the main feathers. The pul- s begin to lay at 7 months, but the ns should be marketed after their cond season. They are so domesti- ted that I found my San Francisco d Los Angeles prize winning fowls ing uninterruptedly during and right ng after the shows.—Harry McIn- e.

THRIFTY PETALUMA.

If any one thinks the poultry bus- ess of Petaluma is on the wane, a sit there will convince that quite e reverse is true.

Petaluma does not depend entirely on poultry products, at the same me it's a great factor. Every day e sloops go down Petaluma river at th tide to the bay and on to San ancisco market with tons of pro- ce. This shows that some products s out from the little city.

When the writer was there a few weeks since, a mammoth dredger was at work deepening the channel to facilitate the shipping.

In a short interview with Mr. L. C. Byce, of the Petaluma Incubator Co., a number of facts were gleaned which are of such interest that we are glad to give them.

Few people outside of actual residents of Petaluma know the inside history of the rise of the poultry business of that city, now the greatest poultry section of the world. A quarter of a century ago when the people of Petaluma vicinity were absorbed in dairying and potato raising, L. C. Byce, a medical student of Toronto, Canada, whose father was largely engaged in poultry raising, came to California to spend a year or two for his health, and immediately began to develop plans for artificial incubation, to

ROUP and CHOLERA
Why do so many so called poultry medicines fail? Because they are made to sell at 100 per cent and not to cure. Palmer Poultry Powder sells on its merits. Roup or cholera is no barrier to the poultry raiser now. Before this famous remedy was tested and its value proven the hatchet was used for roup. Now Palmer's Roup Remedies are used and the fowls saved.
PALMER'S POULTRY POWDERS
Trade Mark
You may think your fowls are healthy but do not lay. You buy egg producing food to force egg production. When your fowls are healthy nature fills the egg basket. Don't be deceived by cheap nostrums.
Palmer's Cholera Compound makes and keeps your hens healthy and vigorous and doubles the egg product. To try it is to buy it, to buy it is to make money.
PALMER POULTRY POWDER CO.,

Winner Buffalo World's Fair, Los Angeles, Oakland, Fresno

We won nearly every 1st, 2nd and Special on White Leghorns at Los Angeles, December, 1903. The greatest exhibit ever held west of the Missouri.

WHITE LEGHORNS
Our flock was formerly headed by the Prize Cock of the New York show, whose sire also won the first at New York the previous year. Of our bird, the judge said: "The best-shaped bird I ever saw; the finest tail and carriage I ever saw; the whitest bird I ever saw."
Among the choice leaders now of our flocks is Rob Roy, a most perfect specimen of extremely large, snow white birds, winner of 3 firsts at New York State Fair, and other prominent exhibitions. He is also a remarkable sire of prize winners. One of his cockerels is at present among the leading birds of the Eastern States. Romeo, a 7 lb., large, snowy white bird, winner of first at Madison Square Garden, New York's great show, and winner of first wherever shown, as well as being a remarkable sire. Similar remarks apply to Sunny Jim, a high-class large, perfect bird, from various egg producing strains of large eggs.
Best Strains, Best Birds, Greatest Layers, Largest Eggs, Up-to-Date in Every Respect.
None better. Lay more and larger eggs, 6 and not over 7 to the pound. Test yours.
To our flock of already choice birds, we have recently added some of the best birds to be found among the most famous flocks of the largest and best Eastern breeders. Selected not only for their Show qualities, but more essentially for their laying qualities of large eggs, which we have always made our strongest point in breeding or selecting. Among them is "WHITE ROSE," first pullet at Madison Square Garden, January, 1901; first prize pullet at Cortland, December, 1900; also winner of Golden Special for highest-scoring bird in Show, 96½ by Zimmer; also her two full sisters, and the first prize hen at Madison Square Garden, New York, 1903. Judge G. H. Burgott says of her in American Fancier, Jan. 17, 1903; "A typical grand bird." Also others equally good from the same pen. and the prize cockerel at the Pan American World's Fair, (we having previously owned the prize cock and infused his blood in our young stock). We now place him as a splendid addition of new stock, and one of the most perfect speeimens of true type of large pure white Leghorns to be found.
"The hens that lay are the hens that pay." Nearly all flocks of White Leghorns are the old small variety, layers of small eggs; our strain is snow white, large birds, bred for many years to lay more and larger eggs. Ours won many first prizes all over the East at biggest shows as well as Pan-American World's Fair. Such strains of White Leghorns give one-quarter more egg production, cost one-third less for feed and care than any other variety, while the large white eggs sell from 2c to 5c more per dozen. Buy a choice cockerel, the best in California, and improve your flock. Eggs for hatching.
W. W. HOWARD 3024 E. Main St. Los Angeles, Cal.

Mountain View Poultry Yards

H. C. Chamberlain, Proprietor, Cotati, Cal.

which some attention had been given by him previous to college days. Meanwhile Brown Leghorns and Barred Rocks were imported from eastern breeders and sold in small numbers by him, to people in and around Petaluma. A few years later White Leghorns were introduced.

Mr. B., having improved in health so materially and succeeded in making such a reliable hatching machine, concluded to make Petaluma his permanent home. From this beginning has been built up an immense incubator factory.

Rear View of Petaluma Incubator Factory.

Mr. Byce took us about for a short look at his big stock of incubators, finished and in all stages of construction. A big stock, did we say? "Only 3000," Mr. Byce said and that's not many when it comes to covering the world with Petaluma incubators. Nearly half those incubators are finished entire and ready for immediate shipment.

From the sloops the lumber is landed near the rear of the factory, which is on a level with the basement. Then it is cut to proper sizes and stacked for more perfect seasoning. Thence to saws and turning lathe, where it is soon ready to put together.

On the third floor are tin shops, finish rooms and "assembling" room. This last is in charge of the final inspector, who sees that lamp, thermometer, trays, ventilators, etc., are properly placed and packed, finally, at the door are placed full instructions as to seting up and operating. In the tin and copper workshops are machines for cutting and forming the metal parts, which permit of most economical work.

Around this great institution has grown up an immense business, for which Petaluma has become so noted. Since 1879 this company has expended over $125,000 in advertising Petaluma incubators and Petaluma.

Through the instrumentality of the Petaluma Incubator Co., people from all parts of the world have been attracted to Petaluma to engage in the poultry business. Property has increased in valuation. Large tracts of land have been subdivided and sold at good prices. Conditions of trade have been completely revolutionized, so that instead of the long time credit system it is conducted strictly upon a cash basis.

Driving in a westerly direction from town the very heart of the poultry section is encountered, wherein are hundreds of poultry ranches of from 1000 to 6500 laying hens, and on which six to seven thousand chicks are raised annually to keep up the laying stock. Within this section are several places where there is a concentration of fowls—owned by a number of persons but kept upon small tracts, and, viewed from a little distance look like one vast poultry farm. In some of these closely arranged localities one can see, without turning round, an aggregation of from 65,000 to 100,000 laying hens.

The annual output of this city is 2,200,000 dozen of eggs, but that is not enough to suit the Petaluma hen and it is thought that this year's output will be five million dozen.

At two bits per dozen that's not so worse for an income for one little town.

VETERINARY DEPARTMENT

BY DR. W. J. OLIVER,
109 No. th Broadway, Los Angele:

TUBERCULOSIS SYMPTOMS.

Editor Cultivator.—I have some pigs two months old on range with sow; two of them have a cough and do not seem to breathe regular. The sow has an occasional cough. I feed them scalded middlings and corn, and have been giving them Prussian stock food for a month, but it does them no good. Please advise through Cultivator.—Subscriber, Santa Rosa.

Your pigs show symptoms of tuberculosis, probably inherited from sow. Kill one and have competent surgeon hold a post mortem.

* * *

MANGE—BONE SPAVIN.

My horse is in fair condition, works every day. I feed kaffir corn; she is afflicted with some kind of itch. She rubs the hair off in spots, and the skin turns scabby and hard. Is the disease contagious? Can bone spavin be cured? If so, what is an effective remedy.—George Sinkewich.

By your description the disease is mange. Use the following: Sulphur, 2 oz.; oil turpentine, 2 oz.; oil tar, ½ oz.; oil linseed, 10 oz. Mix. Shake well and apply twice a day.

Treatment for Bone Spavin.—Firing and blistering is the only reliable treatment.

* * *

MANGY SOW.

Editor Cultivator: I have a brood sow that is troubled with mange. I have been feeding it condition powders for some time but have met with no success. Will you please give formula for remedy for same and oblige, Subscriber, Kern City, Cal.

Use the following and apply twice a day: Sulphur, 2 oz.; oil turpentine, 2 oz.; oil tar, ½ oz.; oil linseed, 10 oz. Mix. Shake well before using.

* * *

BREEDING DAY OVER.

Editor Cultivator: I have a fine cow, 8 or 9 years old. About 6 months ago she had a pair of twin calves born dead. They came two months before they should. I have no idea what caused the abortion, for she had not been driven, had not changed feed for a long time. I had been feeding green corn suckers and that was her principal feed when she lost her calves. She has not again been in heat, but is getting very fat and the flow of milk does not amount to 4 qts. per day and is gradually getting less. Please answer through Cultivator and oblige, D., Anaheim, Cal.

Your cow will not be likely to breed again. Best dry her off and fatten her for beef.

* * *

HAS TUBERCULOSIS.

Editor Cultivator: I have a cow that is a six-gallon milker. Last August, one year ago, she took to breathing very hard, and I gave her some of Sloan's condition powders, and she got better. This year I turned her in pasture and she went right off her milk. She still breathes hard at times and coughs some. She is thin in flesh but has a good appetite and of a morning her nose is dirty. She has just dropped her calf and it was small and weak. She does not give over a quart of milk now. The veins in her udder are large and the udder very sore.—J. E. Potts, Colton, Cal.

Your cow has tuberculosis.

CLIMATE AND CROP REPORT

Cool weather prevailed during the first of the week, with heavy frosts in many places. The latter part of the week was warmer and generally cloudy, with heavy rain in the central and northern sections and light rain in the south. The precipitation in the Coast and Bay sections and portions of Northern California was the heaviest of the season, ranging from two to nine inches for the storm of the 11th and 12th. Heavy snow fell in the mountain districts. Rivers and creeks were running bank-full, bridges and railroad track were washed out and overland traffic was blockaded by the heavy snow in the mountains.

There are no reports of damage to farming lands or crops by the heavy rain, but farming operations were suspended and in some places cannot be resumed for several days. Although the precipitation in the southern districts was comparatively light, its coming immediately after the rain of the preceding week was very beneficial and farmers have become more hopeful. Early sown grain and grass have made a good start and are growing rapidly. Plowing and seeding are in progress in all the southern districts. In the central and northern sections grain continues in excellent condition and pasturage is making good growth; green feed is plentiful in most places and cattle are doing well. The grain acreage is reported large.

Orchards and vineyards are in good condition and pruning is nearly completed in some sections. The cold weather has been beneficial to deciduous fruits in checking the too early development of bloom, and prospects are good for large crops. Citrus fruits have not been seriously damaged by frost.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE, CAL.

Editor Cultivator:—Will you tell me if the sterculia diversifolia is sometimes called the tulip tree? 2. What is the botanical names of the "Flame tree." 3. I want some trees for the front lawn and the driveway. What would you recommend? An answer through the Cultivator will much oblige, Interested Reader, Hollywood.

1. We have never heard the sterculia called tulip tree, though they are much alike in habit of growth. There is a deciduous sterculia (S. platanifolia) that might be taken for it. It is a strange fact that both this sterculia and the tulip tree (Liriodendron Tulipifera) are found in the southeastern United States and China, yet nowhere else on the globe. They are in no way related. 2. Sterculia acerifolia (maple leaved) an older, though less proper name is Brachychiton acerifolia. 3. Sterculia diversifolia would be most excellent for your driveway. Please send size of your lawn—if large or small trees are needed and if for shade or ornament. Have you plenty of water for them?

* * *

FLOWERS FOR DRY SITUATIONS.

Editor Cultivator.—Will you please give an addition to your last list of drought resistant plants, in the way of bedding plants? I am getting all those you guggested, but it does not give me a sufficient variety.—E. D. R, Redlands.

Amaranthus, Balsam, Godetia, Nasturtium, Zinnia (five annuals); Anthemis tinctoria, Columbine, Cone-flower, Gaillardia, Sunflowers (five perennials). These ten, added to list above noted should give one a good assortment of flowers and the plants will need little care or water.

* * *

Editor Cultivator.—I saw a mention made in the floriculture column of the Cultivator of the Kei-apple, and I would like to know more about it. 1. Will it grow and thrive without irrigation? 2. What kind of soil does it require? 3. Where can it be bought?—J. D., Fallbrook, Cal.

1. Being native to hot, dry portion of Southern Africa, we should judge that it will do very well without water except from winter rains—those we have seen were summer watered, so cannot be positive. 2. It will, no doubt, do best in a medium or light soil, likely not so well in a heavy one. 3. We do not know of any dealer in California who can supply you with them except Mr. Payne, whose ad. appears on this page. Plants are usually obtained from Florida, where they are prime favorites.

* * *

Editor Cultivator.—Will you please give the title and number of the bulletin which treats on the changing of sex of the date palms; also, if it is a State or Federal Government publication.—E. B., Mecca, Cal.

We have only seen an extract from the bulletin mentioned. If you will write to Mr. C. B. Smith, Washington, D. C., care U. S. Department of Agriculture, office of Experiment Station, and ask him where you may get "Trop. Agr. 22 (1903) No. 11," treating of the changing of sex in plants, we believe you will find what you wish.

BARREN CHERRY TREES.

Editor California Cultivator:—I have lately become a subscriber to the Cultivator and would like a little information in regard to what fertilizer to use on Royal Ann cherry trees. I have a 16-year old orchard of R. cherries that never bore one-half crop. The soil is good and the trees grow too much into wood; trees are 12 to 15 inches one foot above the ground and 30 feet high; bloom and set very full; if one in 20 of the little cherries would stay on would make a big crop; they grow to be as big as a half grain of corn, then drop off. Now, what shall I use? What kind of fertilizer is best to use? I would be pleased to hear from you and be obliged.—A. Beermaker.

It is probable that the soil on which these trees are growing is already too rich and adding fertilizer would not benefit the matter at all. The fact that the trees are growing so vigorously indicates this and shows that growing conditions are perfect. It is a common habit for the cherry, and especially the Royal Ann, where growing conditions are favorable to run very much to wood. It has been claimed that if left until they attained sufficient age they would bear very heavily and pay for the waiting, but we in California are not planting trees for our children and are very anxious for immediate returns. The greatest of all natural laws is the continuation of the species, and this law is especially strong in the vegetable world. When conditions are especially favorable for the growth of the individual seed production may be long deferred, but so soon as conditions prevail that threaten to shorten the life of that individual it is forced into bearing at once and the continuation of the race is assured. Now, this law applies to fruit trees and often by pruning, by mutilation, or other means we can stop the growth of the tree and force it into bearing. One of these processes is root pruning. Dig well around the barren tree and cut back the roots. This will check the tree and often force it into bearing. We know of a case in which a friend had a cherry that had attained so great an age without bearing that he determined to get rid of it and started to cut it down with an ax. He made two or three deep cuts in the trunk when he was called to lunch, and during the lunch hour his wife begged him to leave the tree for its shade, as it stood near the house. He did so and was surprised the next season to get a very heavy crop of fruit from it and it has borne ever since. Mutilating a tree in any way, as by driving nails in it, allowing borers to get in, etc., will cause it to bear in accordance with the law mentioned above, but all such means are at the expense of the vitality of the tree. Probably if our correspondent will neglect his trees he will get better results than by the application of fertilizers.—John Isaac.

Hollywood Rose Co.

J. L. DUNSCOMB, MGR.
PROSPECT PARK P. O., CAL.

—ROSE BUSHES EXCLUSIVELY—

If you want the best in rose bushes, go to the specialist who does one thing well. We grow and handle only such roses as do best in this climate. All bushes sold are sturdy, vigorous thoroughly dormant, and will bloom within a few months.

LARGEST BEANS IN THE WORLD.

A California correspondent of the Scientific American states, says the San Joaquin Farmer, that the largest string beans in the world may be seen growing in the gardens of Charles Richardson at Pasadena. They range from thirty to forty-three inches in length and average half an inch in width. They are not only enormously large but they make a delightful table delicacy when cut and stewed and prepared with cream and butter. The commercial gardener would find them a most profitable production, for the vines bear profusely and the beans are so large that one of them is more than a single person can comfortably manage.

These beans are of an aristocratic species and do not claim alliance with the common string bean. California botanists class them as belonging to the genus Dolichos, but owing to their great length they are more properly known as "yard beans." The plants are natives of China annd Japan and the seeds were sent to Mr. Richardson from Japan.

Early in the spring he planted them in a well spaded, well fertilized trench and put up a trellis seventeen feet in height to support the vines. The seeds sprouted quickly and the plants began to grow with a vengeance. They climbed to the top of the poles and then turned around and began to grow backward. They are now twenty-five feet in length and are still growing. The row is thirty feet long, containing fifty vines, and it has been estimated that the crop amounts to ten thousand yards of beans. The beans grow in clusters and can be easily and quickly gathered. The fragrant lavender blossoms resemble those of the sweet pea. They are peculiar in their habits, living but for a day, opening with the sun and dropping their petals when the sun goes down. The leaves are long and wide and grow in clusters of three. The vines are very clean and attractive and would be decidedly ornamental in any summer garden for either fence or trellis covering. The beans are best for eating when about twenty inches long. In flavor they excel that of the ordinary string bean."

HOW HE IMPROVES HIS FARM.

"You ask how to bring up a farm? Every farm is a study by itself," replied John Joy. "The best I can do is to tell you how I improved my own farm, from where it barely paid the rent until now it gives me $800 per month gross income, of which about $200 is the clear profit."

"Few men of your age in this section have done so well," said I, "and the farm was nothing extra by nature."

"I was a believer in manure," he continued. "I knew that with plenty of it anybody could make money on an eastern farm. The first five years I paid rent first, bought food next, and put the rest of the income into manure; paid a good price and hauled it three miles over a bad, hilly road. I often wished I had located nearer town. Before the end of five years I found that I could keep more stock, and quit buying manure.

I have bought none since, except a ton or two of fertilizer a year for potatoes. I have kept adding cows, and my wife became tired of making butter, so I started my retail milk route. I had to buy grain to keep up the milk flow, and the land grew richer. I began to study tillage, got better implements, plowed better and oftener, and fined the soil the whole season.

I paid more attention to rotation of crops, and practiced a partial soiling system, which I thought was about the limit of high farming; but then came the silo system."

"That seemed to make a big difference in your farming. Yours was almost the first in this country, I believe."

"Yes," replied Joy. "I should have had one sooner if mine had been easy soil to cultivate. The silo has done a great deal to bring up my farm. I could keep twice as many cattle as before, but I haven't done it, because I have been taking more of the land for garden crops and trees. I have made some of my fields as rich and mellow as a garden, and find it pays to raise garden crops and fruit.

"Now, this is the standard way to bring up land," he continued; "that is buy or make more manure. But if the milk or butter market were poor, my experience has suggested another way that you could follow, one that is more feasible in some instances. Manure, live stock and silo cost heavily, and the process for a man without much capital is slow and difficult.

"With a large farm and little or no capital, a farmer may set that surplus land to improving himself. Let him wisely save and use what manure he has. There is a golden mean between stuffing and starving land. Let him put the manure where it will do the most good, using the best of the land, grow self-feeding crops like clover, cow peas and soy beans, and the like. By 'self-feeding' crops, I mean that they get a good deal of their growth from the materials in the air and deep soil, where most crops will get nothing. Where land is easy to work, these crops will not cost much to grow. They can be pastured off partly, and the rest of the growth plowed under.

"Red clover, for instance, I find we can cut or feed the first growth, and get a crop that will pay for the trouble of raising it and leave the second growth to be plowed under, with the effect on the soil's quality, a heavy dressing or fertilizer after plowing under the soil, or carry a crop of potatoes, with the addition of a little fertilizer in the drill. Then follow the potatoes with fodder, rye, or wheat, and sow clover again among the rye early the following spring and so repeat the process. Plow under the second growth of clover again, and the land will be found wonderfully improved, at no great expense except for labor.

"Another good plan the second fall would be to sow some turnips with the rye. This would give five crops in two years. A crop of clover cut, and the second growth turned under, potatoes, turnips, rye, and all with little manure. I should use chemical fertilizer, say 200 pounds per acre, of muriate of potash and acid phosphate mixed, to give the clover a good start.

"But I would never mortgage my farm to buy heavy dressings or fertilizer, as some recommend. I would rather take longer and depend more on the clover. I would get a double sulky plow and turn the soil over and over as often as I could, working it fine and keeping it stirred. Almost any soil has plenty of fertility if it is worked fine enough to enable the crops to get at it.

"Live stock, fine tillage, and air feeding plants will bring up the farm in time. A mortgage might save years, but it would be likely to work as many out of the farmer's life.—Correspondent American Agriculturist.

SALZER'S FARM SEED NOVELTIES

Salzer's National Oats.
Most prolific Oats on earth. The U. S. Dept. of Agriculture, Washington, says: "Salzer's Oats are the best out of over four hundred sorts tested by us." This grand Oat yielded in Wisconsin 156 bu., Ohio 187 bu., Michigan 231 bu., Missouri 255 bu., and North Dakota 310 bu. per acre, and will positively do as well by you. Try it, sir, and be convinced.

A Few Sworn to Yields.
Salzer's Beardless Barley, 121 bu. per A.
Salzer's Homebuilder Corn, 304 bu. per A.
Salzer's Big Four Oats, 250 bu. per A.
Salzer's New National Oats, 310 bu. per A.
Salzer's Potatoes, 736 bu. per A.
Salzer's Onions, 1,000 bu. per A.
All of our Farm and Vegetable Seeds are pedigree stock, bred right up to big yields.

Salzer's Speltz (Emmer).
Greatest cereal wonder of the age. It is not corn nor wheat, nor rye, nor barley, nor oats, but a golden combination of them all, yielding 80 bu. of grain and 4 tons of rich straw hay per acre. Greatest stock food on earth. Does well everywhere.

Salzer's Million Dollar Grass.
Most talked of grass on earth. Editors and College Professors and Agricultural Lecturers praise it without stint; yields 14 tons of rich hay and lots of pasture besides, per acre.

Salzer's Teosinte.
Salzer's Teosinte produces 113 rich, juicy, sweet, leafy stocks from one kernel of seed, 14 feet high in 90 days; yielding fully 80 tons of green fodder per acre, doing well everywhere, East, West, South or North.

Grasses and Clovers.
Only large growers of grasses and clovers for seed in America. Operate over 5,000 acres. Our seeds are warranted. We make a great specialty of Grasses and Clovers, Fodder Plants, Corn, Potatoes, Onions, Cabbage, and all sorts of Vegetable Seeds.

For 10c in Stamps
and the name of this paper, we will send you a lot of farm seed samples, including some of above, together with our mammoth 140 page illustrated catalogue, for but 10c in postage stamps.
Send for same to-day.

QUIT WORRYING.

No matter how the clouds may drift
While scurrying
Across the sky. The winds will shift
And blue come laughing through the rift—
Quit worrying.

No matter what the crowd may say
While hurrying
Along the way. A brighter day
Is lingering along the way—
Quit worrying.

No matter how the winds may blow
While flurrying
And scurrying. We ought to know
That brighter things are here below,
They're brighter still where we should go—
Quit worrying.
—New Orleans Times-Democrat.

MY OWN.

I knew a joy like a singing bird
That every pulse of my being stirred;
But no cage had bars that could stay her flight,
No way was too dark for her pinions bright;
I have missed the joy from my pathway lone,—
Across the bar I shall find my own.

I had a hope like stars agleam
That smile in the heart of a lowly stream;
But the waters were lashed to a curtain of foam
That shut the star from its earthly home;
Away in the light of the Great White Throne
With its circle of stars I shall find my own.

There are snow-white sails that wafted prayer,
Lilies too white for our tainted air;
Songs with meaning too large for speech;
Lips that sadly our hearts beseech;
Where all earth's jangles have clearer grown,
In the light of the dawn I shall reach my own.
—Julia May Williamson.

HER CHAPTER OF PROPOSALS.

Miriam came into the library and sat down opposite Graham. There was a pucker of anxiety on her forehead.

"Barry," she said, "would you mind being engaged to me?"

Graham took his feet off the window sill and sat up.

"Engaged?" he repeated, dubiously.

Miriam nodded.

"It's only for a couple of days," she hastened to reassure him. "Mr. Forsythe is coming to propose and I'm at my wits' end. I haven't a single excuse for refusing him. He's good, and wealthy, and nice looking. Mother won't hear an objection, even his age. So, you see, the only way is to let him understand, ever so delicately, that I'm not free to listen to him. Nobody will know, for he isn't the sort to repeat confidences."

Graham lay back in his chair and surveyed her coolly.

"If you've no objection to him, why don't you marry him?" he inquired.

"I thought I made it clear that I did not want to," she explained, with a note of injury in her voice. "I'm sure, of you don't want to help me out, Bart, you needn't. But we've been such chums I thought you'd as lief as not. I'd do as much for you."

Graham swallowed hard, but she did not notice.

"Why don't you tell him the truth?" he said at last. "He's man enough to stop his attentions if he knows they're unwelcome.

"That's just it," she rejoined, hopelessly. "Mother has tacitly given him to understand that I do care for him, for all of my seeming indifference. In fact, they've done nearly all the courting themselves."

Graham's lips curled.

"Well!" he said shortly, "I should think you could disabuse him of the idea easily enough."

Miriam's brown eyes widened.

"You must think it is prime fun, Bart Graham, to boldly tell a good friend right to his face that you don't care for him, especially when he's such a dear old fellow!" she said, with a little quiver in her voice.

Graham stared. What a refreshing phase of womanhood! Then he smiled grimly.

"So, I suppose, it was your idea to let Forsythe down easily by giving him to understand that, although I held your hand, your heart responded to him, eh? You'll pardon me, Miriam, but you remind me forcibly of the Irishman who was too tender hearted to dock his dog's ears at one fell stroke so cut off a half inch at a time."

Miriam winced, reddening. The truth sounds so different, stripped of picturesque phrases. Graham relit his cigar.

"You want me to go in with you, virtually lying to Forsythe," he went on gravely. "At the risk of appearing ungallant, I am afraid I must decline your flattering offer. I don't know much about such things, but it seems to me, if I didn't care to go into partnership with a man I could make him understand my refusal had nothing to do with my personal regard for him. If—if I didn't want to marry you, for instance, Miriam, you wouldn't take it as unfriendliness on my part, would you?"

Her downcast eyes missed the fact that he was watching her narrowly. She got up.

"I don't know if I've the nerve to do it," she said, rather tremulously, and letting his question pass unheeded. "You've no idea how hard it is, Bart. I've always liked him, if not in that other way, so very much, till—till"

She hesitated and looked at him appealingly; but there was no sign if relenting in his averted face. She sighed softly. A moment later he heard the swish of her light skirt along the hall. He laid down his cigar.

"In one respect," he groaned, "women are like Providence—their ways are past finding out!"

On the morning of the third day, from the vantage point of his own window, he saw the suitor depart. There was a rosebud in the lapel of his faultless coat. As he got into the autobus Graham caught a glimpse of his face. His own promptly fell. As if that were not sufficient, on going out directly after, he met Miriam's mother in the hall. The pretty widow's cheeks were flushed like a girl's, and, it seemed to him, there was a guilty look in her eyes. She gave him a smile that relaxed not a tone of its sweetness at the savage tone of his "Good morning." This last confirmed his worst forbodings; he decided that, between the two, they had succeeded in coercing Miriam to their wishes.

He went back to the house and sent a peremptory note to the young lady. He wished to see her once more, and at her earliest convenience. He thought their former close friendship gave him the privilege.

He was hardly prepared for the flushed cheeks and defiant eyes that greeted him. Nevertheless, he resolved to stick manfully to his role of protector.

"If it came to this, Miriam!" he burst forth, "I think you might have trusted me to help you out, for all I refused the other day! I would have done anything but what you asked—even to shooting him," savagely.

Miriam's nervous color deepened.

"—I don't see how any one could have helped it, except mother," she stammered.

"I could, and I intend to yet," he retorted grimly. He came a step nearer. "I tell you, child, you shall not be forced into this marriage against your will. I have some rights as—as your nearest friend, and I shall remonstrate with your mother. That failing, I shall go to Forsythe himself, and tell him the truth, since you dare not. He is an honorable man, and he will release you."

Miriam backed away from him and hid her face in her hands.

"Oh, Bart!" she cried between hysterical sobs and laughter. "What in the world are you talking about?"

"You shall not marry Forsythe against your will," he insisted. Then, to his astonishment, Miriam uncovered her face and burst into a ringing laugh of sheer relief.

"It was mother, not me, to whom he proposed," she said. "It was just her silly blunder, the blessed goose! She never told me they were engaged years ago. And I acted such a guy before you. I fretted myself sick about it. But," meeting his eyes with unwonted and bewildering shyness, "if he had asked me, Bart, I should have told him the truth. I've resolved to be as honest as the day hereafter."

Graham's head swam in the great light breaking on him. Impulsively he strode forward and took both her hands.

"Miriam, be honest with me, then, as I am with you. I've loved you all the while I was pretending friendship, and when I thought another man was winning you I was beside myself with misery. Tell me, little chum, could you love me in that other way?"

The flushed face was instantly buried against his sleeve. Graham as promptly unearthed it, and forced its shy eyes to meet his again. What he saw there only he knows; but it proved to him beyond a doubt that Miriam's impersonal friendship was as preposterous a fraud as his own.—Minneapolis Times.

BABY'S CARE AND COMFORT.

An experienced housewife who has raised several children is a better authority on the care and bringing up of the baby than text book or any trained nurse. How to look after the little personage, keep him or her free from colds, and therefore healthy and growing, are items of interest to every young mother. Writing on this subject a trained mother in Farmer's Wife makes these timely suggestions:

When you are ready to give the baby his bath, have the tub set on a box or something that will make it a convenient height for the mother as she sits in her chair. A folding screen is a great convenience. It is easily adjusted around a warm corner, and if the door is opened the baby is out of the draft. This screen may be made of a wooden clothes horse by fitting the panels with curtains of muslin, dimity, chintz or cretonne. These may be removed when they need washing. The lower rungs of the screen are convenient for hanging the towel and clothing on, placing them within reach when needed.

Pour the water, which should be heated to the proper temperature, in the tub. Dissolve a tablespoonful of powdered borax in two gallons, which makes it soft and cleansing. A bath thermometer is almost indispensable, as the sense of touch cannot be depended upon. Set the baby in the tub and wash the whole body quickly, using a

LAMP-FITS.

How do you know what chimney fits your lamp?
Your grocer tells you.
How does he know?
He don't.
Do you then?
That's about how lamps are fitted with chimneys by people who don't use my Index; and they complain of bad chimneys! Lamp-Fits indeed! Do you want the Index? Free.

soft silk sponge, which cleanses without irritation. Very little soap is needed, but it should be of the best quality. When he is washed, spread a bath towel in your lap, lift him out upon it, and wipe him dry with a piece of soft linen. Any places that seem in danger of chafing should be dusted with a powder made by thoroughly mixing ten parts talcum powder and one part boracic acid. Replace the clothing quickly, and he will be ready for a quiet refreshing sleep.

Babies should be put to bed early. Undress him and rub him gently all over the body, then put on a long loose night dress of outing flannel or some other suitable material. If he is in a room where there is a light, see that it does not shine in his eyes. The room should be kept the same temperature as nearly as possible, all the time."

CAUSE OF COLDS.

The invariable cause of colds comes from within, not without. No one takes cold when in a vigorous state of health, with pure blood coursing through the body, and there is no good reason why any one in ordinary health should have a cold. It may come from insufficient exercise, breathing of foul air, want of wholesome food, excess of food, lack of bathing, etc., but always from some violation of the plain laws of health.

There can be no more prolific cause of colds than highly seasoned foods, as well as frequent eating. These give no time for the digestive organs to rest, and incite an increased flow of the digestive secretions. Thus larger quantities of nourishment are absorbed than can be properly utilized, and the result is an obstruction, commonly called a "cold," which is simply an effort of the system to expel the useless material. Properly speaking, it is self-poisoning, due to an incapability of the organism to regulate and compensate for the disturbance.

A deficient supply of pure air to the lungs is not only a strong predisposing cause of colds, but a prolific source of much graver conditions. Pure air and exercise are necessary to prepare the system for the assimilation of nutriment, for without them there can be no vigorous health. The oxygen of the air we breathe regulates the appetite as well as the nutriment that is built up in the system.

The safest and best way to avoid colds is to sleep in a room with the windows wide open, and to remain out of doors every day, no matter what may be the weather, for at least two hours, preferably with some kind of exercise, if not more than walking. One should not sit down to rest while the feet are wet or the clothing damp. A person may go with the clothing wet through to the skin all day, if he but keeps moving. Exercise keeps up the circulation and prevents taking cold.

The physiologic care of colds is the prevention of their occurrence. The person who does not carry around an oversupply of alimentation in his system, and furthermore secures a purified circulation by strict sanitary cleanliness, thus placing himself in a positive condition, is immune to colds. A starving man cannot take cold.

A careful diet would exclude the use of all narcotics and all food that is not thoroughly appropriated. An overfed person is worse off than one who is underfed, because the overfed body is taxed to dispose of what cannot be appropriated, and when not properly disposed of, remains only to be an element of danger.—Science and Health.

THE JOY OF LIFE.

There are untold sources of good at the command of every living soul. We have only to put ourselves in line to avail their possibilities. The sun-kissed earth is full of the glory of living. We need but to drink in its beauties to be keenly sensible of a heaven on earth. The banquet table is laden with the choicest viands. We need but to partake of them; they are free to all. Listen and you will hear the summons to the feast. It is ringing, ringing around the world. It is the call to every human soul to partake without money and without price. Open your eyes and look about you and you shall see the good and the beautiful ever emanating in choicest vibrations direct from the infinite hand. Open your minds and into them shall flow all that is desirable, all that is best in the economy of nature; and nature is God. Seek only the sunshine and you'll be sure to find it. Having found it, bask in it.

Drummond said "the best thing in the world is love."

Why?

Because it opens the heart to sunshine. Sunshine is life. Life is eternal, sunshine everlasting. Said Rabbi Rosenan, "Sunshine is beauty." Surely there is beauty in sunshine. All nature teaches us that. The firmament with its constellations, the earth with its luxuriance; the ocean with its never ceasing billows, which break in music and in grandeur on the shore; the brooks with their tinkling and their babbling; the mountains with their magnificence, and the verdant valleys with their foliage and the fields with their burden of bending grain; the birds with their songs, and the insects with their humming, all, all teach you the lesson of the sweetness of life.

"The best thing in the world is love."

There is sunshine in love. The father with his deep-seated affection for his daughter, the mother with her eternal devotion to her boy; the brother with his unselfishness toward his sister, and the sister with her admiration for her brother ever impresses you with the truth that there is indeed sweetness in life.

"There is sunshine in opportunity," said Beecher. "The prize of success is within everybody's reach. Do not the law, with its protection, and religion, with its direction; education, with its knowledge, and association, with its discipline; industry, with its achievement, and rectitude, with its commendation; hope, with its encouragement, and ambition, with its daring, ever make you realize that life is grand?" The trouble is we don't appreciate our opportunities, we let them glide unnoticed through our fingers and then lament the fact that they did not come to us. They are always coming to others, but to us never. We missed them, that was all. The sky may be dark, but if we look we shall see the silver lining to the clouds. And as we look the longer the silver will grow brighter, bigger, until at last the darkness will disappear and the sunlight of beauty burst upon our vision as the sunshine of morning breaks over the mountain tops. Let us look for the sunshine, making life a paradise of beauty so that the poet may not be justified in singing

Some murmur when their sky is clear
And wholly bright to view
If one small speck of dark appear
In their great heaven of blue.
And some with thankful love are filled
If but one streak of light,
One ray of God's good mercy, gild
The darkness of their night.

In palaces are hearts that ask,
In discontent and pride,
Why life is such a dreary task
And all goods things denied.
And hearts in poorest huts admire
How love has in their aid
(Love that not ever seems to tire)
Such rich provision made.

PLEASANT CORNERS.

"Why, auntie," we exclaimed, as we found the dear old lady out of doors, "you are putting some of your choicest rose-bushes away out here in the back yard?"

"Yes; and I'm going to put geraniums and pinks and other things that will bloom all summer out here, too, child," and a more tender look dimmed the twinkles in the kindly eyes, while she nodded toward an upper window in the dingy wall of a tenement-house opposite.

"I know they'll be sort of out of sight from our house, but there's a woman sits sewing at that back window day after day, week in and week out, and I'm fixing this corner for her. No, I don't know her, only she's always busy and tired-looking, and maybe the flowers will put a bit of brightness into her life."

Who can tell what memories, what hopes, what lessons, the beauty of the blossoms and their fragrance bore to that poor little upper room through the long summer days? And how many ways there are of making pleasant corners to gladden tired eyes if only we were not too selfishly busy to notice the eyes or plan the corners!—American Mother.

RECIPES

Eat Little, but Have That Little Good

LEMONS.

The value of lemons in the culinary department cannot be overestimated. In addition to their piquant flavor, they possess medicinal virtues to a marked degree. The citric acid which they contain, however, should never be drank undiluted, as it tends to injure the lining of the stomach, but when weakened with water no ill effects need be feared. The following recipes are from "Culinary Art," a valuable little booklet issued by the ladies of Pasadena, Cal.:

* * *

Lemon Sponge Cake.—Three eggs, 1 cup sugar; beat yolks and sugar; add 3 tablespoons water, 1 teaspoon lemon extract, 1 teaspoon baking powder in 1 cup flour. Lastly add beated whites of eggs.

* * *

Lemon Sponge.—One-half box gelatine, 2 cups sugar, 4 eggs, 1 pint boiling water, 3 lemons; cover gelatine with one half cup cold water and cook for one-half hour. Then pour on it the boiling water, add the sugar and stir until dissolved. Add the lemon juice and strain into a basin. Set in a pan of cracked ice to cool until it thickens, then add the well beaten whites of eggs and turn into molds to harden. Serve with a sauce made with 1 quart milk, yolks 5 eggs, 4 tablespoons sugar, 1 teaspoon vanilla.

* * *

Lemon Sauce.—Beat together two tablespoons butter, 1 cup sugar, and 1 teaspoon flour; add one-half cup boiling water; cook until clear, flavor to taste with juice and grated rind of 1 lemon.

* * *

Lemon Pie.—One and one-half cups granulated sugar, 3 eggs, 3 tablespoons cornstarch, 2 cups (scant) boiling water, 1 lemon; beat sugar, eggs and lemon together. Stir corn starch in cold water, put in and boil; beat whites of eggs to stiff froth, and add 2½ tablespoons pulverized sugar. Bake the crust first, then put in the custard, frost and bake a few minutes.

To remove iron rust from linen, moisten with lemon juice, sprinkle with salt and lay in sun. Repeat if necessary.

If color is taken out of carpets or wearing apparel by an acid of any kind, a few drops of ammonia on the spot will restore the color. If the spot has been made by an alkali, lemon juice will restore the color. The application must be made before the goods have been wet.

A two-year old orange tree grown by Mill & Masters

A BEARING ORCHARD AT TWO YEARS.

Oranges will hardly reach full bearing condition at two years, and we do not suppose any nurseryman would claim it for his trees. But at the same time, the engraving given on this page of a two-year-old orange tree, shows that sufficient size may be secured to grow something of a crop. This engraving is from a photo taken by the Cultivator photographer a few weeks ago and the tree is only one of thousands in the orchard, nearly every one is thrifty as this one. Less than two years ago they were planted and yet they look four.

How was it done?

That's dead easy—like getting rich, all you want is planty of money.

Growing a fine orchard is helped wonderfully by a fine large nursery tree. Helped? Yes, it is essential. Though, of course, careful planting, irrigating and culture must follow.

The young orchard tree shown on this page was a strong growing nursery tree. It was grown by a nurseryman who thoroughly understands growing nursery trees.

This particular tree was from the nursery of James Mills and was grown on Arlington Heights near Riverside.

He has more equally as good.

I WILL GIVE $1000

IF I FAIL TO CURE ANY CANCER OR TUMOR

I treat before it Poisons Deep Glands or Attaches to Bone.

NO KNIFE OR PAIN, NO PAY UNTIL CURED.

NO X-RAY OR OTHER SWINDLE.

A Pacific Island shrub or plant makes the cures—the most wonderful discovery on earth to-day. **3000 CANCERS** cured on people you can see and talk with. **ANY TUMOR, LUMP OR SORE** on the lip, face or anywhere six months is, *nearly always*, Cancer. Poor cured free if cancer is very small on face.

ANY LUMP IN WOMAN'S BREAST IS CANCER

It does not pain until almost past cure, and if neglected it **ALWAYS** poisons the deep glands in the armpit, then it is often too late and still no pain. Deep in the shoulder death is certain. In 30 years I have cured more cancers than any other Doctor living. **INVESTIGATE MY ABSOLUTE GUARANTEE. BE SURE TO GET MY 180-PAGE BOOK,** sent free, with symptoms, addresses and testimonials of thousands cured, and write to them.

Los Angeles Markets.

Los Angeles, Feb. 18, 1904.

The local markets have shown much activity during the past week. Nearly everything in the produce line has advanced, owing to the slow receipts during the Chinese New Year. The recent rains will have no immediate effect on the prices now prevailing. It is rumored by local dealers that Japan's agents are commencing to buy provisions. If this is the case, the growers will have no trouble in disposing of their products at a good figure.

The following are the prices quoted by wholesale dealers:

Butter.

All grades remain firm at last week's prices.

B. of T. Creamery, 2lb roll		70
So. Cal. dairy do	60	62½
Cold Storage	50	55
Cooking, lb.,	21	23

Cheese.

Best grades are in fair demand with 1c advance.

Cal. and 3 lb. hand	18	
Cal. Downey and Anchor	17	
Swiss	19	
Imported do	28	

Eggs.

Fresh ranch are holding their own. Dealers are not crowded. The largest supply now comes from local producers.

Fresh ranch	23	24
Store, case count	22	23

Poultry.

Young chickens and ducks are very scarce, being firm at the prices heretofore quoted. Hens plentiful.

Spring chickens, per lb	17	20
Hens, No. 1 per lb.	14	14½
Ducks, per lb	14	15
Turkeys, per lb	20	22
Turkeys, cold storage	22	23

Live Stock.

Beef cattle are moving freely. Hogs and beeves are selling a shade higher than previously quoted. A still further rise is in evidence.

Hogs, per cwt	5 50	5 62½
Prime steers, cwt	3 75	4 25
Cows, cwt	3 00	3 50
Heifers, cwt	3 00	3 75
Sheep, ewes, per head	3 00	4 00
Lambs, do	3 00	3 50
Wethers, do	4 25	4 50

Potatoes.

Good stock are firm at prices quoted.

River, per cwt		1 50
Oregon, do		1 70
Local, do		1 50
Local White		2 25
Local Sweets, white		3 00

Vegetables; Mixed.

A great shortage on all fancy goods is feared by local dealers for the next few weeks. Cabbage and beets are very scarce, being quoted 25 cents over last week's prices. Tomatoes were heavily damaged by the late frosts. There are practically none but storage goods on the market.

Onions, yellow, per cwt.	2 55
Beets, per 100 lbs	1 25
Cabbage, per cwt	2 00
Green Peas	06½
Lettuce, per sack	40
Tomatoes, 25 lb crate	2 00
Celery, per doz	50
Hubbard squash, per ton	20 00
Carrots, per sack	1 00
Chiles, string	75
Cauliflower, doz	75

CITRUS FRUITS; FRESH

Little change has been made in the fruit lines of late. Navel oranges are quoted as follows:

Fancy, 126s, per box	2 00
Do, 150s	1 50
Do, 176s,	1 25
Do, 200s,	1 00
Standards	50
Lemons, fancy, per box	1 50
Standard, do	75
Grape Fruit	1 25
Limes, per 100	90 1 25

DECIDUOUS FRUITS FRESH

Four-tier Belleflower	1 75
Four ½ tier, do	1 50
Pears, Winter Nellis 40lb bx	2 00
Northern apples, 40 lbs.	1 00 1 50
Strawberries, bx, fancy.	07 12
Grapes, per crate	3 00 4 00
Guavas	04 05

Fruits; Dried.

Apples	05½ 06
Apricots	08 09
Peaches	07½ 08
Raisins, per box	3 00
Raisins, loose	07 08½
Prunes	03 06
Pears	10

Beans, Dried.

Knowledge of the condition of the bean stock of the State, the unusual shortage in crops and storage for the past year, taken with an increased demand at this time centers the interest of produce dealers on that commodity. The feeling now prevails that a further advance will take place soon. Quotations are as follows:

Pink, per cwt	3 40 3 60
Lady Washington,	3 25 3 40
Limas	3 50 4 00
Small White	3 40 3 60

Nuts.

Almonds, paper shell	14
Almonds, soft shell	13 13½
Walnuts, soft shell	14 14½
Walnuts, hard shell	13½ 14
Peanuts, eastern	06 07
Peanuts, California	05 05½

Hay and Grain.

The rain relieves the feeling of anxiety of local dealers relative to the outlook for hay. It is entirely too soon to predict the outcome so far as the farmers' position is concerned regarding the disposal of their hay on hand, but dealers assert that a decline in price may be looked for soon.

Alfalfa	16 00
Tame Oat	16 00
Barley hay	15 00
Wheat Hay	15 00
Wheat	1 35 1 45
Barley	1 10 1 15
Oats	1 25 1 35
Corn	1 20 1 25

Mill Stuff.

Quotations f. o. b. cars L. A. are:

Rolled barley	1 30
Bran	1 30
Feed Corn Meal	1 50
Middlings	1 45
Cracked Corn	1 45
Oil Cake Meal	1 85
Chicken Wheat	1 65
Cocoanut Meal	1 50

San Francisco Markets.

Dairy.

San Francisco, Feb. 18, 1904.

Butter buyers operated with considerable caution this week and with free supplies offering and heavy holders inclined to urge business by accepting shaded rates, the market assumed an unsettled tone and conditions generally favored the buying interests.

BUTTER—Per lb:

Creamery, extras	29
Creamery, good to fancy	26 @28
Dairy, extras	24 @25
Dairy, choice	21 @23
Store	14 @16
California storage	21 @24
Eastern Creamery	Nominal

Eggs and Poultry.

Offerings of Eggs were heavier and the market was easier, with values for Ranch a point lower. The top quotation was the ruling rate for fancy, but 26c was still exacted for a few lots of large selected whites.

EGGS—Per doz:

Ranch, selected large	25
Ranch, good to choice	24
Store	23 @24
California storage	Nominal
Eastern	Nominal

POULTRY—Old Roosters, per doz., $5.50@6; young Roosters, $6.50@8; Fryers, $6@6.50; Broilers, large, $5@5.50; small, $4.50@5; Hens, small, $5.50@6.50; large, $6.50@7.50; Ducks, per doz., old, $5.50@6.50; young, $6.50@7.50; Live Turkeys, per lb., 15@17c; Dressed Turkeys, per lb., 18@22c; Geese, per pair, $2@2.25; Goslings, $2@2.25; Pigeons, per doz., old, $1.25@1.50; Squabs, $2.25@2.50.

Fruits and Vegetables.

Routine transactions in Oranges constituted the principal movement this week, and in the absence of new features, quotations throughout the list remain unchanged.

DECIDUOUS FRUITS—Apples, per box, common to choice, 50c@$1; fancy, $1.25@1.50;

extra, $1.75@2.

Pears—Per box, Winter Nellis, $2@2.50.

CITRUS FRUITS—Per box: Oranges, Navels, fancy, $1.25@2.25; choice, 75c@$1.50; standard, 50c@$1, according to size; Seedlings, 50@90c; Lemons, $1@2.50; extra, $2.75; Grape Fruit, $1.25@2.50; Tangerines, 75c@$1.25; Limes, $6@6.50.

A continued firmness exists in the market for Potatoes, although no important business is reported, current trading being restricted almost wholly within jobbing confines.

VEGETABLES—Asparagus, per lb., 50c; Tomatoes, per box or crate, southern, $1@1.50; Rhubard, per lb., 9@10c; Green Peppers, per lb., 16@17½c; Dried Peppers, Stockton, 5@8c; southern, 8@12½c; String Beans, per lb., 15@17½c; Wax, ——; Green Peas, per lb., 4@6c; Egg Plant, per lb., 20c; Summer Squash, per box, $1.25@1.50; Cucumbers, hothouse, per doz., 50c@$1.50; Mushrooms, per lb., 15@25c; Garlic, per lb., 5@7c.

POTATOES—Per ctl.: River Burbanks, 95c@$1.10; Early Rose, 95c@$1.10; River Reds, $1@$1.10; Garnet Chile, 90c@$1.05; Salinas and Lompoc Burbanks, $1.40@1.65; Oregon Burbanks, $1.10@1.30; Tomales, 95c@1.05; Sweet Potatoes, $2@2.15.

ONIONS—Per ctl.: Oregon, $2.15@2.25.

Dried Fruits, Nuts, Etc.

A moderate jobbing interest is displayed in the leading descriptions of Dried Fruits and with current offerings light, the prevailing prices are well sustained. Pears are closely cleaned up, as are choice and standard Peaches. There are still plenty of Prunes and Raisins to be had.

DRIED FRUITS—Prices for carload lots f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 4@6c; Sun Dried, 3½c @4½c.

Apricots—Royal, fancy, 9¼@10c; choice, 8½@8¾c; Moorparks, choice, 10@12c.

Peaches—Choice, 5@6c; fancy, 6¼@7c; peeled, in boxes, 11@14c.

Pears—Choice, 7½@8½c; fancy, 9½@10c.

Plums—Pitted, 6@9c; unpitted, 2c.

Prunes—Four sizes, 60s to 100s, 2½@3c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Red, 4@5c.

Figs—White, 4@5c; Black, 4@4½c.

NUTS—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Pecans, 11@13c; Pinenuts, nominal; Peanuts, Eastern, 6@6½; do, California, nominal; Brazil, 11@12c; Filberts, 10@11c; California Walnuts, soft shells, No. 1, 13@14; do, No. 2, 11@12c; hard shells, No. 1, 12@13c; do, No. 2, 10@11c; Hickory, 8@10c Chestnuts, Italian, 9@10c; Coacoanuts, $4.50 $5.00 per hundred.

HONEY—New Comb, per lb., White, 10@12c; Amber, 8@10c; Extracted Water White, 5½@6c; Light Amber, 5@5½c; Dark Amber, 4½@5c.

BEESWAX—Per lb., 26@28c.

Hops.

The price for the new crop is 27@30c per lb, according to quality.

Beans.

Trading in beans generally has been limited during the week. Prices unchanged.

BEANS—Prices per ctl: Large Whites, $2.45@2.60; small do, $2.90@3.10; Pea, $3@3.25; Dried Peas nominal.

Live Stock.

Firmness exists in the markets for all kinds of Live Stock and supplies of desirable offerings keep closely cleaned up at the maximum quotations. Hogs are finding an active call and fancy hard grain fed stock, of average weight, readily commands the advanced rate. Cattle are strong, with A1 steers sharply competed for.

CATTLE—No. 1 Native Steers, 8½@9c; second quality, 8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6¼@6¾c; second quality, 5½@6c; thin Cows and Heifers, 3½@5c;

CALVES.—Light, per lb., 4¾@5½c, gross weight; heavy, 4¼@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 4½@5c per lb., gross weight; Ewes, No. 1, 4@4½ gross weight

HOGS—Per lb. Hard grain fed, weighing alive 130 lbs and over, 5½; market tending upward.

LAMBS—Spring Lambs, $2.50@3 per head or 4¾@5¼c per lb., live weight.

Hay and Feed Stuffs.

HAY—Per ton: Wheat, $15@18; Wheat and Oat, $15@18; Oat, $15@17; Barley, nominal; Clover, $13@14.50; Alfalfa, $11.50@13.50; Stock, $12@13.

STRAW—Good to choice, per bale, 60@75c.

Eastern Markets.

Grain and Produce.

CHICAGO, Feb. 17.—Wheat at the opening was about steady on the comparatively firm tone of cables, foreign markets showing no response to the decline here yesterday. Initial sales of May were a shade lower to a shade higher, at 96½@96⅝c, while July was a shade lower to a shade higher at 87¼@87½c. Selling by the principal long, followed by profit-taking by smaller holders, carried May down to 96c. July sold off to 86⅝c. Toward the noon hour the traders were seized by an acute attack of war fever. A report was circulated that an uprising had started in the Balkans. From the moment this announcement was made until the close of the session, there was an urgent demand for both May and July wheat. There was a scramble among shorts to cover, and the leading bull houses bought freely. The trade was of such large volume that individual transactions were allowed to pass almost unnoticed. The market turned suddenly strong, and sharp advances were made in all deliveries.

Cash quotations were as follows: Flour was firm; No. 3 spring wheat, 85@96; No. 2 red, 95@1.00; No. 2 corn, 51½; No. 2 yellow, 52½; No. 2 oats, 41@41½; No. 3 white, 41½@44½; No. 2 rye, 68; good feeding barley, 40@41; fair to choice malting, 48@58.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	32,000	45,100
Wheat, bushels	68,500	23,100
Corn, "	463,400	115,700
Oats, "	545,700	53,400
Rye, "	10,400	7,000
Barley, "	136,600	10,400

DAIRY MARKET.

On the Produce Exchange today the butter market was firm; creamery, 15@25½; dairy, 13½@22; eggs, easier, 27@28; cheese, firm, 10@10⅜.

Dried Fruits, Nuts, Etc.

NEW YORK, Feb. 17.—The market for evaporated apples continues quiet, with the tone rather in buyers' favor; common, 4@6c; prime, 5¼@5¼c; choice, 5½@6c; fancy, 6½@7c: Prunes are firmly held at from 3½@6½c for all grades. Peaches are in fair demand; choice, 7¼@7¾c; extra choice, 7¾@8¼c; fancy, 9@10c. Apricots are in good demand, and with supplies moderate the tone is firm; choice, 9¾@10c; extra choice, 10¼@10¾c; fancy, 12@15c.

CITRUS MARKETS
THE ORANGE MARKET.

The market has been somewhat varied this week as to sales, owing to the extreme weather conditions. For instance, on Tuesday 53 cars of California oranges were sold, of which the Agency sold 45. On Wednesday, says a dispatch to the Los Angeles Times, there was no auction sales of California oranges, because of the cold weather. There was no market from store, shipments being impossible. Railroads are blocked with snow, and the extreme cold prevents deliveries, both here and in the interior. Yesterday 31.114 boxes of Sicily lemons were sold. Prices were: 360s, 1.80@1.30; 300s, 2.65@1.30. The cargo was taken almost entirely by local interests. A few Palermo oranges were offered. Prices were: $1.35@1.20.

Sold to date this season 7140, of which 537 are lemons.

Total to same date last year 5373, of which 665 cars were lemons.

Have you seen Roeding's new catalogue? It's a beauty. Bunch of grapes, Emperors, on the front in natural color, plate of figs on the back—good enough to eat—and a hundred and twelve pages between packed full of half tones and text description of pretty nearly everything which grows in the earth. Besides that, there are directions for planting, pruning, fig culture and a world of other information.

Mr. Roeding has each year gone one notch higher than the last year, but if he ever excels this year's effort he is a good one.

Mechanically it's Kruckeberg's best, and Krucke has done himself—and the book—proud.

DON'T discard your old furniture or piano, just because it has become scratched, and has lost its beauty. It can be made to look as good as new with one application of **SUNSHINE POLISH.** Nothing equal ever produced. 2 oz. bottles, 30c; 4 oz. bottles, 50c. Made and sold only by **SUN MANUFACTURING CO., VENTURA, CAL.** Sent prepaid. Positively guaranteed.

For Sale or Trade

Three hundred and twenty acres near Hemet, 50 acres under cultivation, balance pasture and bee land. Three springs, house, barn, chicken houses, yards, etc.

Ethel G. Smith **Hemet, Cal.**

ALIAS SUMMONS.
No. 42415.

In the Superior Court of the State of California, in and for the County of Los Angeles.
Chas. B. Estill, plaintiff, vs. Mollie Estill, defendant.

Action brought in the Superior Court of the State of California, in and for the County of Los Angeles, and the complaint filed in said County of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Mollie Estill, defendant.

You are hereby directed to appear and answer the complaint in an action above brought against you in the Superior Court of the County of Los Angeles, State of California, this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required the said plaintiff will take judgment for all money or damages demanded in the complaint, as arising upon contract, or he will apply to the court for any other relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the County of Los Angeles, State of California, this 20th day of January, A. D. 1904.

(Seal) C. G. KEYES, Clerk.

200-EGG HENS

And How to Get Them

Buff Orpingtons
Courtesy of Captain Mitchell,
Santa Barbara

You want 200-egg hens? Undoubtedly you do. There is a way to get them. In fact, you can make them out of your own flock of poultry. Why be satisfied with hens that lay only from 50 to 100 eggs per year, when you can have hens to lay 200 eggs per year per hen?

We have learned how to make 200 eggs per year hens and we can make your hens lay that many if you will GET THAT AMBITION and follow these instructions:

1st. Commence with the little chicks. They must be fed on the proper food to FULLY NOURISH THEM so that they can be developed into good layers later on. Therefore it is necessary for their future welfare that these chicks be fed on COULSON'S CHICK FOOD.

Now, of course, it is necessary also that you take good care of pour poultry at all times. Be sure to keep them clean and disinfect their houses with lice killer at least once a week. If you are willing to do this then you are willing to strive for 200 egg hens and we can help you with the SCIENCE OF POULTRY FEEDING.

2nd. The pullets and hens that you wish to develop into good layers and 200 egg hens: feed them a warm mash every morning of COULSON'S EGG FOOD. "No other kind is just as good." NO OTHER KIND is good enough; so if you want 200 egg hens it is necessary that the hens get COULSON'S food for then they get the PROPER FOOD.

At noon, at toward evening, feed the hens Coulson's Scratching Food (which is composed of wheat, corn, hulled oats, etc.) and give the hens plenty of green stuff and plenty of clean fresh drinking water, feed Coulson's food every day and you will develop a strain of 200 EGG HENS.

If your feed dealer hasn't got Coulson's Scratching food, ask him to get it for you. Send for circular describing it.

Many of the largest poultry farms in the county feed Coulson's prepared poultry foods exclusively and purchase it in car load lots.

Situated on the coast in Marin Co., overlooking the Pacific ocean is the 1000 acre ranch of John McDonald, who has, in connection with his dairy ranch, about 2000 hens which are being fed on Coulson's Egg Food. Only a few days ago we shipped him 200 sacks Egg Food and also 50 sacks of Chick Food to feed the thousands of little chicks which he is hatching out.

William Bassett, Tomalis; Geo. Gaston, Two Rock; and A. D. Rezendes, Tomalis; are other large poultry raisers who feed carloads of Coulson's feed.

You can get cheaper foods than Coulson's but they do not contain all the necessary articles and if you want to develop good layers and make the most profit out of poultry, feed Coulson's prepared foods; costs a trifle more than some other kinds but gives GREATEST RETURNS.

When you buy common feed you pay $24 or $25 a ton and it contains about 100 pounds of protein. Now, a ton of Coulson's Egg Food contains about 200 pounds of protein or in other words, there is as much protein (egg and flesh making substance) in ½ ton of Coulson's feed as there is in one ton of common feed. So you are making a great mistake if you don't buy Coulson's feed.

The season is now at hand when the majority of the poultrymen are hatching out chicks by the bushels and a great many are hatched to what sad end?

Have you ever stopped to think how many hundreds, perhaps thousands, of chicks you would have if these fine hatches would not die off so rapidly?

It is to our interest and our business to prepare a feed for little chicks so that the poultrymen can raise the most chicks possible and to have them grow fast and reach maturity quickly and be big, strong, healthy chicks, and we do not only believe, but we know that we have a Chick Feed that fills the bill perfectly and properly.

Only a few days ago we sent 30,000 pounds of this Chick Food to one party. Our Chick Food is used and recognized to be the best by the most thorough and up-to-date poultrymen and the largest poultry farms in California.

For instance, Purvine, Thoergesen, De Rezendes, John Marshall and others out in Two Rock valley, where the largest poultry farms in California are situated. These gentlemen all keep from 3000 to 7000 hens and they have to hatch thousands of chicks every year to keep up such large flocks. They have been in the poultry business for years and have had plenty of experience and tried all kinds of feeds and ways of feeding chicks, and they have now decided that hereafter they will feed Coulson's Chick Food exclusively until they get at least 6 weeks or 2 months old. They have found out that they can raise the most chicks and the nicest chicks on Coulson's Chick Food. These men use tons and tons of our Chick Feed.

Now, perhaps you will say that you are going to try a little millet seed or cracked wheat, rice or oatmeal, etc. But, my dear friend, don't you know that you can feed your chickens on Coulson's Chick Feed and it won't cost you a cent more and that in Coulson's Chick Feed there is a variety of 20 different kinds of grains, seeds, meals and containing everything not only to fully nourish the chicks and make them grow to be big, healthy fellows, but also contains articles that will check and prevent bowel trouble and other fatal diseases.

We are just in receipt of a letter from a poultryman in Windsor who says that he raised 550 chicks on Coulson's Chick Food and at the age of 2 months he sold the broilers for $3 a dozen on the place.

We have White Minorca chicks ourselves that are only 6 weeks old and weigh about 2 pounds apiece.

In conclusion, will say that for your benefit as well as ours we hope that you will raise all your chicks this year by feeding them Coulson's Chick Food.

It your feed dealer hasn't got it, send to us for it.

THE FEED
FOR
Little Chicks

$25 in Gold

We want pictures of chicks and hens that have been fed on Coulson's Poultry Foods and we offer $10 IN GOLD for the best picture of little chicks fed on Coulson's Chick Food.

$5 IN GOLD for the second best picture of little chicks.

$5 IN GOLD for the best picture of hens or poultry that are fed on Coulson's Food.

Season of 1904

LARGE STOCK===COMPLETE ASSORTMENT

Our business has grown to its present immense proportions because we always have sufficient stock to supply all demands, a sufficient assortment to suit all tastes and guarantee everything true to name. This season we have an assortment of fruit and ornamental trees that surpasses anything we have ever grown. Every choice variety is here in abundance.

APPLES Selling rapidly, but we still have a complete line of standard varieties.

PEARS Over forty varieties, including the famous Winter Bartlett. Every tree true to name.

CHERRIES In some sections cherries pay better than any other fruit. The demand this season is greater than ever. Let us figure on the quantity you can use.

PLUMS AND PRUNES Our stock consists of the best varieties known to have commercial value.

PEACHES Growers know that Lovell, Muir, Wheatland, Phillips Cling, Tuscan Cling and McDevitt's Cling all bring good returns. Order now and get the best stock.

APRICOTS If you have the right locality these varieties will pay well: Blenheim, Hemskirke, Royal, Routier's Peach.

WALNUTS A fine stock, either grafted on California black walnut or on their own roots.

GRAPES A larger stock and more varieties than any other nursery. Table, raisin and wine varieties. All the leading resistants. An immense stock of Rupestris St. George.

THE PLANTING OF CITRUS TREES

Some Pointers Secured in an Interview With R. M. Teague, the Largest Citrus Nurseryman, by Which we Mean the Proprietor of the Largest Citrus Nurseries in the World.

The rains which have been so shy this year have somewhat interfered with planting of deciduous trees and to a certain extent with that of citrus trees. The last shower which we had, however, has stimulated trade in orange trees and many busy planters are now grading and putting the final touches on the ground for the future orange grove.

The planting of an orange tree is of enough importance that the utmost care should be used in selecting location, soil, water, preparing the ground and surely in the selection of the trees for the planting. This latter calls not only for judgment in selecting variety which will prove profitable, but in selecting stock which will prove true to name and where handling from the seed to planting time has been such as give stocky, strong growing trees after planting in orchard.

The matter of location has been tested so thoroughly that even a novice may soon secure information by a little observation, which is worth more than anything we can say in these columns. That is, when it is known that oranges grow all the way from San Diego to Shasta, and yet in that vast stretch are many more acres on which the orange will not grow than there are where it will do well, it may be seen that immediate surroundings must be considered. The greatest body of land in which the orange is supreme and successful is from Riverside and Redlands on through the valleys of San Bernardino and Los Angeles counties, within a few miles of the ocean. Then there are sections in San Diego, in Tulare, in Fresno, Sacramento, Orange, Ventura, Santa Barbara and Butte, Sonoma, yes and Shasta counties, where the orange also produces good fruit. The Porterville section of Tulare county has taken no small amount of this year's nursery output.

Mr. Teague told us in a recent interview, that the Porterville, Lindsay, Exeter and Lemon Cove section was taking a large quantity of San Dimas trees this year. The cheaper land and water of that section is proving a strong drawing card.

As to soil and water, the shrewd observer will there also find his eyes of value. Where is the successful grove of today? Adjoining it the conditions must be similar. As a general thing those groves will not be found on the black 'dobe nor where cold and undrained soil is. A warm, loose, underdrained soil is required for best results. And for that soil there must be water—a plenty.

Preparing the ground and planting. That's right in order at this moment, for now is planting time. The San Dimas nurseries have issued a little booklet full of information and from it we quote:

"Preparation of land by deep and thorough cultivation and laying off to secure straight rows by the square, quincunx, and hexagonal methods, should be carefully observed. The orange, in common with other evergreen trees, is exceedingly sensitive to exposure of its roots, and for this reason the handling of the young trees is very different from that of ordinary orchard trees. Exposure of the roots, or careless planting, will consign the tree to a slow, sickly growth, and often kill it outright."

"Planting.—This may be done from February to August, in very warm and sheltered localities. Early planting generally gives the best results. Trees are planted balled or with bare roots, acording to the ideas of the buyer. The tree should be set slightly deeper than it stood in the nursery. Holes should be sufficiently large to admit of the roots being spread out in their natural position. Do not let the earth turn them down in a mass around the tap root. Cut off all broken or bruised roots. Top soil is best for filling in. The soil should be worked in well around the roots and irrigated immediately. Distribution of trees to the holes in advance of actual setting is a pernicious practice, as the roots quickly become dry. Keep them constantly covered with moist packing."

Mr. Teague's little book "The Yea and Nay of Citrus Culture," also has many suggestions in after culture, pruning, fertilizing, etc., which makes it of value to intending planters, especially interesting is the description of varieties.

The San Dimas nurseries handle nearly every thing in citrus stock—the Washington Navel, Thompson Navel, Golden Nugget Navel, Valencia, Ruby Blood, Malta Blood, Kumquat, Tangerine, Satsuma, Sweets, Mikes and so on ad infinitum, with oranges, all kinds of lemons, pomelos and citrons.

For instance, to show the worth of this booklet, we quote from the description of varieties:

"Kumquat or Kin-Kan. — This unique and curious member of the citrus family, commonly called Kumquat in this country, is a native of Japan, where it is known as Kin-Kan, which means gold orange. Kumquat is Chinese for the same meaning. It bears in great profusion a small and very handsome, deep yellow fruit. There are two kinds, alike in tree and differing only in size and shape of the fruit. The Marumi bears a round fruit, from three-quarters of an inch to an inch in diameter; the Nagami, an oblong fruit somewhat larger. The latter is the kind commonly seen in this country, is rather more desirable on account of the large size of its fruits, and is the one we offer. The whole fruit, rind and all, is eaten, and people become very fond of them. The sweet rind and agreeably acid pulp makes a qiquant combination relished by most palates. Preserved in sugar or crystalyzed, the Kumquat wherever it is known, is deservedly popular."

But one of the most important factors in Mr. Teague's nursery work is the uniformly fine stock, free from all pests, and so treated in nursery as to make a fine orchard growth when properly planted.

Thomson's Navel Orange Grove seventeen months from planting. Eureka Lemon Grove seven years from planting.

Reports from the Celery Growers' Association at Santa Ana give the shipments to date for this season as 1177 carloads, of which 341 cars were sent out in January and 201 cars thus far in February. In January the growers received $71,400 for shipments and for December received in excess of that amount. Prices ruled favorably and conditions point to a record return from the year's crop. The recent rains have made a large quantity marketable that would otherwise have been lost.

Dr. Albert Shaw, editor of the Review of Reviews, who has been visiting California recently, started east last Sunday from Riverside. Before leaving he mailed to President Roosevelt some of the leaves of an orange tree which the President had planted in Riverside last May. Dr. Shaw said to the editor of the Riverside Press: "It seems to me that California has greater possibilities of development than any other section of the Union."

ITEMS OF INTEREST.

The Treaty Ratified.—The Panama Canal treaty has been ratified by the Senate. It is a great triumph for the genius of American progress. Its accomplishment is destined to render us supreme in the commerce of the world if we will but build up our merchant marine service. This achievement is the dawning of a new day in our national life.

* * *

As a result of the visit to San Diego last week of John D. Spreckels it is announced the elaborate system undertaken by the Southern California Mountain Water Company, upon which work has been suspended two years, will be completed. The enterprise contemplates the storage of water at Morena dam and bringing it to that city for domestic and manufacturing purposes.

* * *

The Anti-Docking Bill.—A bill for the prevention of cruelty to horses by "nicking" or "docking" their tails has been introduced in Congress. It certainly should meet with favor in both houses. This humane measure has been put through at the instance of the humane societies of the larger cities throughout the Union. The bill should have the support of every right-thinking man in Congress. The nicking and docking of horses to make them appear "smart" is a barbarous practice. It is less excusable and more brutal than the cruel branding iron of horsemen on the plains of the frontier. The measure should be made as drastic as the law defining and punishing mayhem, for that is just what it is. It had its origin in the cropping of the tails of army horses, as a provision against mud. It became a fad among the English gentry, who would ape the military in everything they could. Like all fashions it was carried to extremes. The shorter the horse's tail was cut the "smarter" it appeared, until it became a common saying on the continent that "nobody but an Englishman can surpass the Almighty in making a horse." When our British brother chopped off his horse's tail clean to the quick and dubbed him a "cob," he did a smart thing but did not improve the appearance of the horse. When President Roosevelt wanted a pair of carriage horses he expressly stipulated that no bobtails need apply. He wanted a team in its entirety, and he was right. The anti-docking bill should pass.

* * *

Apathy of Prune Men.—The Fresno Republican calls attention to the Oregon prune market and the efforts being put forward to create some activity there in the following strong terms:

"Up in Washington the prune men are up against a state of affairs which is not unlike that which besets the raisin growers of Fresno. But there something is being done to start a market in marked contrast to the bump-on-the-log policy which is being followed here."

The conditions surrounding the Oregon market, it appears, are very depressing, and up to this time nothing is in sight to awaken activity. Not content to allow the existing conditions to obtain longer, the Oregon prune growers have devised a scheme to rush the market, so to speak. They have arranged to send a competent salesman into the Middle West cities and towns and arrange for a house to house canvass for the sale of fruit in 25-pound boxes. The price fixed is 10c per pound delivered, making the cost of a box of prunes $2.50. The plan includes the payment of 50c per box to the agents. Believing that a 25-pound box, selling for $2.50 is too large to find ready sale in cities, the association is planning to procure pasteboard boxes, holding from 2½ to 10 pounds, to be used in putting prunes upon the market in popular-sized packages. All of which is merely objective to the point that the Fresno prune growers may profit by the energy displayed by the Oregon prune growers in pushing their product upon the people.

* * *

Lemon Growers Losing Money.—T. J. Ashby, manager of the Pasadena Lemon Growers' Association, complains that the lemon growers are not making the money that they should. Discussing the cause of this condition he ascribes it to several reasons, but the most serious one is the market. As the figures run, for the past three years, the last five months of the year, the growers have only received 45 cents per box. "This means," says Mr. Ashby, "an average sale in the eastern market of $2.10 for a box containing 25 to 30 dozen lemons, weighing 85 pounds." Which means, we suppose, a loss to the raiser of from 20 to 30 cents per box. The remedy Mr. Ashby thinks lays in the methods adopted by the grower. First, by the best horticultural methods, the grower can raise more fancy fruit and less culls than he now does. By intelligent pruning and use of water he can raise more fruit for summer trade than is now done, and by more careful methods of picking, delivering and storing he can have less loss by decay." As to a market, a better one can rarely be found, this gentleman says, and he cites the fact that Hongkong is now caring for a great deal of the lemon product of California. Australia, too, consumes our lemons, and San Francisco is thirty days from Australia, and the cost of placing large, well packed shipments of lemons in Melbourne, including local freight, ocean freight, packing, tariff and commission, is $2.50 a box as against the $1.65, freight, packing and selling charges to an eastern town. It is summer in Australia, and summer prices rule during the months when our winter prices rule. Their average price is about 25 shillings ($6) per box during the time our average price is $2.10."

It seems from Mr. Ashby's investigation that few lemons are grown in Australia. They import from Italy and it takes six weeks against our thirty days to get them through via Suez. "The facts, says Ashby, " are in favor of carefully selected fruit being packed and shipped under one brand to our Australian friends, and it shows a strange apathy or the difficulty of changing trade methods that it is not being done by our large organizations.

CITRUS MARKETING.

A short time ago the citrus fruit growers of Tulare county appointed a committee to investigate the methods employed by the Southern California Fruit Agency in marketing the orange crop of the past season, dissatisfaction with the prices received from which, was the cause of this action. A committee was appointed to visit the Agency headquarters and interview the management as to why better prices have not been received by the members for the fruit handled by the Agency during the season last past. The committee, as we understand, did not go to Los Angeles, but instead the members of the Porterville Citrus Association met a few days since at Porterville, and after a full discussion of the situation adopted the following resolutions:

Whereas, we, the growers of Porterville Citrus Association fully believe in the principles of co-operative marketing as exemplified by the Southern California Fruit Exchange, and have been fully satisfied with the results of its methods prior to the organization of the California Fruit Agency, and

Whereas, the Exchange is an organization of growers, having the best interests of the producer at heart, marketing fruit at cost and returning to the grower the net proceeds; while the California Citrus Union is an organization of packers and shippers, and may rightly be regarded as speculative in its methods: and

Whereas, these are heterogeneous elements which cannot be successfully harmonized, which conclusion is substantiated by the experience of the past season; and

Whereas, by the formation of the California Fruit Agency the Southern California Fruit Exchange has limitations of membership imposed upon it that are not for the best interests of the grower;

Therefore, be it resolved, 1st, that hereafter it shall be the purpose of this Association to do all within its power to maintain the Southern California Fruit Exchange intact, and to assist it in returning to its old policy of independence;

2nd, that to facilitate this action we open the doors of our Association to all growers whether members of the California Citrus Union or otherwise, desiring membership;

3rd, that we urge all other associations to unite with us in requesting the Tulare County Citrus Fruit Exchange to invite the formation of new associations of growers at any place where present packing facilities are insufficient for handling the crop in an expeditious manner;

4th, that should the Southern California Fruit Exchange continue in its present alliance with the California Citrus Union, and should there be no similar organization of citrus growers formed to which we could unite, that we favor an independent organization of the growers of Tulare County; and

5th, that we furnish to our sister associations reports of our action in this meeting, and thus hasten the realization of its purpose."

With all the inside facts which have led up to this action on the part of the Porterville Citrus Association, this paper is not advised. There may be just cause for the dissatisfaction which exists, but on the general principle of co-operative marketing there can surely be no direct dissatisfaction.

The varied experiences of independent associations formed to take the place of the Exchange, in the past, have led to but one conclusion, and that is this: that of all the agencies employed to market the fruit crops of California the Southern California Fruit Exchange was most conducive of results. It brought order out of chaos and made profitable, to an extent, the orange growing business which before the existence of the Exchange was not remunerative to the growers of citrus fruits.

The Southern California Fruit Agency is the child of the Fruit Exchange and the California Citrus Union, but its life has been too brief to be able to say definitely to what extent its efforts shall be conducive to the prosperity of the orange growers in California.

We are glad to note, however, in the resolutions adopted by the Porterville Citrus Association, that the members are not against the Exchange or the co-operative idea, but merely question the advisability of longer remaining connected with the Citrus Agency made up as it is of the Exchange and Citrus Union.

Under his department Mr. Jeffrey discusses, at length, the Agency side of this question, which is one of the paramount subjects before the fruit growers of this State at this time.

BY J. W. JEFFREY, LOS ANGELES

WISE COUNSEL NECESSARY.

There is a disposition among some of the growers in the northern citrus belt to hold the California Fruit Agency responsible for the low prices received for citrus fruits the present season. While criticizing the work of the Agency these growers unanimously re-affirm their adherence to the co-operative system of marketing, and believe in fostering an enterprise that has the best interests of the orchardist as its governing policy. The growers of the north claim that there are heterogenous elements combined in the Agency that cannot be successfully harmonized, and point to the experience of the past few months in substantiation of this claim. Another claim is that the Southern California Fruit Exchange has placed limitations upon its membership that are not to the best interests of the grower. The disposition to hold the marketing agency responsible is natural, but experience may prove that there are other things to reckon with entirely foreign to any system of marketing that could be organized.

Those firm northern believers in co-operation are forced to consider the fact that the organization they now commend, namely the Southern California Fruit Exchange, was unable, after ten years of the most strenuous efforts ever put forth in the name of agricultural co-operation, to gain a constituency of more than half the citrus fruit growers of the State; that because of this fact the Exchange was utterly unable to hold the markets steady for the whole, while 50 per cent of the growers were selling independent of the co-operators; that a resultant condition confronted the entire industry last spring as bad as the imagination can conceive; that if the principles to which the Porterville growers now make new allegiance are good business principles they are good for the whole industry, and unless they are acceptable to practically all the growers other circumstances have play that neutralize the application of those principles. These growers must also remember that experience has shown that the citrus business cannot survive the competition between the different lots of fruit when offered through a multitude of sources, each irresponsible to the other and the grower entirely out of control: that the counsel of thousands of citrus growers is better than the resolutions of a few, for there is a controlling degree of interdependence upon each other and upon proper distribution resulting from co-operative policy that is as necessary to the sale of fruit as is its production; that no change in the present arrangement should be contemplated that does not insure a central control, without which experience has shown that utmost disaster has befallen the industry when its products were not 20 per cent of the present output. If these things are true we are inviting disaster in advocating independent action or again attempting to market the great quantities of fruit without a plan recognizing the dependence of each section upon the other.

Those who are expecting the ideal in co-operative marketing have forgotten to reckon with the human nature displayed in all previous attempts to unite the growers in general upon a co-operative system. There was a great deal of it extant up to the time of the formation of the Agency, and there is more of it coming. With this in view the growers are forced as a whole to compromise upon a plan as near ideal as possible. If the members of the Citrus Union are charged with "adhering to speculative methods" under the Agency plan, the answer is that one-half the growers approved of those methods up to the time of the Union's advent into the otherwise co-operative whole. But is the plan of the Citrus Union speculative? Its members agree to pack, and sell the fruit through the agency which they help to sustain, at a flat rate per box. Formerly they bought in lump quantities, or by the pound or by the box—all purely speculative and forming a leverage by which to break down prices and yet make high profits on their investments. One firm a few years ago paid a crop estimator a large salary just to place the firm in a position to drive sharp bargains with the growers. All this has disappeared, and now the Union members have been limited to legitimate profits arising from packing and selling the fruit of their old customers. Some of the associations of the Exchange have paid for packing services in this way for years. "The independent policy of the Exchange" is a pretty phrase, but it cannot be used by those who remember the conditions of last March. Nothing can be independent which is bound hand and foot by circumstances. That was the condition of the whole field last March, and it will prevail again unless a plan is devised to include all and that is better than the Agency.

CITRUS FRUITS

BY J. W. MILLS, ONTARIO, CAL.

PINE NEEDLES AND ORANGE TREES.

Editor Cultivator:—Will you please answer through the Cultivator if you think that pine needles injure the soil, or do they have any effect on orange trees growing near to them? I have been told by different parties that the needles poison the soil. My observation has been that the roots of the pine needles did more damage than the needles. I do not think that the needles do much good on light sandy soil, but do not think that they do any harm, though on heavy soil I think that they are a benefit. I noticed that where I dug down four feet and about four feet from the pine trees and cut off the roots the orange trees were much benefited.—Subscriber, Lordsburg.

You are undoubtedly right about the bad effect of pine trees growing next to orange trees. Pine needles have gained the reputation of being poisonous to the soil from the fact that seeds do not grow where they are very thick on the ground. There are two reasons for that. When enough needles fall to cover the ground, the trees are so large that they shade the ground when nothing but perennial roots that require shade will thrive there. The fact that the needles form a mat would also prevent seeds from gaining a hold on the ground. The same conditions exist in all evergreen forests or under large isolated trees. For instance, under the live oak nothing will grow when the fallen leaves form a covering to the soil. Isolated trees whose branches come close to the ground have no grasses or annual plants growing beneath them. Still, when the trees are cut down, the soil there is exceedingly rich. If your pine trees did not have the power to send their roots out into the orchard and rob the orange trees, the pines could not live. Cutting off the roots as you describe will be as effective in retarding the evil influence of the pine trees as it would that of other trees used as a windbreak.

To Kill Red Scale.

By C. A. Day.

I have received from a fruit grower of Riverside a letter in which are asked a number of questions relating to the control of red scale. As these questions are of general interest to citrus fruit growers, I take the liberty to answer them through the columns of the Cultivator. The questions are as follows: "Has distillate emulsion used in your district during the past season been successful in destroying the red scale?"

"In speaking of red scale, what has been your experience with the pest? Is it increasing in your district?"

"Can every particle of red scale on a tree be effectually destroyed? If this is the case, why is it that the campaign in Los Angeles county goes on with ever increasing energy?"

The distillate emulsion and the distillate mechanical mixture have both been used in my district; their work on red scale is not satisfactory, and the continued use of these sprays or any other sprays for that matter will not prevent the scale from increasing and infecting adjoining orchards.

To annually spray an orchard slightly infected with red scale will result in the scale increasing from year to year, and the orchard will become a source of infection for the surrounding orchards.

The red scale breeds throughout the year when the weather is warm enough, but in the winter season the period of its development is much longer than in the warm weather of the summer. The principal breeding season is from the last of May to late in the fall and during this season the young scale arrives at maturity in from 30 to 40 days. The female scale produces about 200 young. From this it will be seen that the increase from a single scale for the summer would be many thousands. Spraying has been a failure because it does not in a single instance clean a tree and always leaves a good stock of scale with which to begin the principal breeding season, and during a part of which there is no treatment applied to hold the red scale in check. The habit of the red scale is to establish itself on the trunk, limbs, twigs, leaves, and fruit of the tree, and for this reason, though the spray may be strong enough to kill the scale when it strikes them right, it does not reach and destroy all of the scale.

Two per cent distillate mechanical mixture as applied in a number of instances that came under my observation left a very large amount of live scale. There are no eggs and any treatment that will destroy the old scale will make clean work. It is possible to destroy every living red scale on a single tree by means of a single fumigation, but in experience we find it difficult to destroy every live red scale on an orchard of any extent. The failure in this case is due to carelessness or incompetency on the part of the fumigators.

In fumigation for red scale the trees should be in condition to stand the required dose, the tents should be whole and practically gas tight, and remain on trees for a full hour. The proper density of gas should be maintained for the entire time. This can only be secured by using a sufficient quantity of cyanide and using water in proportion of 3 or 4 to 1. Measurement of tents will aid in securing perfect work in this estimating of the dose.

Where there are only a few infected trees in an orchard, it is advisable to inspect the whole orchard and mark the infected trees and fumigate at once; but this method will not exterminate the scale for the reason that the best inspector in the world could not find every live red scale in an orchard because of their habit of locating on every part of the wood, foliage and fruit of the tree, and because the young scale are very small. When the scale becomes generally scattered over the orchard, the whole orchard should be fumigated. After fumigation a close watch should be kept, especially through the summer season, for the appearance of red scale. Careful inspection of the whole orchard should be made and infected trees fumigated. If an infected tree had a considerable number of matured scale that are breeding, it would be a good plan to fumigate the adjoining trees in order to catch the young scale that are moving. The scale at this stage is very small and soon locates and remains immovable during its life time.

The sections of Los Angeles county where the red scale is under the best control is where fumigation for black scale has been general and constant. This is the case especially from the San Gabriel river east to the county line, where the scale is practically exterminated. We find the red scale increasing where fumigation has ceased. With the destruction of the black scale by parasites and the consequent discontinuance of fumigation, we may expect in the future an increase of red scale, with the probability, if spraying is continued, that it will come to infect every orchard in districts where it has or may gain a foothold.

Farming with Brains.

Every farmer should know how to use fertilizers. The proper way is described in our

Books on Fertilizers, Sent Free on Application

A fertilizer containing six per cent. of

Potash

is necessary for Wheat, Oats, Corn, Rye and Grass.

The Apple Growers' Monthly Meeting.

The monthly meeting of the Los Angeles County Apple Growers, held in the horticultural commissioners' rooms on Saturday, was quite generally attended and of more than usual interest. Although no program had been prepared, the session developed discussion along lines which are of special concern to apple growers in this section.

At a previous meeting a resolution had been adopted endorsing the action of the Board of Health of Los Angeles in relation to the sale of wormy or scaly apples, and also endorsing the method employed by R. E. Drummond in carrying out the order of the Board of Health.

The action of the apple growers in endorsing these officers created quite a range of discussion, part of the members favoring, others criticizing the endorsement. Some held that the resolution should be rescinded, as it is thought a special hardship is worked upon the small apple growers by reason of the fact that apples from outside the county find a ready market which are not better than the culls thrown out by the health officers, and also from the fact that the method of inspection is so sharp as to make it difficult for orchardists to conform to the requirements of the rules laid down by the health board and have any apples to market.

Mr. Ward, president of the association, read a notice, sent to all apple growers—a part of which is here quoted:

"It is unlawful to sell or keep for sale in the city of Los Angeles any fruit or vegetables that are infected with scale or other insects, whether larvae or pupae, or that are in any manner affected so as to be unwholesome or unfit for food."

This notice was signed by L. M. Powers, health officer, and R. E. Drummond, inspector.

It was on the action taken at a previous meeting endorsing Mr. Powers and Mr. Drummond, and their summary dealing with all infected apples, that the criticism came at Saturday's meeting.

Mr. Ward thought that the same action applied to the vegetable and cereal markets would cut out nearly all, or at least a large per cent of the vegetables sent to market as well as corn, hay and the cereals. The act of the health board he deemed too sweeping, and he was positive that erroneous conclusions would be reached by the impressions which the resolution of endorsement carried with it. He did not think culled apples should be eliminated from the market. He strongly favored cutting out infected or bad apples, but culled apples are not always infected nor bad.

Mr. Squires supported the views of Mr. Ward, and contended that wormy apples are not of necessity unhealthy and should not be thrown out by the inspector. Mr. Jeffery came to the support of the board of health and the inspector and made a strong argument in favor of keeping the standard of fruit to a high order. He said the Board of Health cannot and will not condemn fruit unless evidences of infection are present. He thought it quite likely individuals would object to the action of the board, but it was a matter which would, in time, benefit the grower. "The board," said Mr. Jeffery, "is not strict enough. The resolution instead of being rescinded, should be made stronger." "The orange growers have been compelled to throw out the culls," said he, "and why should apples which are infected be allowed to sell any more than infected oranges." In closing his talk Mr. Jeffery asked "Which will lead to the greater loss, foreign fruit which is not infected, or culls in general use with attending lower prices?"

Mr. Ward answered Jeffery at length and said, "It is not necessary to legislate against apples for each individual buys his apples on their merit; oranges they do not buy as they do apples, for they don't know so much about them." Messrs. Harper and Squires were of this opinion. Harper feared the restrictions of the Board of Health might become so severe as to injure the apple trade. Squires did not think the apple growers of Los Angeles county would be benefited sufficiently to justify the quarantining of northern apples because they are culls. Along this line, pro and con, the argument ran, but without any formal action rescinding the resolution which was the cause of the debate.

Mr. Maskew urged incorporation as a means of counteracting any unjust legislation against the apple growers of Los Angeles county. Mr. Hunt supported this view as did some others, but the concensus of opinion seemed to be that the time is not yet ready for such action.

Mr. Searles desired information as to spraying his trees for San Jose scale, and Mr. Maskew replied favoring spraying, and said it will kill the small scale and the large ones not killed will leave the trees. Mr. Ward said his experience with the ladybird is that it is a thorough cleaner of San Jose scale.

At the next meeting a program of papers is to be prepared and topics of interest discussed. As a whole the meeting of last Saturday was interesting and instructive.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

THE NORTHERN PEAR BLIGHT.

A very uneasy feeling has been prevalent among the pear growers in Sacramento and Placer counties, for fear that the malignant pear blight, which has wrought such havoc in the upper San Joaquin valley, had got a foothold in the orchards of those sections. From a very thorough inspection lately made, it appears that such is not the case, and while there are many cases of pear blight in which many twigs and some of the larger limbs of the trees die back from some unknown cause—and this form of blight has been very serious for several years past—the malignant form of the pear blight, as it has shown itself in the southern counties of the San Joaquin, does not appear to have obtained a foothold. The blight in the Sacramento region attacks old trees principally, and those which have been weakened by many years of severe pruning. The severe cutting back year after year which prevails here seems to have lessened the vitality of the trees until they are ready to fall easy victims to any disease that is around. Young trees, although in full bearing in the same vicinity, do not seem to be attacked. In these respects the disease does not resemble that which has caused such devastation in other parts of the State. There the most vigorous trees are the first to succumb. The better cared for and the more thrifty the tree, the more liable it is to attack, while those trees which have been most neglected and have made but a stunted growth withstand best the attacks of the blight baccili. With the malignant pear blight the point of attack is, in the great majority of cases, through the blossoms, and we have seen orchards in which every blossoming tree was attacked and ruined, while not a young tree showed a symptom of the disease and were growing as thriftily as though there were no such disease in existence. In the case of the northern pear orchards it is safe to state that the malignant form of the blight has not yet appeared among them and that the disease which is now affecting them, much as it is to be feared, is not nearly so bad as that which has prevailed in the San Joaquin valley pear districts. Remedies in these cases are hard to recommend. The disease is an insidious one. It works wholly in the sapwood of the trees and does not make its appearance until the damage is done, for when the pear blight makes itself visible that part of the tree on which it shows itself is beyond redemption. Then, too, as it works wholly below the surface and in the sap wood of the tree, there are no sprays or other surface treatment that will reach it. The only thing to be done when a tree shows signs of being attacked by blight is to cut out the affected parts, well below the point of infection, and burn the prunings at once. This may, in the case of an otherwise healthy tree, be the means of saving it, in other cases it may prolong the life of the tree and enable the owner to get several crops before the final end, which in the case of old, worn out and unresisting trees, is almost inevitable.

* * *

CHEAP NURSERY STOCK THE DEAREST.

The most expensive way of saving money is in buying cheap nursery stock for planting, and yet it is often done by people who pay dearly for it afterwards. The purchase price of a tree is by far the least part of its cost; the expense lies in its planting and care to bearing age, and if then the planter finds that he has got an inferior tree, or one not true to name, he may have to throw away not alone the first cost, but also the added care of it up to that time, the interest on his money, and worst of all have lost the precious years that will elapse before he can get fresh stock into bearing condition. Cheap trees are the poorest form of economy. In setting out new orchards get only the best, both of stock and varieties, it does not matter if the first cost is a few cents more per tree, good thrifty stock is worth the added price, and as it represents additional care and labor on the part of the nurseryman, he is entitled to the extra price. Purchase your stock, too, of established firms, people who are responsible for the stock sold and whose representations are good, or who can be held to account if they should prove otherwise. Responsible, well established nurserymen, who have a business reputation which it has taken years to build up, at stake, cannot afford to deceive the buyer; it would not pay them. The reverse is true of the traveling representative of some unknown firm. His whole object is to make a sale and he can offer any inducements to get contracts. He is never out of any variety the purchaser may want, and can fill a bill for a dozen varieties from the same lot. It makes no difference to him for he knows that when the trees get into bearing and the purchaser finds out the cheat, he will be far out of reach. Now to summarize: Purchase only the best stock procurable, be sure of the varieties, and be sure to buy from some well known and well established nursery.

* * *

CORPORATE VANDALISM.

I do not know of any greater set of vandals than the telegraph and telephone linemen, at least those in the upper part of the State. They seem to work under the impression that, being in the employ of strong corporations, gives them the right to enter upon and destroy property belonging to private individuals without as much as "By your leave." Shade trees aligning the streets and roads are ruthlessly destroyed by these people, if they in any way interfere with the unsightly wires they wish to string. Limbs are chopped off from one side, leaving the tree out of balance. Frequently large limbs are cut off several feet from the trunk, leaving a bare stump which must ultimately decay and rot. and always damaging the tree so treated. Offences of this kind are committed by these corporations and their employes that neither, as private citizens, would ever dream of, but in their corporate capacity they seem to have the idea that they are greater than the people and have every right to do as they will with public property, to mutilate or destroy it, if it happens to be in the way of their lines. In many cases the trees so mutilated or destroyed represent years of care and labor. They are maintained at the expense of the property owner for the public benefit and to beautify the driveways along which they are planted, and while, perhaps, private interests in such cases must give way to public necessities, means could be found, with the consent of the owners, to trim up the shade trees in such a manner that the one could be accomplished without injury to the other. As it is now tree butchers seem to be chosen for the work whose aim would seem to be to do the work in the worst possible shape and with the greatest amount of injury to the trees.

* * *

MONEY IN WALNUTS.

There is one class of fruit growers from whom there appears to be no complaint of over-production or of under-demand, and they are the walnut growers. At the late fruit growers' convention, Mr. Kellogg, president of the Walnut Growers' Association, made the statement that all the growers were doing well and that the past season had been a very prosperous one for them. This, coming at a time when the prune men, the raisin men, the wine growers, and the dried and fresh fruit men, were unanimously complaining of their various difficulties in disposing of their crops, was very refreshing. It is unquestioned that walnuts are now paying as well or better than any other fruit product, and, except for the walnut blight, which is threatening the industry to some extent, there are few evils to be apprehended by the walnut growers. This fact is being realized largely in the northern counties and very much interest is being evinced in walnut growing in those sections which are at all adapted to it. The walnut will, undoubtedly, do well in Santa Cruz, San Mateo, Sonoma, Mendocino, and other of the northern coast counties, where proper conditions prevail. These conditions are a comparatively even temperature, not too hot, for hot weather is fatal to the best results of the walnut—a deep alluvial or warm sandy soil, well drained. These conditions can be found over a large area in the northern counties, and from present appearances they are likely to be taken advantage of by those who possess them.

NURSERY

W. HERBERT SAMSON, PROP.

We have for sale all leading varieties of Deciduous Fruit Trees

OUR SPECIALTY:

Lob Ingir or Genuine Smyrna Fig of Commerce

A WORD ABOUT FIGS: We sell the genuine Fig of Commerce. Our cuttings came from bearing trees in the orchard of the Stanford estate, near Vina, and the fruit from these trees, after being examined by the best fig experts of the State, is pronounced the genuine Fig of Commerce, the Lob Ingir. Dr. Eisen says this and no other variety should be known as Smyrna, if the name Smyrna is to be used at all. We can refer prospective purchasers to the Supt. of the Stanford ranch, at Vina, for a verification of this statement. As to my own reliability, I can refer parties to any of the leading merchants of Corning, and to the Bank of Tehama County, and the Herbert Kraft Co. Bank, at Red Bluff, Cal. No one in the Unites States originated the Commercial Smyrna Fig. It is a variety which has been grown in Asia Minor for thousands of years. Parties may originate a fancy name and copyright it, but this does not make the fig they sell under a copyrighted name, any better. The fig we sell does not require a high sounding name to make it appear as the only commercial fig. All that we claim for our fig is that it is known as the Lob Ingir, the cuttings of which came originally from the famous orchards of Smyrna, Asia Minor, and is of the variety so largely imported into the United States in the dried state. We are not charging you for a private copyrighted name, but we sell you good 2 to 4 foot trees of the Genuine Smyrna Fig of Commerce at $150 per M. To fully demonstrate the methods used by some nurserymen in giving old varieties of fruit trees a new name and thereby make it appear that they have the only genuine article, we will say, how ridiculous it would be if we copyrighted a name like "Muro" and sold the old variety of Muir Peach under this name. Do not be misled by copyrighted names. We have the genuine Smyrna Fig of Commerce and if you want to confirm our statement, we do not hesitate to refer you to the above named parties. We can supply prospective planters a small sample of our dried figs for comparison with the so-called copyrighted figs. We also have for sale all varieties of Capri Fig trees, and all of our customers will be supplied at the proper time with a colony of Fig Wasps, free of cost. Address

BY J. W. MILLS, ONTARIO, CAL.

PEACH MOTH AND ALFALFA.

Editor Cultivator:—The peach worm troubled my young peach trees terribly last year. What and how can I prevent it this year?

How can I best prepare a field for alfalfa seed? Some advocate deep plowing before the winter rains and shallow plowing just before sowing.

Do you advocate deep or shallow cultivation? Which retains moisture best?—Subscriber, Healdsburg.

The peach worm, the fellow that bores into the fruit during the summer, is best combated by spraying with lime, salt and sulphur just as the first blossoms open. This has been proven by experiments on a large scale and is now generally practiced by peach growers who are expecting trouble from this worm. The spray is made by boiling in about twenty or thirty gallons of water, 20 pounds of freshly slacked lime and 20 pounds of sublimed sulphur. The mixture should be boiled briskly for an hour and a half, then add 20 pounds of freshly slacked lime and 15 pounds of stock salt and boil for another half hour. Make the whole amount to sixty (60) gallons and spray while warm. It is important to get a heavy coating of the spray in all the cracks and crotches of the trees as there is where the worms come out in the greatest numbers.

It is a good plan to plow ground deeply before the winter rains come when contemplating planting alfalfa. On soil that does not pack and run together, cultivating about five inches deep will answer as well as plowing. The soil should be well firmed with a light roller before planting and if the seed is sown broadcast, the harrow should have the treeth slanted back so that the frame will press the soil down slightly. The point to keep in mind is that seed must have a firm bed so that the moisture will not pass off before germination takes place. If the soil is too loose, the air will pass through it too rapidly and dry out, and at the same time capillary action cannot take place rapidly enough to keep up the supply from below. The soil containing the seed must be kept close to the solid bed below in order to keep up the circulation of moisture from below. If the soil is so packed that circulation takes place very rapidly, there is danger of the ground drying out before the young plants are old enough to irrigate. On moist land there is not this element to contend with except where alkali is present in quantities.

Deep cultivation is better than shallow for retaining moisture. By shallow cultivation we mean three or four inches deep and by deep we mean five to six inches. Cultivation six inches deep is seldom done and it takes an especially made cultivator and a good team to do it. There are some orchardists who have shown splendid results by cultivating instead of plowing.

* * *

FRUITS FOR IMPERIAL.

Editor Cultivator:—Would you recommend raising varieties of grapes here which have tender skins, such as Feher Szagos and Emperor. How would the Smyrna fig, Sevillano olive and the Jordan almond do here.—Francis Heing, Imperial, Calif.

There is no possible way of telling how any of the fruits that you speak of will do at Imperial until an actual trial has been made. Pioneering is not all plain sailing and experimentation must always follow it before any definite knowledge may be gained in any kind of work, and especially in horticulture. The climatic conditions and the soil both vary in all sections and when it comes to dealing with the extremes of climate (you have one of them) the results are sure to be problematical. The comparatively old settlement of Coachella has similar conditions of climate but they are still at sea on the points you raise, simply because they have never tried those varieties.

Editor Cultivator:—How should American or "Eastern" grapes, such as Worden Agawam, etc., be pruned to secure the best results.—Subscriber.

Those grapes should be trained on a trellis to secure the best results. You will get a fair crop by pruning them short, and this is sometimes done. If the vines are not so situated as to be conveniently trained over a trellis, tie them up to a stake so that the vines resemble a heart in outline, the ends being tied so as to point down and all tied in a bunch to the stake, will be the proper manner.

* * *

DWARF FRUIT TREES FOR GARDEN.

Will you kindly inform me as to the advisability of planting dwarf fruit trees in the garden, as apples, peaches, pears, apricots, etc. Also where I can obtain such nursery stock of varieties best adapted to local conditions.—G. B., Upland.

Apples and pears are successfully grown on dwarf stocks, but we do not know of peaches and apricots being grown as dwarfs.

Dwarfs are desirable for a garden and bring fruit the second year from planting. Apples are dwarfed on Paradise and Ducine stock and we prefer the latter. Paradise roots are very susceptible to wooly aphis and the trees are very much dwarfed. Ducine makes a little larger tree. All kinds of apples do well on these as far as we know. Pears are dwarfed on quince, but there are but a limited number that seem to thrive as dwarfs. Among these are Duchess D'Angouleme, Easter Beurre, Winter Nellis, Colonel Wilder and Patrick Barry.

Standard trees do well trained against a wall or the side of a building. We prefer large growing trees where there is wall space enough to accommodate them. They may be trained flat against the wall and thus occupy very little space, where they will produce a large amount of fruit. We would place them on the north or east sides in preference to south or west for the reason that the reflection of heat from the sides during the hottest time of the day might burn the trees or fruit.

Dwarf trees may be furnished by any of the large nurserymen who advertise in the Cultivator.

* * *

SEEDLING PEACHES.

Editor Cultivator:—Is the Sabeach peach a seedling? Do we understand that a seedling peach is one that will come true to the seed every time?

When is the best time to transplant Lauristinus and Strawberry guavas?—E. L. P., Azusa.

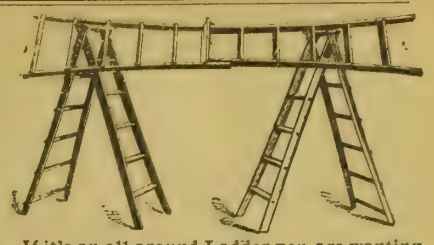
All new varieties of peaches or any kind of fruit are seedlings except in rare cases, where bud variation will make something quite different from what will grow on the balance of the tree. Some very valuable new varieties have been brought out from this source, but perhaps more than 99 per cent of our varieties are from seedlings. We do not know the history of the Sabeach peach, but we would be willing to bet a turnip against a leg of mutton that it is a seedling.

END OF THE OLIVE SEASON.

With the closing of the season the olive men report a marked improvement in the industry as a whole in Southern California, but they say that the small grower of olives has no show to make a profit on his crop. This has been complained of by several local ranchers and many olive trees are being cut down because the growers are dissatisfied with the revenue.

The cutting down of the olive trees is discouraged however, by the oil mill men, as they say the demand for olive oil is growing on the market, and it will be but a comparatively short time until all the output of the groves will be utilized by the mills. The olive oil industry as now conducted in the country is quite general. Besides the large growers who manufacture their own product there are between 150 and 200 growers in Southern California who produce one ton or more olives annually. Out of this number there are a few who operate small hand presses, which turn out thirty or forty gallons of oil each. One ton of olives will make about thirty gallons of oil. In the northern part of the State the same conditions obtain, in some counties, to a greater extent than in Southern California.

Some sections of Washington are coming into prominence as bean producers. The popular varieties are White Navy, Brown Mexican and Lima. The yield is 50 to 75 bushels to the acre.



If it's an all around Ladder you are wanting our "ACME EXTENSION" can't be beat. A double Step Ladder and a Straight Ladder combined. Built of best spruce lumber, every step bolted and riveted throughout, with new automatic lock. Circular free.

HANNA BARLEY
SPELTZ
MAC WHEAT
OATS
BROMUS
ALFALFA &c.
SALZER'S SEED NOVELTIES
SALZER'S NATIONAL OATS.
Yea, farmers of America, lend me your ears, while I chant the merits of this new Oat Novelty.
Editors, Agricultural Writers, Institute Orators, all talk and write about this new Oat. It yielded in Wis 156 bu., in Ohio 187 bu., in Mich. 231 bu., in Mo. 255 bu. and in N. D. 310 bu. per acre, during 1903, and in 1904 you can grow just as easily 300 bu. per acre of Salzer's National Oats, as we can. Your land is just as good, just as rich and you are just as good a farmer as we are. We hope you will try this Oat in 1904, and then sell same for seed to your neighbors at a fancy price, next fall.
Macaroni Wheat.
It does well on arid, dry lands, as also on rich farm lands, yielding from 30 to 80 bu. per acre.
Speltz and Hanna Barley.
Greatest cereal food on earth. Yields 4 tons elegant straw hay and 80 bu. of grain, as rich as corn, oats and wheat ground together! Does well everywhere. Hanna Barley grows on dry, arid lands, yielding 60 bu. per acre.
Salzer's Home Builder Corn.
Positively the biggest eared early corn on earth, yielding in Ind. 157 bu., Ohio 160 bu., Tenn. 198 bu., Mich 220 bu. and S. D. 276 bu. per acre. It is really a marvelous corn. Sinks its roots deeply after moisture and nourishment and grows like a weed.
Bromus Inermis and Alfalfa Clover.
Bromus Inermis is the most prolific grass for permanent pastures on earth. Yields 7 tons hay per acre. Good on sand, lime, clay, gravel—yes, on all kinds of soils.
Alfalfa Clover produces more hay and better hay than any Clover known. It is good for 7 tons per acre.
Potatoes 736 bushels per Acre.
The Editor of the RURAL NEW YORKER says, "Salzer's Earliest Potato is the earliest out of 58 early sorts tried, and yields 464 bu. per acre, while Salzer's Early Wisconsin yielded for them 736 bu. per acre. Salzer's Potatoes for yield challenge the world."
FOR 10c IN STAMPS
and the name of this paper, we will send you a lot of farm seed samples, including some of above, together with our mammoth 140 page illustrated catalog. Send to-day.
JOHN A. SALZER SEED CO. LaCROSSE, WIS.

Conducted by PROF. A. J. COOK, Claremont, Cal

TEXAS FEVER.

A. W. Posey, Palms, who wrote of the Texas fever, some months ago, writes wishing more information. He says it has just come to their region, and he wisely urges that they stamp it out in its inception. He also says, what is very true, that it is an incurable disease. The mortality is very great when the disease takes it regular course.

The following facts can be relied on respecting this terrible malady. It is a disease similar to malaria in the human being. It is caused by a minute, one-celled animal, Pyrosoma bigemina, known as a sporozoan. These sporozoa are in all cattle's blood, if the cattle run on tick infested fields. Cattle that have ever had the disease are not in danger, even though the sporozoa are in their blood. The disease, when it attacks young calves, is light, and seldom fatal. It is always less dangerous when the weather is cool, and if the cattle are in good condition, and not very thick with ticks, even older cattle are safe.

2nd. The disease is carried by the cattle tick, Boophilus annulatus. There are eight different species of ticks that infest cattle, but this is the only one that carries this disease. This tick has a red or reddish brown head. This is really not the head, but is where the head would be if the tick had one.

3rd. While in general the disease must be spread by ticks that come from mother ticks that lived and fed on cattle that had once had the fever, and so have the animal germs in the blood, yet the disease can be conveyed as surely by simply conveying the blood, without the aid of the ticks. Thus inoculation is sure to give the disease. That is, the blood from an animal that has ever had the disease, has the fatal germs, and if injected into the circulation of an animal that has never had the disease, the animal will surely take the disease.

4th. The minute young seed ticks reach the cow from the ground. These give the disease to all susceptible cattle. They live on the cattle, grow fast, suck the blood of their hosts, and in a short time—only a few weeks—are full grown and fall to the ground. In two days they commence laying their eggs, which continues for three weeks, when 2000 may be laid by a single mother tick. These eggs soon hatch, when the now six-legged ticks cluster and wait for a new host, any of the cow kind, to come, that they may repeat the round of life and mischief. If the cow has never had the fever, especially if not young, she usually succumbs to the scourge.

* * *

Dangers.—There are two conditions that are ever a menace, serious and threatening, in case they exist. These are ticky cattle and ticky pastures. If there are no ticks, then there can be no scourge of Texas fever.

Safety.—If there are no ticks either on the cattle or in the pasture, if the cattle have had ticks on them from earliest calfhood, or if they have once had the disease then they are safe. It is possible that an occasional animal may have the fever the second time; in which case it would doubtless be mild. Pastures that have had no cattle in them for an entire year would be safe, as the ticks will all die in a year.

Suggestions.—Those at Palms, and all others interested, should procure at once and read carefully, the excellent experiment station bulletins from Missouri, Texas, Mississippi, Louisiana, Alabama and Florida.

Inoculation either by putting on the cattle a few seed ticks or, better, injecting into the circulation blood from an animal that has had the disease, will produce the fever in a mild form and render the animal ever after safe. This done on very young calves is very safe. In winter it is not likely to prove fatal. Pains should be taken that the cattle be free from the depleting effects of numerous ticks sucking their blood and vitality away. Texas and Missouri have done very excellent work in this line. At the Texas Station they inoculated 1251 cattle, and all had the fever and only 116 died. Usually nearly all would have died, as the fever is usually fatal.

Quarantining against ticky cattle, and keeping all cattle or all ticky cattle out of a pasture for a year will render the pastures tick free. The pastures could be used for horses or sheep, as the sporozan only works on the cattle. Ticks from horses cannot convey the fever.

Thorough greasing of cattle will kill the ticks. I think crude distillate would do, or we could use kerosene emulsion. I believe that either would kill all the ticks, and I do not think that either would harm the cattle. I think that Mr. P. is quite correct in the opinion that pains should be taken to stamp out the ticks and disease. Thousands of dollars have been sacrificed to this disease in parts of Southern California. In the Southern States, where the ticks are so widely spread, inoculation may wisely first claim attention. At Palms eradication of ticks may be the wiser policy.

* * *

ASPARAGUS SCALE.

William Reid, Pomona, asks me for name and remedy for a scale that works on his "asparagus fern." This is Hemichionaspis (Chionaspis))aspidistrae. It works on Aspidistra, ferns, acacias, pepper trees, orange, etc. The scale is nearly white, the female pear-shaped, and the male long and slim and rigid. We find that hand-work washing is a good way to keep them down. I presume that a spray of distillate put on with a hand atomizer would kill the young scale and do no injury to the plants. It should be very dilute and constantly stirred, as it is applied. I believe we are going to find a way to treat our house plants and our garden plants with distillate that will help very decidedly in such cases.

* * *

THE LINNET.

A. L. H., San Bernardino, wishes to have a description of the linnet, and wishes to know how the bird law may be enforced. The linnet is a sparrow and is easily told, as the male has a red head. They are thick about the house, especially if it is vine-clad. They take all of my apricots. To proceed against any one who has violated the bird law, we must first have sure evidence that the person is guilty, and then swear out a complaint before a justice, when, as I understand, it becomes the duty of the District Attorney to proceed against the offender. As it is a criminal case, fine and imprisonment may be the verdict.

* * *

ASPARAGUS RUST.

W. S. Corwin, Highlands, asks how one can treat asparagus seeds to make it safe to plant them. As I said a few weeks ago, in the Cultivator, the best germicide is a solution of copper sulphate, or blue stone, as it is called. Soaking the seed in this will promote the germination, and will at the same time, kill the spores of rust that may be on them. This is the thing to do in case we suspect disease by rust or fungi.

Yet were I in the Imperial or Coachella regions, I would be very wary about getting seed of asparagus from diseased plants. There is no doubt but that these places have a rich field for this delicious vegetable. It is so savory, and so necessary as a spring relish, and the fatal rust is so widespread, that any region that can produce it with success, has a great vantage ground. Imperial and Coachella have a big promise in just this direction. I would take no risk were I in those regions. I know that Prof. Smith says that owing to the dry climate of these regions they have little to fear. Very likely he is true and correct, but where so much is at stake I would take no risk at all. I should also fear that the mycelium threads might have reached the seeds and not be reached by the blue stone solution, so that I should wish seed that had no possible chance of taint. So I urge Mr. Corwin to plant only seed from healthy plants.

* * *

STRAWBERRRY INSECTS.

President Leroy Anderson sends me some strawberry plants that have been injured by insects. They are from Captain M. F. Taylor, of San Simson, Calif. The Captain reports great injury. I find nothing on the roots but Millipedes. These thousand legged worms, as they are called, are quite numerous, and are plant feeders, yet I much doubt if they are the cause of the damage. I have known this same one to be so much worse, that I believe that they have not done the mischief. I fear that the real cause is Fuller's Rose beetle, the great pest which I described in the Cultivator some weeks ago. If so, these would be found only in the summer, and Captain T. will have an eye out next June, when I fear he will find them to be the real cause of his trouble. For remedies, I refer him and others to the article just referred to.

* * *

DIP FOR POSTS.

Fred R. B., Fresno, asks for a dip that will secure posts against decay when set in the ground. Eucalyptus will not decay quickly. Charring the posts will delay rot. Petroleum or, better, coal tar, will prove even better to prevent decay. There are other chemical substances that are more effective, but the expense bars their use.

* * *

BLACK SCALE ON PEACH.

M. J. Howard, Hynes, Calif., has a peach orchard which, he says, has been very healthy and profitable, but of late it has suffered much from the black scale. He has treated it with the lime, salt and sulphur wash and with distillate emulsion, he says, and with no great good. He wishes counsel. I would urge that he call his able horticulture inspector, Mr. F. Maskew, of Long Beach. He would give him the very best advice. I believe distillate spray would be the cure, but it must be used at the right time. Mr. Maskew would give this after inspection. I find that the work of the Scutellista has been so efficient in my trees that I would advise any that are suffering from the black scale to send to the Horticultural Commissioners and get some of the little parasites, and I believe that there will soon be no occasion to treat the scale at all.

* * *

DESTROYING SQUIRRELS.

Delmo W. Muncio, Sis Quoc, Calif., is troubled with squirrels, and wishes a cure. Bisulphide of carbon turned on to a cloth and thrown into the hole when the earth is wet is effective. The hole must be closely filled at once. It will be well for Mr. S. to send to Dr. E. W. Hilgard, Berkeley, for the receipt for squirrel poison recommended by him.

* * *

FERTILIZING BLACK AND LOGAN BERRIES.

K. G. Hommel, Pasadena, wishes to know the best fertilizer to put on his blackberries and Logan berries. I should advise stable fertilizer from some feed stable where the stock had been well fed. Good stable fertilizer will serve excellently well as it will furnish the much needed humus. It might also be wise to apply a little dried blood or treated bone meal with it.

* * *

Editor Cultivator: Please tell me in next issue of your paper, if you consider Santa Rosa, Cal., a good location for one who desires to grow apples and cherries for commercial purposes? If not, why not? and what would be the pests one would have to contend with? Does codling moth live in that climate?—C. W. M., Riverside.

Santa Rosa is the county seat of Sonoma county, a well built, thrifty town, surrounded by an excellent country, devoted to agriculture and fruit growing. Sonoma is one of the best apple sections in the State, and both this fruit and cherries are very extensively grown for commercial purposes. Sonoma is especially blessed in soil and climate for she has a great variety of both and short crops are almost unknown there. Not only do the apple and cherry do well here, but almost every other variety of fruit, including oranges and lemons, which are grown on a commercial scale in this county. In regard to insect and other pests, she has all that can be found in other sections, and the codling moth thrives here and has to be fought as energetically as elsewhere.

FARMERS' INSTITUTES.

The spring sessions of Farmers' Institutes will be held as follows: Anaheim, Thursday and Friday, March 31, April 1; Monrovia, Friday and Saturday, April 1-2; Elsinore, Monday and Tuesday, April 4-5; Hemet, Wednesday and Thursday, April 6-7; Bloomington, Friday and Saturday, April 8-9; Cucamonga, Monday and Tuesday, April 11-12.

Mrs. Minnie E. Sherman, of Fresno, Prof. C. F. Baker, and Mr. Fred Maskew will aid at these meetings. It is also hoped to have a good speaker on poultry culture. These will be the concluding institutes of the year.—A. J. Cook, Conductor of Farmers' Institutes for Southern California.

Choice Fruit
and more of it is the aim of every orange grower.
Nitrate of Soda
(The Standard Ammoniate)
as a Top Dressing in the orange grove will bring young trees into bearing a year earlier and put them into condition to yield larger crops of perfect oranges.
My Bulletin on Orange Growing contains the best information obtainable from actual Experiment Station trials. It is a most valuable addition to the library of any horticulturist. It is free. Send your name and address on Post card.
William S. Myers, Director
12 John St., New York

CITRUS TREES

All the leading varieties. This stock is the cleanest and finest grown. Can fill any sized order and will guarantee satisfaction in price and quality. Write for further information.

W. G. HALL - GLENDORA, CAL.

Strike While the Iron is Hot

And plant your land to lemon and orange trees while the rainy season is on, because then the trees are sure to get a strong foothold and become well established, thus insuring a strong and healthy growth during the spring and summer season.

Good Trees Grow and Bear Fruit

And that is the only kind we have to offer. Being specialists in the growing of citrus trees exclusively, and the largest producers in the world, we believe that we are in a position to merit your consideration, and that we can give you better service in the matter of quality of stock as well as prices, than you will find elsewhere. If in want of citrus trees, let us hear from you.

A Good Thing for the Asking

Having made citrus culture a life study, we have embodied our ideas and experiences in a booklet called "The Yeas and Nays of Citrus Culture," a copy of which will be sent to you if you mention this advertisement. May we not hear from you today? Correspondence a pleasure.

THE
Vernon Nursery
4524 CENTRAL AVE.,
LOS ANGELES, CAL.
Growers of first-class fruit trees, vines, nut trees, flowering plants and ornamental shrubs of all kinds.
We still have a few of the finest two-year-old walnut trees ever grown in California.
You should call and see our apricot and peach trees. They are well grown and have great bushy roots. A large stock of roses, blue gums, etc. If not convenient to call, write for booklet.
A. YARNELL,
PROPRIETOR
4524 CENTRAL AVENUE
LOS ANGELES, CAL.

Coast News and Notes

OF INTEREST TO FRUIT GROWERS, STOCKMEN AND AGRICULTURISTS

HORTICULTURE.

Frank Lobengeir, of Pomono, has sold his ten-acre orange orchard to Mrs. Jones, of Chicago, for $25,000.

Orchardists and fruit packers of Santa Clara, San Mateo, Santa Cruz and Monterey counties have petitioned the Weather Bureau for the establishment of a signal station at some central point in the territory named.

The California Fruit Canners' Association has sent to Watsonvile quantities of pea seed to be planted as a test of soil and conditions there for a prospective cannery site. The seed will be planted part on March 1st and the balance May 1st.

Permanent officers of the Fresno Canning Association have been chosen, as follows: R. K. Madsen, of Parlier, president; F. M. Burnham, vice-president; E. M. Bishop, secretary; these officers, with Wm. Tardiff and J. Q. Anderson, compose the board of directors. The Minnewawa cannery has been leased for the coming season. The membership fee is $1 and shares cost $200 each, $50 cash and notes for balance. No member allowed more than one share.

MISCELLANEOUS.

The Portland, Ore., woolen mills were destroyed by fire last week, loss estimated at $180,000. The mill employed about 150 hands.

The Ventura Free Press states that the grain farmers of the Las Posas and Springville valleys are very active now in the planting of barley.

Berry growers in Tropico and Glendale have organized an association to secure uniform grade of berries, fruits and vegetables, and a uniform price.

There is growing around Laredo, Tex., over 500 acres of Bermuda onions. The seed germinated well this season and the prospects for a big crop are good.

The steam plows on the 5000-acre ranch of Patterson, near Oxnard, are at work and planting is going on. The ranch will be equally divided between beets and beans.

The government has bought from a Portland, Oregon, firm 1250 tons of hay and 4320 tons of oats, which will be shipped during February to the Phillippine Islands.

The Canadian Pacific Railway has given a contract for the construction of an irrigation canal twenty miles long, near Calgary, B. C. The cost is to be one million dollars.

Workmen in digging for a foundation in Oakland unearthed a can containing $1500 in $20 gold pieces. The money had been planted a long time, judging from the looks of the can.

The Victor limestone quarry has already furnished the Oxnard sugar factory with 4000 tons of limestone and the Chino factory with 5000 tons. The stone is used in the clarifying process.

"Tales of the Pioneer Mothers," is the title of a new work by Mrs. Bertha M. Rice, a well-known San Francisco authoress. Doubtless the book will prove highly interesting to old and new citizens of California.

Fresno will observe its first arbor day on March 13th. Committees are at work raising a fund of $250 to spend for trees. Eucalyptus and acacia trees seem to be the species most favored at this time for planting.

The Japanese government has been for some time buying large quantities of flour from the Stockton and other California mills. Enough breadstuffs have been shipped to Japan out of the Golden Gate to feed her army and navy for a year.

A new variety of potatoes brought $750 a pound in England recently. The spuds that brought this extraordinary price are of a new variety and only a few were on sale. One potato sold for seventy pounds sterling. Another sold for $1500 a ton.

WANTED—Good man on farm at Imperial. Must be of good habits and first-class milker. Address Box 104, Imperial, San Diego Co., Cal.

The office and yards of the Loma Priesta Company's planing mill at Santa Cruz burned on Saturady, causing a loss of $50,000.

Millionaire timber land owners of British Columbia are fighting the timber tax of the government, which was recently put into effect. The law provides for a tax of from one to five dollars a thousand on all lumber exported to the United States.

The drillers for gas at Ventura struck another flow of gas at the depth of ninety feet last week. It is now stated that Ventura has a daily flow of gas amounting to 40,000 cubic feet, or more than double the amount necessary to supply that city.

The Ukiah Times speaks of a generous fall of snow in that city and Mendoceno county, and in the same issue brags about the fine oranges at Cloverdale, in the county. For a fact, our northern neighbors have a variety of conditions in climate and fruits.

W. W. Perkins, of McPherson, has shipped to Rochester, N. Y., his fourth carload of rose plants for this season, making a total of over 250,000 plants sent out. He is making preparations to ship half a million plants next year to supply the growing market for California roses.

The tomato growers of New Jersey are circulating petitions to be signed which demand "pay on delivery" from the canners and commission men. Heretofore the growers have had to wait for their pay till December and, as several of the large firms failed last season, the tomato men lost heavily. Hence the move.

The Fresno Democrat announces that the directors of the raisin growers' association have reconsidered their action in donating 100 tons of seeded raisins for advertising purposes at the St. Louis fair. Thus the pet scheme of Fresno county for the distribution of 800,000 quarter-pound cartons has fallen to the ground.

The interested ones in the Danish Creamery Association elected as directors: H. Graff, H. Madsen, E. Larsen, Robert Rhea and P. C. Jacobsen. The year was reported as a remarkably good one, the business having been double that of 1902 and the price of butter averaged 28 cents per pound. The association paid out during the year to its members $130,000, the limit of the capacity of the plant.—Fresno Democrat.

The dispatches state that Herbert Myrick, of the Orange Judd Co., is now investigating land in Mexico and Texas with a view of locating three or four thousand farmers, if good cheap land in a proper locality can be found. Mr. Myrick says that all the good, cheap land in the British Canadian possessions has been settled on, and that the chances for success by the poor man in the Northwest are no longer good.

The Ladd estate at Portland, Oregon, has two Jersey cows at St. Louis on probation for the selection of the 25 cows of that breed for the dairy demonstration opening in May at the Louisiana Purchase Exposition. This couplet of Jerseys are Zaza of Menlo 147312 and Oonan 23d of Hood farm 163228. At present there are 38 Jerseys being tested, divided as follows: 11 Eastern cows; 17 Western; 10 Southern. They are being handled and cared for by four very competent dairymen.

The Department of the Interior has issued an order throwing open the forest reserves of this State to as many cattle as may be kept on them without injury to the properties. The allowance to each reserve is as follows: North division Sierra reserve, 15,000; south division Sierra reserve, 30,000; Stanislaus reserve, 8000; Lake Tahoe, 1600; east division Pine mountain and Zaca Lake, 6000; west division of Pine mountain and Zaca lake, 12,000; Santa Ynez reserve, 650, San Bernardino, 2500; San Gabriel, 350; San Jacinto, 1700; Trabuco Canyon, 500.

CONTINUED

LIVE STOCK.

The Vallejo tannery has begun operations. It has a capacity of one hundred sides of leather per day.

The Russian government has ordered from Cudahy Packing Company, of Omaha, 1,000,000 pounds of beef to be shipped from San Francisco.

Anthrax has appeared among the cattle in Marin county, and is spreading rapidly. Quarantine and sanitary regulations will be enforced.—Ukiah Times.

Beautiful Belle, the greatest brood mare in the world, so claimed, died Saturday at Palo Alto. This mare gave to the turf more 2:30 class performers than any other mare that ever lived.

Exports of cattle, sheep and hogs for the year just ended, says the Arizona Cattleman, have been heavy, i. e., $37,000,000, against $24,000,000 in 1902, and $35,000,000 and $32,000,000 in 1901 and 1900 respectively.

The Jersey Breeders' Association of Southern California will hold its annual meeting at Buena Park, March 15. A large attendance is expected. This is one of the most interesting meetings of the year and brings out the breeders in full numbers.

That the disease commonly known as lumpy jaw can be communicated to human beings with fatal results was proven in the case of William Chase, a young Spokane county, Washington farmer, who died last week after nearly a year's illness of the disease.

The National Association of Wool Manufacturers estimate the number of sheep on hand in the United States at 39,284,000 as against 42,184,122, a year ago. There is on hand 287,450,000 pounds of wool, as against 316,341,032 pounds in 1903—a decrease of 28,891,-032 pounds.

Thos. Vestal, of Two Rocks, has 3000 laying hens. Twice a year he sprays his 100 poultry houses with phenolene. He puts the pheolene in a large barrel-force-spray-pump, which is loaded on a wagon. Then one man drives around while another man works the pump.

MISCELLANEOUS.

The richest ore ever found in Arizona has been discovered southwest of Kingman.

Ventura county will send a huge bean elk to the St. Louis Exposition as part of its exhibit.

Within four years the price of cod liver oil has increased from $21.00 per barrel to $115 to $120 per barrel.

All trunk railroads to the Pacific coast have granted a single fare rate to the Methodist General Conference, to be held in Los Angeles in May next.

A fire in the San Bernardino county hospital last week, destroyed about six thousand dollars' worth of property. There were about 80 inmates, but none were injured.

Gov. Pardee has appointed Col. J. B. Lauck, of Oakland, adjutant-general of the State, to succeed Gen. Geo. Stone, term expired. The new official's commission has been signed, and he will formally assume the duties of his office at once.

Pending an investigation of the feasibility of the establishment of the proposed Monterey forest reserve. The general land office has ordered the temporary withdrawal of 130,000 acres of land in the San Francisco land district.

Tourists are arriving in heavy trainloads. Large excursions are due here within the next few days, and the hotels will soon take on the gala appearance which marks the height of the winter season.—Santa Barbara Exchange.

The recent $75,000 issue of the Whittier school bonds has been approved by the supervisors and ordered sold this week. It is considered probable that the State will purchase them, as it did those of the Pasadena and Pomona districts.

Dolgeville is assuming the airs of a manufacturing center. The Talerday Company has acquired a large tract of land near the Dolge plant and will begin at once the erection of buildings that will be used for making pipe and steel specialties.

Figures published by the officials of the San Francisco Mint show that in 1902 California produced gold valued at $17,197,962, the Klondike $14,743,-455, and Alaska $8,283,408. In 1903 the California production was $16,535,-521, the Klondike $12,240,425, and Alaska $6,921,157.

Instead of the customary formula "in the name of God, amen," the will of Jonathan Coykendall, at San Jose, filed Monday of this week, begins, "In the name of justice and common sense." Coykendall, who died a few days ago, was one of the most prominent business men in the county.

The combined resources of the nine city and seventy-three interior savings banks in California, January 23, 1904, were $283,942,865, and their aggregate deposits on that date were $220,029,676. Since September 8, 1903, these aggregate resources have increased $51,825,680 and their aggregate deposits have increased $7,161,758.

The Pasadena Farmers' Club held its monthly meeting at Recital Hall on the 25th. Music, an address on Fruit in Mexico, Cuba and Porto Rico by Frank Disbrow, Artificial Pollenization, by W. A. Butterworth, New Methods of Shipping Lemons, by T. J. Ashby, made up the program.

Tom Reynolds, nephew of Postmaster J. E. Reynolds, at Redding, opened over eight hundred letters and extracted what coin and paper money he found in them, during the past three months, while employed as utility clerk in the Redding postoffice. He made confession when arrested at the instance of Postoffice Inspector Coyne.

The steamer China arrived in San Francisco Sunday from the Orient, bringing one of the richest cargoes landed here for many months. The notable shipments consisted of 787 cases of opium from Macoa, valued at about $400,000, duty paid; 1935 bales of raw silk, valued at $1,355,000, and a consignment of Japanese gold yen, worth $1,075,000.

The Riverside Chamber of Commerce is taking a lively interest in the Lewis and Clarke Centennial to be held at Portland, Or., in 1905. The chamber has telegraphed to Senators Bard and Perkins and all the California Congressmen, urging them to use all legitimate influence to make Congress pass favorably upon the $1,775,-000 appropriation asked.

The supervisors of Modoc county have adopted the plan of publicity to prevent tax dodging. They decided to publish the full assessment of every taxpayer to be made this year. Every tax payer in the county will thus know how his neighbor is assessed and will be expected, as a matter of self-protection and in the interest of an honest assessment, to report all ommissions of the assessor to the county board of equalization. The plan is a new one and the results will be watched with considerable interest.—Ukiah Times.

The Board of Bank Commissioners this week issued a statement of the condition of savings banks in the interior of California, as shown by their books at the close of business on January 23, 1904. These banks now number seventy-three, or fourteen more than existed on September 8, 1903. The resources of the interior savings institutions now aggregate $117,476,-090, showing the large increase of $48,-862,584, since last Septmber; and their deposits, now amounting to $65,122,-974, have increased $3,676,268 in the same time.

C. H. SESSIONS, ASSOCIATE EDITOR

KEEPING CREAM TOO LONG.

Editor Cultivator: Would you kindly tell me through the columns of the Cultivator the cause of butter becoming rancid in three or four days after churning. I am very careful with the milk utensils, washing, scalding and airing thoroughly. The milk always keeps well even in the hottest weather. The cow is apparently in excellent health, and the milk looks and tastes as usual. We feed alfalfa hay, pumpkins and bran. The cow has been fresh since the last of October, and the condition spoken of has been since then. Your opinion in this matter would be greatly appreciated by, Subscriber.

It is possible "Subscriber" is keeping the cream too long before churning. It should not be held longer than 36 hours. We would suggest the milk be kept in an entirely new location, after thoroughly washing and scalding all the utensils coming in contact with the milk, and especially soaking and washing the churn with a solution of concentrated lye or caustic soda to make sure there is no obnoxious germ hidden away. It is possible extra precautions will stop all trouble. We do not think the trouble is with the cow or the feed.

LIST OF TESTS ACCEPTED FOR RECORD BY AMERICAN JERSEY CATTLE CLUB.

Private Butter Tests.

Brenda's J. B. Clover 107676—Sire Benda's John Bull 20093; dam, Comite of Briarcliffe 74250; butter, 15 lbs., 3 oz;. milk, 239 lbs., 8 oz. Property of Philip W. Moen, Worcester, Mass.

FEEDING DAIRY COWS.

At a recent meeting of the Minnesota Dairymen's Association, Assistant State Dairy Commissioner A. W. Trow, in the course of a talk on the feeds and methods of feeding dairy cows, told the dairymen that the actual secret of dairying is to be found in two things—cheap feeds and correct feeding. Every dairyman is confronted by the question of what to feed, and not only what to feed, but how much to feed, how to feed and when to feed. The answer to these questions may differ somewhat in different localities; however, the general principles of feeding are the same wherever feed is grown and cows are fed.

THE COW STABLE AND YARD.

Cows ought to be milked in a comfortable, clean, thoroughly drained and well lighted place. Ventilation is best secured by some well constructed and easily operated device rather than by loose boards or accidental holes in a window. The walls and ceiling of the stable may be purified by a coat of whitewash which can be effectually applied with a spray pump. This ought to be used several times in a year. Some cow stables are covered with straw or old hay placed on boards with large cracks between them. No amount of whitewash will keep such a ceiling in a sanitary condition. Chaff and loose straw dropping through the cracks are a constant source of dust and dirt during milking. The floor above the cows ought to be as tight as the walls of the stable. The gutters and mangers of the cow stable should be cleaned daily and plaster or clean bedding spread over the floor. Cows should be tied or stalled in a humane way, made contented in every particular and liberally fed. No loud talking should be permitted during milking

EVERY PAIL OF MILK

owes you a certain amount of CREAM

When a man owes you money, and you want to get it badly, you simply send around a good collector, and if he is a good collector, and the man that owes you is worth it, he'll get it.

THE BEST COLLECTOR IN DAIRY LAND IS A U. S. CREAM SEPARATOR.

It'll collect every drop of cream the milk owes you.

and anything that will excite the cows must be avoided. Driving them from pasture in a hurry or chasing the cows with dogs will diminish the quantity and quality of the milk.—Professor E. H. Farrington, University of Wisconsin.

PALM GLEN JERSEY HERD.

A. B. White, one of the veteran Jersey breeders of Southern California, has disposed of his Echo Glen place, in Los Angeles, and has acquired a nice property at Palms, Los Angeles county, where he has moved to and is now engaged getting together his herd of registered Jerseys. Mr. White has brought from the east at different times twenty-four head of Jerseys in crates, most of which have been sold to other Jersey breeders. Following are some of Mr. Whites notable importations: Recoria 103925, Trumps Paradise 107962, Brown Bessie's Nora 112398, Woodstock Lily 125640, Garfield's Loretta 126864, Garfield's Duchess 127116, Rhyme 125266, Exiles Gladys Pogis 129597, Melia Ann's Juliet 147364, Melia Victor Sally 148,-100, Melia Ann's Inez 147784, Letta's Melia Ann 148215, Riotress Ida 163537, Hettie St. Lambert 164997, Melia's Ethel 164996, St. Lambert's Mary Ann C. 172565, St. Lambert's Lady Jane 177425, Owl's Golden Belle 177464, Golden King's Eloise 168276, Bessie's Upright Duke 43155, Marigold Holyoke 49594, Melia Ann's Lad 56907, King's Victor King of St. L. 62904, Imp. Sultane's Golden Fern 65304.

With his new herd (which he has named Palm Glen Jerseys), Mr. White will keep full records and each cow will be tested. Visitors will be welcomed at the new ranch, which is easily reached from Los Angeles on both S. P. and electric railway cars.

SIMPLE DAIRY RULES.

L. Engelmann of the Rockford Creamery company, North Yakima, Wash., has recently sent out the following rules to his patrons in a bulletin form:

First—Aim to have 28 to 42 per cent cream, First, rich cream will keep better, and, second, the creamery does not want any skim milk. You need all the skim milk for your hogs, calves, and chickens.

Second—In winter time it is harder to separate milk than in summer time; consequently be sure that your milk is warm enough and run your separator a little faster than usual.

Third—Be sure that your separator is level.

Fourth—Keep your separator clean and look especially for the skim milk tubes.

Fifth—Use only the best of oil and clean occasionally all gearing with petroleum.

There is a drawback connected with the separator, viz.: Farmers lose sight of the test of their herds. While we admit that some farmers will soon find out whether their cows are paying or not, there are others who lay the blame on the separator or to the creamery. Don't forget that you can't get a 40 per cent cream out of milk testing 3 per cent only. Perhaps the Rockford creamery may inaugurate a system by which they will test your cows and herds right along.

It is a wrong idea to believe that a cow testing 5 per cent is a good cow. The cow that gives the most butter fat within a year is the most profitable cow, no matter what her test is. Don't get the idea that a certain breed is the only and best breed. A good cow is a good cow, no matter to what breed she belongs. Select the breed you like the best and which is best adapted to your circumstances, and cows that milk ten or eleven months during the year; also they may have only a fair average test.

Important points that a dairyman must keep in mind are:

First—The bull is half the herd.

Second—Raise calves from your best cows.

Third—Sell all your poor cows.

Fourth—Keep your herd in a healthy condition.

Fifth—Feed and milk regularly.

Sixth—Feed only wholesome feed and look carefully to the drinking water.

Seventh—Poor feed and dirty water give tainted milk and impair the health of the cow.

Eighth—Keep your calves growing.

Ninth—Don't feed warm milk one day and cold the next.

Tenth—If you want a good dairy cow from your calf, get a good, long body with well sprung ribs on your calf.

Eleventh—The coat of an animal is a good indication of its condition.

Twelfth—Try to have your cows "come in" in the fall and winter. Winter dairying pays the best; besides you have more time to milk in winter than in summer.

Thirteenth—Try to raise all the hay for your herd.

Fourteenth—Make the most out of skim milk.

Fifteenth—Dairying and hog raising are a good combination.

If this bulletin should find the approval of our patrons and be a welcome guest in their homes we shall issue more bulletins, treating on feeding, breeding, care of milk and cream, etc.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

FEEDING FOR EGGS.

In my last I gave my formula for feeding for eggs, for those who prefer mixing for themselves, I now add Geo. H. Croley's formula for mixed food: By weight, ten parts bran, six of middlings, seven ground or boiled oats, four coarse corn meal, four bloodmeal, two oil cake meal, two oyster shell flour, from five to fifteen parts steamed green stuff, one ounce condition powder to each forty pounds of dry weight. Three to five pounds of this, dry weight, will make the first feed for one hundred pullets. After ten days feed all of this they can possibly eat, but take away any remnants. The blood meal can be increased to six parts, gradually, and the condition powder to two, three or four ounces; use more blood meal and condition powder when everything becomes parched and dry in late summer, but make the change gradually. Steamed green stuff should be increased or diminished according to circumstances. It should be used in abundance when green food is scarce. Make all changes gradually. Fowls that are correctly bred and fed in this manner often lay an average of over two hundred eggs per year. Keep grit, granulated bone, charcoal and oyster shell always before the fowls. I have tried the formulas that Geo. H. Croley, of 508 Sacramento street, San Francisco, gives free, and have found them excellent; also have found him very satisfactory in his dealings. In feeding or forcing for eggs a careful watch should be kept over the appetites of the flock. The lack of appetite is most generally the sign of something being wrong with the flock or the individual hen, and this symptom must be attended to immediately, for it is the first indication of indigestion, and indigestion is fatal to egg production. Indigestion is followed by liver complaint, bowel complaints and death. So watch the appetites. Should lack of appetite occur in any hen, remove her from the flock and give her plenty of green food, in fact one of the best cures for indigestion is a diet of nothing but green food. However, if the flock shows loss of appetite, omit the mash, giving green food in its place and gradually return to the mash. Another point of importance is pure water. Water aids the digestion very much, in human beings as well as in fowls. Fowls being pushed for eggs require plenty of clean, pure water, for an egg contains a great deal of water, but water also is necessary to aid the digestion and if you will observe your hens you will be surprised at the great amount of water they will drink. It is close observation that is needed in this as in all the details of poultry keeping.

Another cause of indigestion, of which I claim lack of appetite is the first symptom, is lack of sharp grit. "There is plenty of gravel on my land," said a poultry keeper to me; "I use no grit." "Has your gravel sharp corners?" I asked. The grit should have three sharp corners in each bit, round stones or gravel with the edges worn smooth, is not sufficiently sharp to grind the food quickly enough for rapid egg production. Lack of grit produces indigestion, sour crop, crop bound, sleepiness and langour, liver complaint, with the symptoms of dark comb, finally the comb turning completely black. Lack of exercise and lack of grit are the causes of many failures.

* * *

"I failed in the chicken business in Denver," said a gentleman to me today, "but I think now I could succeed in California." I think he will if he has grit enough to try again, seeing and remembering where he failed last time. Continued and close observation is necessary, the feeding cannot be done mechanically; observation and experience will teach the amount if feed that is necessary, as no amount of advice from others will do.

* * *

FEEDING LITTLE CHICKS.

I have tried many ways, during many years, of feeding little chicks, and have finally decided that the "chick feed" sold by the poultry supply houses is the best feed for little chickens. It is or should be composed of a great variety of small seeds. This is their principal food whilst in the brooder, or till they are eight or ten weeks of age. I also give them plenty of green food, principally lettuce, of which they are very fond, and when they are two weeks old I give them for their last meal hard boiled eggs, onions and bread crumbs chopped fine, or Johnny cake. I give them all they will eat, sending them to bed with their little crops full. I gave full directions for the feeding and care of brooder chicks in the Cultivator of November 6th, so will not repeat it here, as I have a large number of letters asking questions about poultry.

* * *

ANSWERS TO QUESTIONS.

Editor Cultivator: In the Cultivator of February 5 you say that if any new subscribers wish it you will talk further upon breeding, etc. Please do. It seems to me that "in breeding" and "line breeding" are the same. I would like to know more upon the subject. Is there any book one can get to read up on the subject?—Mrs. A. L. S., San Bernardino, Calif.

I will soon write again about this most interesting subject. Several of the oldest poultry fanciers in the country have written articles on this, but I do not know any books about it.

* * *

Mush-room House.—I feel that you are a friend to all people that are interested in the poultry business. I am very much interested in that line, and am trying to get started in it. You wrote about a chicken house called a "Mush-room house" in the Cultivator; will you kindly tell how to build it for the benefit of all new readers and for my benefit.—Miss G. M., Monrovia.

In the Cultivator of April 25, 1903, I gave directions for making cheap, comfortable small houses. A "mush-room house" is a small house built, you might say, on stilts or legs. It can be made any size but I found three by four or six feet to be a convenient size.

First-Class Incubators and Brooders

The "PACIFIC" is the most sensible Egg Hatching Machine yet invented and does its work perfectly without a nurse or night-watch. Send 4c for my 70-page Catalog No. 2. It tells all about them and has other practical matter on poultry raising, poultry houses, etc,, which makes the book worth a $ to anyone who keeps a dozen fowls.

Mr. Wm. B. Dean, Los Angeles. Stockton, Cal., Dec. 16, '03.
Dear Sir—Have just finished first hatch with my No. 1 Pacific and secured 52 nice, strong chicks from the 62 eggs placed in the machine. Never used an incubator before and am delighted with results, also with my incubator. Yours truly,
Mrs. A. N. Zumwalt.

White Leghorns, Black Minorcas, White Wyandottes and Barred Plymouth Rocks

Trophy Winners at Late Los Angeles Show

In each variety my fowls won a share of the regular premiums, and in some thirteen out of a possible twenty-five, or more than all competitors combined. My winning of First, Second, Third, Fourth and Fifth Premiums on White Leghorn Cockerels was the most striking success of the Show. The winning of the National White Wyandotte Club's Blue Ribbon for the best display of White Wyandottes was equally significant. But over and above all, the winning of the Times Eagle Trophy, the most coveted of all the prizes, awarded for the best display—numbers and quality considered—was the most signal and the most important victory of the entire Show. The handsome Cup offered by The Live Stock Tribune was awarded to my stock on the same grounds. These victories only add to an already long list. My fowls have received first premiums wherever exhibited. Over eighty premiums in the last five years.

My fowls are not only standard-bred, but utility-bred. Hundreds of customers attest their merit. They have proved their superiority both in the Show Room and as Breeders. There are no better fowls to be found anywhere, East or West. Both Stock and Eggs sold under absolute guarantees

25-lb. Sack for 125 Chicks $1.00 — 50-lb. Sack for 250 Chicks $2.00 — 100-lb. Sack for 500 Chicks $4.00

Contains everything they need. No bowel trouble when this is fed. If your dealer does not have it, get it shipped direct. Circular free. Thousands of testimonials.

Geo. H. Croley, Poultry Supplies
508 SACRAMENTO ST., SAN FRANCISCO, CAL.

It is simply a small house without a floor, raised from four to ten inches from the ground, so that the air circulates freely under it, the hens roosing on perches above out of any draught. This gives them fresh air and hens in such a house rarely, if ever, take cold in this climate. I have three of these made of canvass, painted. The only danger is that vermin may get in, but a good terrier will prevent that.

* * *

Chicken Houses.—Editor Cultivator: Will you please let me know how a chicken house large enough for fifty chickens should be built.—Mrs. H. P. S., a subscriber, Watsonville.

Two small houses eight by twelve feet would be better than one house. The style must of course be according to your own taste and your pocketbook. In the Cultivator of April 25, 1903, I gave directions for building cheap houses. If you have mislaid that number send stamps to the office for another.

* * *

Trap Nests.—Editor Cultivator: I have been reading your articles in the California Cultivator, in which you have referred to the trap nests. As I have never seen a trap nest, if not asking too much will you tell me how to make them, and how by such means we are able to learn which hens are the best layers. Please answer in the California Cultivator.—J. P. Allison, Oak Creek, Oregon.

You will find a full description of how to make and use trap nests, with plans and pictures of them in the California Cultivator of January 15, 1904. If you have mislaid it send to the office for another.

* * *

Editor Cultivator: Will you kindly answer for me the following questions through the Cultivator and oblige a subscriber. How can I make cheap brooders and yet be as good and durable as costlier ones? How hot should I keep young ducks, geese, turkeys and chickens while in the brooder? As I am new in raising ducks, geese and turkeys I would like a little information on the subject. What is best to feed these fowls and what portion should I give?—Bell B., Hollister, Calif.

You will find full directions for feeding and caring for turkeys in the Cultivator of January 22, 1904. Full directions for feeding and caring for ducks and ducklings (the same will do for geese) in the Cultivator of March 10, 1903. Full directions for feeding and caring for brooder chicks in the Cultivator of November 6, 1903. I cannot rewrite these articles now, but if you have mislaid your copies send ten cents in stamps to the Cultivator office and tell the business manager what numbers you want; he will send them to you. If you want to raise chickens successfully you had better buy the best brooders on the market; cheap, home made brooders, as a rule prove more costly, from the loss of chicks, than the costlier ones. It is easy enough to hatch chicks, the difficulty is in raising them and the very best of brooders are none too good.

* * *

Editor Cultivator: Can hens be induced to lay in the trap nests described in Cultivator if allowed to run loose upon the farm. Please answer through the Cultivator.—R. F. G.

If they have ever learned to use the nests they prefer them to others, but do not know if yours could be trained to lay in any certain place after running loose and I suppose choosing their own nests anywhere.

Winner Buffalo World's Fair, Los Angeles, Oakland, Fresno

We won nearly every 1st, 2nd and Special on White Leghorns at Los Angeles, December, 1903. The greatest exhibit ever held west of the Missouri.

WHITE LEGHORNS

Our flock was formerly headed by the Prize Cock of the New York show, whose sire also won the first at New York the previous year. Of our bird, the judge said: "The best-shaped bird I ever saw; the finest tail and carriage I ever saw; the whitest bird I ever saw."

Among the choice leaders now of our flocks is Rob Roy, a most perfect specimen of extremely large, snow white birds, winner of 3 firsts at New York State Fair, and other prominent exhibitions. He is also a remarkable sire of prize winners. One of his cockerels is at present among the leading birds of the Eastern States. Romeo, a 7 lb., large, snowy white bird, winner of first at Madison Square Garden, New York's great show, and winner of first wherever shown, as well as being a remarkable sire. Similar remarks apply to Sunny Jim, a high-class large, perfect bird, from various egg producing strains of large eggs.

Best Strains, Best Birds, Greatest Layers, Largest Eggs, Up-to-Date in Every Respect. None better. Lay more and larger eggs, 6 and not over 7 to the pound. Test yours.

To our flock of already choice birds, we have recently added some of the best birds to be found among the most famous flocks of the largest and best Eastern breeders, Selected not only for their Show qualities, but more essentially for their laying qualities of large eggs, which we have always made our strongest point in breeding or selecting. Among them is "WHITE ROSE," first pullet at Madison Square Garden, January, 1901; first prize bullet at Cortland, December, 1900; also winner of Golden Special for highest-scoring bird in Show, 96½ by Zimmer; also her two full sisters, and the first prize hen at Madison Square Garden, New York, 1903. Judge G. H. Burgott says of her in American Fancier, Jan. 17, 1903; "A typical grand bird." Also others equally good from the same pen. and the prize cockerel at the Pan American World's Fair, (we having previously owned the prize cock and infused his blood in our young stock). We now place him as a splendid addition of new stock, and one of the most perfect speeimens of true type of large pure white Leghorns to be fonnd.

"The hens that lay are the hens that pay." Nearly all flocks of White Leghorns are the old small variety, layers of small eggs; our strain is snow white, large birds, bred for many years to lay more and larger e. gs. Ours won many first prizes all over the East at biggest shows as well as Pan-American World's Fair. Such strains of White Leghorns give one-quarter more egg production, cost one-third less for feed and care than any other variety, while the large white eggs sell from 2c to 5c more per dozen. Buy a choice cockerel, the best in California, and improve your flock. Eggs for hatching.

W. W. HOWARD 3024 E. Main St. Los Angeles, Cal.

EGGS FOR SALE

From Thoroughbred White Plymouth Rocks and Indian Runner Ducks. 15 for $1.00, 26 for $1.50. All fine stock.

H. S. THOMPSON, 126 E. Ave. 55, Los Angeles

WHY I BREED WYANDOTTES.

In writing this article I aim to make clear my reason for breeding Buff Wyandottes in preference to any other variety. Having handled nearly all popular varieties in the past twelve years, I feel that I am in a position to form a fairly good opinion of the different varieties.

Buff Wyandottes are persistent layers, especially in winter when eggs are in demand and bring the highest price. As a market fowl they cannot be excelled for quick growth, nice yellow skin, and sweet juicy meat. They are also free from dark pinfeathers, which is a great point in their favor when viewed from the standpoint of market poultry. They make good setters, and if left to raise a brood they are the best of mothers. As for beauty we do not know of anything more pleasing to the eye than a flock of Buff Wyandottes with their proud, blocky carriage, golden buff plumage, yellow legs, bright red face and comb. We believe anyone giving them a fair trial cannot help admiring them and acknowledging them to be the best general purpose fowl.

Your for more and better Buff Wyandottes.—A. F. Ackley.

More and better poultry shows were held the past season than ever before, which certainly indicates a steady and healthy growth in the interest shown in our standard fowls. Prices for poultry products in the markets were unusually high the past season, which will also stimulate a production of market poultry the coming season. Taken all in all, the prospects for the enterprising fancier and breeder was never better than at this time.

Louis S. Fletcher, of Anaheim, breeder of White Leghorns and Buff Orpingtons, announces that in Orpington stock he has some of the best strains in the country. It was the pleasure of the writer to visit the yards of J. R. Riddell recently and he certainly has magnificent stock. This is one of the strains which Mr. Fletcher is carrying.

California Cultivator: Enclosed you will find money order for $1 to pay my subscription to the Cultivator. If your paper contained nothing but the poultry department it would be well worth the subscription price.—C. M. Doxsee, Campbell, Cal.

The citizens of Anaheim are raising money for a city park.

ROUP and CHOLERA

Why do so many so called poultry medicines fail? Because they are made to sell at 100 per cent and not to cure. Palmer Poultry Powder sells on its merits. Roup or cholera is no barrier to the poultry raiser now. Before this famous remedy was tested and its value proven the hatchet was used for roup. Now Palmer's Roup Remedies are used and the fowls saved.

PALMERS POULTRY POWDERS

Trade Mark

You may think your fowls are healthy but do not lay. You buy egg producing food to force egg production. When your fowls are healthy nature fills the egg basket. Don't be deceived by cheap nostrums.

Palmer's Cholera Compound makes and keeps your hens healthy and vigorous and doubles the egg product. To try it is to buy it, to buy it is to make money.

FARM LABOR.

The question of farm labor has become a serious one in many parts of this great country. There is comparatively little inclination on the part of the men of today to engage in agricultural pursuits with a view of making the calling a permanent one. As a rule the life of the farmer is not an attractive one, to the young men, for many reasons. Exposure to the elements in all kinds of weather long hours, isolation, small wages, (as compared with the pay of men engaged in other occupations) scant recognition on the part of the employer. Infrequent opportunity for wholesome diversion or amusement, all contribute to a monotonous existence which palls on the life of young manhood. Under such conditions, the man of today cannot be expected to show as much sympathy for the life as did our forbears. In the earlier days, when the pioneers were engaged in hewing out farms from the forest and draining the prairies there was a comity of interest which begot a feeling of common fellowship and rendered the life more tolerable. Today farming operations have become specialized. The corn grower, the wheat raiser and the stockman have but little in common; and there are still further subdivisions, differing from the old methods, such as dairy farming, poultry farming, bee keeping and fruit raising. The farm hand has not as much to do on a diversified scale as formerly. By the present system he learns less than the farmer did of thirty years ago. The attractions of the village and the city are alluring to the farmer boy, as he gets glimpses of life in these centers of populaton, through the newspapers and in the recitals of tales and incidents as given by the itinerant laborer on the tramp. He is drawn away from the silent fields into the feverish maelstrom of the city, to study for a profession, to learn a trade, to clerk in a store, to work as a porter or drive a team, in the fancied idea that it is better than work on the farm. There are also many men born and bred in the city, who are by nature well fitted for farm life, who cannot be induced to leave their obscure side-streets, noisy, unclean and noisome, to go to the country. They choose to remain and enjoy (?) an unsanitary atmosphere, uncanny associations and to revel in the din and smoke of an artifical existence in preference to a simple life nearer to nature. The causes for all this shrinking from work are obvious. They simply lug in the methods pursued by the average farm owner. If a system was devised for making farm life more attractive and tolerable, there would not be such a dearth of willing workers. It should be taken into consideration that the remuneration for service does not wholly lie in the amount of money paid. Attention to the personal comfort of the men and women employed, a show of personal interest in their welfare and opportunities for wholesome pastimes would make a wonderful change in the farm service conditons of today. The system as practiced in many of the western States tends to the creation of the hobo. It would be as easy to make men instead of hobos by a change in the system.

We were in error in our account of Captain Mitchell's poultry plant when we said he had 250 laying S. C. W. Leghorns. It should have been 750. By the way, it may be in order to say that the Captain's "A Practical Poultry Plant," will be from the press next week. The first order with the cash is already in the Cultivator office. Send in the other orders.

Leader on the List.—Wm. B. Dean, manufacturer of the Pacific Incubator, located at 929 East Twenty-fifth street, Los Angeles, writes the Cultivator as follows: "Business has begun to come my way, and I am pleased to advise you that the Cultivator is the leader on my list thus far." Mr. Dean is not new to the incubator business by any means, as he was the founder of the Reliable Incubator and Brooder Co., and manager of the Des Moines Incubator for nine years.

THE SUCCESSFUL POULTRYMAN.

It pays to keep "pegging away." This was Lincoln's rule, and probably the only one he could have used in working out sucessfully the great problems that confronted him. How the wisdom of it is shown in every busy man's life. Things that look mountain high become as a gentle incline or a level plane if we fix our eyes on a task at hand and keep everlastingly at it.

The man who makes a success of the poultry business, like any other calling, must devote his entire time and attention to some definite end; whether it be the rearing of poultry for marketable purposes or the fancy. If he is thinking of entering the fields of the former, he should first acquire some knowledge pertaining to that branch of the business and not rush into it from some glowing account of high profits.

It takes a great deal of money to stock up a plant and put it on a paying basis from the start and unless one has plenty of the wherewithal he had better begin at the bottom and work up. I think that the way the majority of our successful ones have made their beginning; and, furthermore, I think one should become a specialist in whatever line he takes up; for herein lies the royal road to fame and fortune.

If you are thinking of becoming a fancier, you must first of all have a love for the business, a never tiring feeling to do all you can to procure such accommodations that will insure those that have taken hold of some good condition. Secondly, become a specialist.

Our most successful poultrymen are those that have taken hold of some good fowl that is best adapted to their needs and everlastingly sticking to it, never changing; but keeping the one breed through all the years he is in the business. Yet how many are there of us that can do this? It is a mighty hard thing for a person who loves fowls and would keep all breeds if it were possible.

The man who makes a specialty of a certain fowl can have more birds and better ones than the man of many breeds, because he has more time and space to devote to the one, while the man of many breeds must divide both. The specialist will be building up his strain while the other will be degenerating until the specialist's culls will be the equal of his best birds. It has been our experience in keeping four or five varieties that you receive as many orders for eggs and stock of one variety as from all the others, making it less profitable than if we had but the one.

If we hope to achieve the highest measure of success for ourselves we must put enthusiasm, energy born of

true sympathy, into our poultry operations and retire with its attendant interest in our hearts and minds. Arise with increased determination to stop short of nothing but the top, be a leader and not a follower or half-hearted imitator of others.

Each day will bring us its cares, its perplexities, its measure of the stern realities of life. Mingled with these should be some of the higher ambitions, some thoughts and hopes for better things farther on.

That there is money in poultry if rightly handled is true, but one can't expect a living from it unless carried on quite extensively, and then one must be prepared for losses and plenty of hard work.—Clarence M. Kelly, in Poultry Journal.

PROCURING EGGS IN WINTER.

There has been so much written on this subject that it seems almost threadbare, still people continue to be interested in what is said. I have found that the preparation of hens for winter work is quite different to that required for pullets. Hens, to become good winter layers, must be, when the breeding season is over, kept separate from the cocks and carefully nursed through the molt, which will, with early hatched birds, be over by October 1. We now give them the run of the rye patches and fodder yards, feed them sparingly a well-balanced, egg-producing ration twice daily, keep them slightly hungry, so they are always pleased to forage or scratch for a living. If they are of the White Wyandotte variety, by November over half of them will be laying. The winter laying pullet, to be ready for work by November, should be hatched not later than the middle of May, still I have 22 pullets that were brought out the first week in June that are now laying 10 eggs daily. Much depends upon how strongly their growth is forced during the summer. Pullets hatched in February, March and April will, if given only half a chance, be full-fledged layers by October 1. During October and November, when the price of eggs is low, we store them, not only ours, but buy a great many from farmers, with whom we arrange to keep the cocks confined. We pack them in salt, first a layer of salt, then a layer of eggs, placing them with the small end down, fill in interstices with salt, and cover them to a depth of about a quarter of an inch, then another layer of eggs. These cases we store in a nice clean, cool cellar. Eggs without the germ thus packed will keep for months, and come out fresh and palatable. We market them in December, when the price usually is 30 cents a dozen.

At the close of the forage season, about the middle of November in this latitude, we move our hens and pullets into their permanent winter quarters. We have a frame cottage winter laying house, 32 by 32, 12 feet high, weatherboarded on the outside, inside walls, bricked out and plastered, with a tongue and grooved flooring, and an 8 foot plastered ceiling. The floor space is divided in four pens 15 by 15. One of these is used for a roost, the others for scratching and laying rooms; attached to one of these is a sun and dust bath room 16 by 16, with the south wall made of glass, which is always supplied with dry road dust. The roost room is held at a temperature close to 40 degrees, those adjoining at 50 and the other at 70. This building accommodates 100 hens. When the weather is mild, the exit is left open and they have full range of the premises, they frequent the deserted summer houses, which are kept strewn with wheat chaff and clover straw, sown with a variety of small grain. They never fail to take a stroll through the cow yard. How they do enjoy an outing of this kind! It makes them so happy and contented. All these rooms are well supplied with nest boxes, but they invariably choose the warmest room for laying. We guard very closely the daily ration, feed as great a variety as possible, millet, wheat, rye, boiled oats, raw oats, chopped popcorn and occasionally chopped Indian corn, boiled potatoes and the table scraps, give them a mash twice a week, made of steamed cut clover and bran, with beef scraps and a little salt added. They always have access to ground bone, oyster shell and gravel, with an abundance of fresh water, supplied in two five-gallon fountains set up 12 inches above the floor; also a trough of skimmed milk. The water is very essential; it forms a large percentage of an egg; with a scant supply you can have no prolific egg production. To succeed in winter you must select a good laying breed of fowls to commence with. I have tried many of the leading varieties, and find the White Wyandottes to be the most reliable and profitable layers. I once tried to make winter layers of a collection of barnyard fowls that I purchased from a farmer by the way of an experiment. They had the advantage of the most favorable surroundings, in the way of housing, care and feeding, but the result was a complete failure. To have an abundance of eggs in winter you must breed and care for your fowls with that specific object in view. The principle of speciality, in breeding, applies to all classes of live stock.—L. A. Richardson, in American Poultry Journal.

VETERINARY DEPARTMENT

BY DR. W. J. OLIVER,
109 North Broadway, Los Angeles

DIFFERENT CONDITIONS.

Editor Cultivator: I have three heifers ailing, as detailed below; will be thankful to have your advice about them.

(1) Heifer two and one-half years old, in milk for three or four months; has developed a large fleshy bunch between cleft of jaws where the neck connects.

(2) Heifer coming two years; has had very harsh, raucous breathing for two or three months, almost like a horse troubled with roaring; chokes and sputters when eating her ensilage and hay, but eats feed all up. No external symptoms. Is thrifty and looks well.

(3) Heifer about 15 months old, troubled with diarrhoea, about a week ago as a result, I think, of getting fed some molasses with her corn ensilage and hay. Diarrhoea is not bad now, but she has lost her hearty appetite, only picks at her feed, which has been corn ensilage, alfalfa hay, beets and a little mixed bran and rolled barley. How can I get her bowels and stomach in order again?—Subscriber, Hynes.

No. 1. This swelling may be caused from some foreign substance, such as foxtail, or may be it is a start of lumpy jaw, as that disease is not always on the bone. Apply a cerate of cantharides blister; rub in well; this will scatter or bring to head.

No. 2. This heifer shows symptoms of tuberculosis; give her the tuberculosis test; if there is no reaction you have diseased condition of the pharynx.

No. 3. Give this heifer 1½ pints raw linseed oil, 2 oz. spirits turpentine and 1½ oz. laudanum; one dose; stop ensilage; feed hay until she recovers.

* * *

FOR SCOURS.

Editor Cultivator: My horse scours very much after driving. She eats all right; she also gnaws her manger a good deal. She is in good condition and plenty to eat. What shall I do for her?

Try the following prescription: Pow. opium, 2 oz.; tannic acid, 2 oz.; Prep. chalk, 4 oz.; mix. Give dessert spoonful once or twice a day as the case requires.

ORNAMENTAL TREES.

Miss C. S., Alhambra, wishes a list of trees for large lawn, near house, and along driveway, with the common, as well as botanical name.

Of course every tree has a botanical name, but some have no common name, even in their own native country. Common names are given in the lists below where any exist. "Trees for the lawn" sounds very nice but the lawn must be preserved intact, except for trees and plants along the boundaries. Trees for ornament are largely a matter of taste and the list given below is the taste of the writer, as the tree names occur to him at present writing, in the order of their desirability.

Quercus agrifolia (Field Oak); Quercus Suber (Cork Oak); Jacarauda ovalifolia (Blue Tree Bignonia); Magnolia grandiflora (Bull Bay); Sterculia acerifolia (Flame Tree); Pittosporum undulatum (Victoria Box); Pittosporum engenioides (Tarata); Camphora officinale (Camphor tree); Ficus macrophylla (Moreton Bay Fig); Schinus Molle (Cal. Pepper tree).

Conifers (cone bearers)—Cedrus deodora (Indian Cedar); Sequoia gigantea (Cal. Big tree); Arancaria Bidwillii (Bunya-funya); Abies Nordmanniana (Nordmann's Fir); Cedrus Libani (Cedar of Lebanon); Abies Pinsapo (Spanish Fir); Picea pungens (Colorado Blue Spruce); Cedrus Atlantica (Atlantic Cedar); Pinus Canariensis (Canary Id-Pine); Juniperus communis Hibernica (Irish Juniper).

The above lists do not include the acacias, of which there are many species worthy of incorporation in such a list. Sterculia diversifolia, the Bottle tree is best for driveway, with several acacias a close second. A group of palms should find a place in every ground.

* * *

LARGE FOLIAGE PLANTS.

Editor Cultivator.—Please give a list through your magazine, of ten or a dozen large-sized foliage plants for tropical plantations.—H. R. C., Pomona.

Arundo Donax (Giant Reed) and its variegated forms, Cannas, Cordyline australis and C. indivisa (Palm Lillies or Dracenas), Cortaderia argentea (Pampas Grass) and its variegated form); Dasylirious (Tufted Lily), Doryanthes excelsa or D. Palmeri (Giant Torch Lily), Fatsia papyrifera (Chinese Rice Paper plants) and F. Japonica, Gunnera chilensis or G. manicata, Miscanthus Simensis (Eulalia), Musa Ensete (Abyssinian Banana) and Musa sapientum (common Banana), Phormium tenax (New Zealand Flax) and its variegated form. For a border in front of such plants Carex Morrowi, a Japanese striped sedge, would look as well as anything.

NOT ON THE GRAND JURY.

A sinner who felt the twinges of remorse for an evil life, was moved to speak at a revival meeting. "My brothers and sisters" said he, "I feel as if I ought to confess my wickedness before you all but I will not do so tonight."

"Why," asked the preacher, "the Lord will forgive."

"O, well, I'll wait," answered the convicted soul, "until the grand jury has adjourned, the Lord isn't on the grand jury."

THE APPLE.

The popular opinion that apples have run out, ought not to be entertained by any farmer for a moment. What is there in the nature of the apple, or our soil or climate that should cause it to fail? It is not, like the peach and the quince, a half-hardy tree, therefore liable to be winter killed. It has its enemies, but they can be destroyed without destroying the vitality or character of the tree. There are some varieties that deteriorate, but others take their places. There are partial failures some years, and people begin to prophesy evil and only evil to the apple crop. But there will come bearing years again, if we only have faith and patience, with the addition of good care and culture to our orchards.

Don't hesitate, either, to plant new trees. Every farmer owes it to himself and to his children to set out at least one orchard in his lifetime. How else is the number of apple trees on his farm to be kept good? Go to a nursery, the owner of which you know to be a reliable man, make a selection, during the winter if ground is bare, and have them carefully dug in spring and set out in some lot that has been under cultivation for the past year or two.

Never plant deeper than the tree stood in the nursery row. Never omit applying a mulch to young trees if there is the slightest danger of drouth. Never forget that low, stout (not stunted) trees are preferable to tall, slender ones.

Never forget that a hardy, vigorous productive variety, of medium quality, is infinitely more desirable than a feeble growing, shy-bearing variety of much better quality.

Never fail to have a succession of apples for home use. For this purpose a few trees each of a somewhat larger list of varieties may be selected.

Chemically the apple is composed of vegetable fibre, albumen, sugar, gum, chlorophyll, malic acid, gallic acid, lime and much water. Furthermore, the German analysts say that the apple contains a larger percentage of phosphorus than any other fruit or vegetable.

This phosphorus is admirably adapted for renewing the essential nervous matter, lethicin, of the brain and spinal cord, and is, therefore, valuable as a medicine.

It is, perhaps, for the same reason rudely understood that old Scandinavian traditions represented the apple as the food of the gods, who when they felt themselves to be growing feeble and infirm, resorted to this fruit for renewing their powers of mind and body. Also the acids of the apple are of signal use for men of sedentary habits whose livers are sluggish in action, these acids serving to eliminate from the body noxious matters, which, if retained, would make the brain heavy and dull, or bring about jaundice or skin eruptions. When you bake an apple for an invalid be sure and have it look brown and juicy, and without that lop-sided appearance that is often seen, when it is burst open on one side, and burnt to a cinder on the other.—Green's Fruit Grower.

THE GOAT DIDN'T KNOW.

A little boy following his mother espied a long horned goat browsing not far away. In fear he rushed to the other side of his mother, and, taking hold of her hand asked her if the goat would hurt him.

"Why no, my son," said his mother. "Don't you know you are a Christian Scientist and nothing can hurt you?" "O, yes" answered the boy. "I know I'm a Scientist but the goat don't."

The blockade in the Sierras caused by the collapse of snow sheds and tunnell has ended. Trains are again moving.

Hon. David Rankin, the multi-millionaire of Missouri, has started east. He says "he likes California much, though we raise nothing but luxuries here." Rankin believes in corn, hogs and cattle.

PATIENCE WITH THE LIVING.

Sweet friend, when thou and I are gone
Beyond earth's weary labor,
When small shall be our need of grace
From comrade or from neighbor;
Passed all the strife, the toil, the care,
And done with all the sighing—
What tender ruth shall we have gained,
Alas! by simply dying?

Then lips too chary of their praise
Will tell our merits over,
And eyes too swift our faults to see
Shall no defect discover.
Then hands that would not lift a stone
Where stones were thick to cumber
Our steep hill path, will scatter flowers
Above our pillowed slumber.

Sweet friend, perchance both thou and I
Ere Love is past forgiving,
Should take the earnest lesson home—
Be patient with the living.
Today's repressed rebuke may save
Our blinding tears tomorrow;
Then patience, e'en when keenest edge
May whet a nameless sorrow!

'Tis easy to be gentle when
Death's silence shames our clamor,
And easy to discern the best
Through memory's mystic glamor;
But wise it were for thee and me,
Ere Love is past forgiving,
To take the tender lesson home—
Be patient with the living.—M. E. Sangster.

A SAD LITTLE STORY.

On the Tremont Street Mall late yesterday afternoon hundreds of belated suburbanites paused in their scramble through the slush and snow as they made their way homeward, first to wonder, then to pity and sympathize.

Seated on the edge of the curbstone in front of the Park Street Church, unmindful of the blinding storm that whirled about him, sat a little newsboy, holding in his arms the mangled body of a dog. His pile of papers lay scattered in the snow, and now and again, as a gust of wind swept round the corner, the stray sheets were whirled out into the slushy street. Caring nothing for his little stock in trade or the gathering crowd the little fellow cuddled his dog the closer, and as the full misfortune of his loss came over him, he cried as though his heart would break.

The unusual sight attracted the attention of the passersby and soon a crowd that blocked the sidewalk was gathered about the little fellow and his dog. Many of those who paused to see recognized in the boy one of the newsboys that stand at the entrance of the subway every evening selling papers to those homeward bound. Little by little the boy told the story of his misfortune.

The dog, which he held so closely in his arms, was his pet and playmate, who usually stayed at home with his mother in the West End, but yesterday unable to resist the pleading of the little brown eyes of his playmate, the boy had allowed him to accompany him to Park street while he sold his bundle of papers. All had gone well through the afternoon until shortly after 5, when a gust of wind had blown a paper from his hand just as he was passing it to a customer, sending it scurrying far out in the street. Quick as a flash the dog started after it, and just as he was returning with the coveted sheet in his mouth, a heavy herdic dashed round the corner, striking the little fellow full in the side and bowling him into the street. The heavy wheels passed over the frail body, crushing the little ribs to the ground. Too late the newsboy saw the peril of his pet, and when he reached him the little dog's life had ebbed away and the bright eyes that has so often danced with pleasure at the call of his master were closed in death.

Tenderly gathering the little fellow in his arms the boy carried him to the sidewalk, where he tried with all his might to restore life to the one that had been his chum and companion.

Touched by the devotion of the boy for his dead pet, kind-hearted bystanders made up a collection and offered it to the boy, but he turned them away and gathering the little dog in his arms started down the street toward home leaving his forgotten papers to blow about as they might.—Boston Journal.

HIS ONE FRIEND.

Railroad men are not sentimental. Their life is too full of hard work and nerve-straining peril. Something more than ordinary is necessary to move them deeply, but an incident which occurred recently in the Southwest, and which the Los Angeles Times reports, did move deeply a whole train crew on the Southern Pacific railroad.

The Colton local had just passed a little station called Nahant, when the engineer saw an old man lying at full length on the track only a few hundred yards in front of his engine.

The usual danger signal was given, but the man did not move, and the train was brought to a standstill a few feet from him. A glance at the body showed that the poor fellow was dead. In a few minutes the conductor, engineer and trainmen were all standing round the body.

Up to this time they had not observed the presence of a little black dog, but as soon as they approached his master he made a dash for the nearest man, and for a few seconds fought with all his puny strength to keep the man away.

They were there for the purpose of examining the body, however, to see what could be done, and the little dog was rudely kicked to one side. He did not howl with pain as a dog generally does when kicked. He simply gathered himself up and quietly made his way between the men's legs until he reached his dead master's head, when he placed his little face by the side of his master's and after looking at the intruders a few seconds began to whine, and big tears were noticed running down his nose.

"I had often heard," said one of the trainmen, "that dogs have been known to shed tears, but I never believed it until then, and I have lots more respect for the dog family than I ever before had. When I looked around at my companions some of them were crying, too.

"The old man, who was probably a section hand, was removed from the track with more care than is usually displayed in such cases. His blankets were carefully spread and the body was handled as gently as mother would have done it, all on account of the tears in that little dog's eyes.

"As soon as the dog discovered that our roughness had disappeared he became friendly, and seemed to appreciate what we were doing for his master; but we could not induce him to leave the old man's body, and when the train pulled out he was still sitting by his dead master's body."—Dumb Animals.

THE MOTHER AT HOME.

The mother is the heart of the home. She it is who determines its characteristics and diffuses through it that subtle atmosphere which every sensitive person can feel when introduced into the home circle, and from which can quickly to inferred the ruling spirit of the home. There can be no doubt that the most effective training for children is the training of example, and this truth the mother needs constantly to bear in mind. How can the impatient, querulous, fault-finding mother teach patience and kindness and good temper? How can the vain mother teach humility? How can the mother, greatly absorbed in keeping up the pomps and vanities of life, eager for place and show, teach her children the true principles of a happy life? How can the selfish mother teach generosity or kindness, or the discontented mother teach contentment?—Farm Home.

GETTING OUT OF BED.

Don't jump up the first thing your eyes are open. Remember that while you sleep the vital organs are at rest. The vitality is lowered and the circulation not strong. A sudden spring out of bed is a shock to these organs, especially to the heart, as it starts to pumping the blood suddenly.

Take your time in getting up. Yawn and stretch. Wake up slowly. Give the vital organs a chance to resume their work gradually.

Notice how a baby wakes up. It stretches its arms and legs, rubs its eyes and wakes up slowly. Watch a kitten wake up. First it stretches out one leg, then another, rubs its face, rolls over and stretches the whole body. The birds do not wake up and fly as soon as their eyes are open; they shake out their wings and stretch their legs, waking up slowly. This is the natural way to wake up. Don't jump up suddenly, don't be in such a hurry, but stretch and yawn and yawn and stretch. Stretch the arms and the legs; stretch the whole body. A good yawn and stretch is better even than a cold bath. It will get you thoroughly awake, and then you will enjoy the bath all the more.—Farm and Home.

THE VALUE OF APPLES.

There is scarcely any article of vegetable food more widely useful and more universally liked than the apple. The most healthful dessert that can be placed on the table is baked apple. If taken freely at breakfast, with coarse bread, and without meat or flesh of any kind, it has an admirable effect on the general system. If families could be induced to substitute the apple—sound, ripe and luscious—for the pies, cakes, candies and other sweetmeats, with which children are too often stuffed, there would be a diminution of doctor's bills sufficient in a single year to lay up a stock of this delicious fruit for a season's use.—Science of Health.

RECIPES

Eat Little, but Have That Little Good

A NEW WAY TO PREPARE GRAPE FRUIT.

Those who do not object to a liquor flavoring may prepare the grape fruit, or pomelo, in the following manner: Cut the fruit in half with a sharp knife, remove the pith or core, then pour into each half one teaspoonful of claret or other wine and fill the cavity with ice. Let stand two hours or more. Remove ice before serving.

* * *

Strawberry Foam—Three pints berries, 1½ cups pulverized sugar; chop the fruit or crush with a wire potato masher; stir in the sugar; let stand an hour, add juice of one lemon, same of orange; add last whites of 2 eggs whipped to a stiff foam. This must be done with a silver fork and whipped into the fruit mixture. Set away in a cool place, or on ice, if convenient. Prepare a milk blans mange to serve with it.

* * *

Apple Whip.—Pare and grate one large apple, beat the whites of 3 eggs, add 3 tablespoonfuls powdered sugar, ½ teaspoon lemon; add grated apples.

* * *

Breakfast Sausages—Cut the links apart and prick with a fork to keep from bursting; put in boiling water and boil for 5 minutes; drain off the water and add just enough boiling water to cover the bottom of the pan; boil until the water has boiled away, then cover closely and cook until brown, shaking often to prevent sticking and scorching; dish on a hot platter and keep hot. Peel 5 bananas, cut into lengthwise halves, dredge with flour, place in the hot fat and cook a golden brown and use as a garnish for the sausages.

* * *

Cake Without Eggs.—One cup sugar, ½ cup butter, creamed together; cup sweet milk, 2 teaspoonfuls baking powder sifted in 1½ cups flour; flavor as liked and bake in layers or loaf. By adding different spices and a cup of chopped, seeded raisins this makes a good fruit cake. If baked in layers it may be put together with jelly or any desired filling. This also makes a very good cottage pudding, using the following:

Sauce—One teacup sugar, half teacup butter, 1-3 teaspoonful salt, tablespoonful flour; pour on 3 teacups boiling water; boil for 5 minutes, flavor to taste.

* * *

To cut butter in cold weather heat the knife and all crumbling will be avoided.

WARM FOOT-BATHS.

The warm foot-bath is a remedy so easily to be had in any household, so quickly prepared and so simple to administer, that it is a pity it should not be more universally understood and used. Its possible uses are legion. Only a few of them can here be enumerated.

It is generally understood to be one of the good "old-fashioned" remedies for a cold—especially a cold in the head. It should not be allowed to become old-fashioned for this purpose, for with all our rapid multiplication of "antis" and other new medicines, it still remains one of the best modes we have of combating a bad cold. It must be properly given, but this is a very easy matter. The patient should be well covered as to the body; the pail or other receptacle for the water should be deep and perefectly narrow, for the higher the water reaches up the calves of the legs the better. A heaping teaspoonful of mustard should be added, and the feet should go into the water as hot as can be borne, fresh hot water being slowly added as that in the bath cools. The whole process should last twenty minutes to half an hour, during which a glass of hot water or lemonade should be slowly sipped.

It is perfectly ridiculous for the patient to take the feet out of the water, dry them, and go to clearing up the room, as is sometimes done. Five minutes' attention from a second person is absolutely needed at this juncture, as it is most important that the feet should be quickly dried, and the patient immediately covered up very warm, preferably with a hot water bottle to the feet, in order that the profuse perspiration, which is the principal result to be desired, should not be checked. If this process is faithfully carried out, a cold will generally be found scotched the next morning.

A headache, especially that variety known as "nervous," may often be relieved by a warm, not necessarily a very hot, footbath. The footsore, overdriven housewife can gain blessed relief for aching muscles and tired nerves by ten minutes devoted to a warm foot-bath. A very cross baby can often be converted into a cherub by the same simple treatment. There are many times and places in which it is not convenient to give the baby a warm tub-bath, and then a pint of warm water and a very small basin will serve for the miracle-working foot-bath.—Youth's Companion.

A VALENTINE PARTY.

A description of a Valentine party which I attended this year may be of help to some hostess planning for a similar party for next year. We were received in a room decorated with wreaths of green, hung in festoons caught up at regular intervals with ribbon streamers. From the center of each wreath hung hearts of stiff parchment paper tinted blue and lettered in gold, each bearing a number and a fate or fortune.

Suspended from a portiere rod between parlor and hall were three hearts formed of heavy wire and twined with evergreen, above each one was a jingle. The first said:

"Blow your bubble right through here.
And you'll be married before another year."

And the second:

"To be engaged this very week
Number two is the one to seek."

Above the third:

"A sad and awful fate awaits the one who seeks me,
For he or she will ever unmated be."

On a small table near by was an immense bowl filled with sparkling soapsuds, and also clay pipes decorated with little blue hearts. We were instructed to throw the bubbles off the pipes and try to blow them through the hearts with pretty little fans given us for the burpose; no one found this easy to do for sometimes they would float through number three when we were trying our very best for number one or two. The same idea might be carried out by using small feathers dyed different colors, a different color for each guest.

Another nice game we played was trying to throw different sized hearts over a small stake, a game of ring toss with hearts for the rings, this was great fun for the one who could successfully get them all over once out of three trials was given a lovely valentine. The hearts were made of heavy cardboard and the way they would not go over the stake was surprising.

The partners for supper were chosen in a novel way; the boys were given numbers and the girls' names were written on tiny pieces of paper and rolled in bits of clay, then all were poured into a bowl of water and the first one coming out of its clay home was the partner of number one and so on in the order in which they came to the top.

A "Good Luck" supper was served in the dining room. Directly over the table, suspended from the chandelier hung a floral horse shoe. In the center of the table and at each end were fairy lamps surrounded with horse shoes made from flowers. The souvenirs were clover leaf stick pins and silver horse shoes. The bon-bons, cake, sandwiches and ices either took the form of horse shoes or clover leaves. The place cards were large square envelopes containing a valentine, which was read between courses and provoked much merriment.

After supper, a tray containing as many numbers as there were guests, was passed, and each took a heart with a corresponding number from the decorations on the wall, and read aloud the fortunes there. These were all very clever and some very appropriate.

If one wanted to, the decorations might be carried out in tissue paper instead of evergreen and I for one, must confess that I lean toward the tissue paper for, as all know, the evergreen is a job to clean up. The valetines might be home made ones if one could not get the nice ones and I am sure every one would have just as good a time, for the pleasure of being entertained lies in the hospitality extended rather than in any mere material features.

The invitations were sealed with heart-shaped pieces of blue paper, of the sort that is used to keep tally with at card parties and they are very inexpensive, and one may always get the gilt ones if they cannot get the other colors.—Geneve Much.

The Limited Log Book

In the buffet car of each California Limited train on the Santa Fe there is a "log book," in which passengers are asked to record their impressions of the service.

Here is one impression: "I was on the first California Limited train leaving San Francisco for Chicago. Was so impressed with the good service, splendid attention and fine climate that on my four trips since to New York I always take this grandest of all American trains."

LEWIS D. WALLENSTEIN
With S. N. Wood & Co.
San Francisco, Cal.

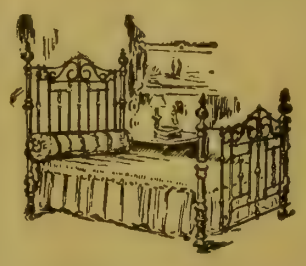
Dependable Furniture at a Fair Price

New Iron Beds

Largest Line in Southern California



We have just received a very large shipment of iron beds, including new pattern enameled in all the popular colors. They are prettily trimmed with brass and range in price from $3.50 up to $60.00. Many of them have the new patent reversible double hook rails, which make them more solid, and either high or low beds. We also have a very fine line of brass beds ranging in price from $28 up.

Hodges' Fiber Carpets

Our new stock is now in, and as we are sole agents for this superior floor covering, it is the only stock in the city. The Hodges Fiber Carpets are more durable than any matting, will not collect dust, are not eaten by moths and are very inexpensive. We have a large line of very pretty patterns. We also have them in rugs ranging in size from 18x36 inches to 9x12 feet.

BAKER'S
TRACELESS HARNESS

No Whiffletrees—No Traces

This harness is indispensable to every fruit grower—vineyardist or orchardist. Saves time, labor and patience. Pays for itself many times over every season in the saving of injury to trees and vines and damage to growing fruit, which always occurs from the use of ordinary whiffletrees and traces. One of the handiest of farm equipments.

We have hundreds of testimonials from every State, like the following:

Sunland, Cal., December 27, 1902.

SIRS: In regard to the Baker Traceless Harness which I purchased from you I wish to state that when using it on the team among my trees, I know of no improvement which can be made on the outfit unless I cut the legs off the horses. It is impossible to injure the trees or fruit while using it.
Yours well satisfied, T. G. CUSHMAN.

Sebastopol, Cal., March 29, 1902.

DEAR SIRS: Your harness is all you represent it to be in every particular. We judge it a big success for plowing vineyard and orchard.
Yours very truly, C. D. HAMILTON

Don't delay—write us to-day for illustrated catalogue of this valuable harness, mailed free for the asking. Live agents wanted everywhere.

HOOKER & COMPANY, 16-18 Drumm St., San Francisco, Cal.
Sole Agents For California.

When writing to Advertisers Please mention Cultivator

Los Angeles Markets.

Los Angeles, Feb. 25, 1904.

The local markets have shown no special activity for the last few days. The usual amount of strength prevails over nearly all lines, due to the continued scarcity of rain in this locality.

Butter.

Butter underwent no change at the last meeting of the Creamery Board of Trade, but conditions are improving in the way of feed, and the supply is likely to see a gradual increase, which will cause prices to drop accordingly.

B. of T. Creamery, 2lb roll		70
So. Cal. dairy do	60	62½
Cold Storage	50	55
Cooking, lb.,	21	23

Cheese.

Best domestic grades are in fair demand, and remain firm at the prices quoted.

Ranch, good to choice	24
Store	22 @23

POULTRY—Old Roosters, per doz., $5.50@6; young Roosters, $6.50@8; Fryers, $6@6.50; Broilers, large, $5@5.50; small, $4.50@5; Hens, small, $5.50@6.50; large, $6.50@7.50; Ducks, per doz., old, $5.50@6.50; young, $6.50@7.50; Live Turkeys, per lb., 15@17c; Dressed Turkeys, per lb., 18@22c; Geese, per pair, $2@2.25; Goslings, $2@2.25; Pigeons, per doz., old, $1.25@1.50; Squabs, $2.25@2.50

Fruits and Vegetables.

Oranges and apples are about the only fruits moving in quantity. Oranges are moving liberally, some small export orders being filled.

DECIDUOUS FRUITS—Apples, per box, common to choice, 50c@$1; fancy, $1.25@1.50; extra, $1.75@2.

Pears—Per box: Winter Nellis, $2.50@3.

CITRUS FRUITS.—Per box: Oranges, Navels, fancy, $1.50@2.50; choice, $1@1.75; standard, 65c@$1.25, according to size; Seedlings, 50c@90c; Lemons, $1@2.50; extra, $2.75; Grape Fruit, $1.25@2.50; Tangerines, 50c@$1.25; Limes, $6@6.50.

In vegetables there has been a brisk trade. Potatoes are materially advanced, with heavy receipts of Oregon Burbanks, some of which have sold as high as $1.50. Sweets are quickly picked up at advanced prices.

VEGETABLES—Asparagus, per lb., 25@40c; Tomatoes, per box or crate, southern, $1@$1.75; Rhubarb, per lb., 12½c; Green Peppers, per lb., 20@30c; Dried Peppers, Stockton, 5@8c; southern, 8@12½c; String Beans, per lb., 15@20c; Green Peas, per lb., 6@8c; Egg Plant, per lb., 20@30c; Summer Squash, per box, $1@$1.50; Cucumbers, hothouse, per doz., 50c@$1.25; Mushrooms, per lb., 10@15c; Garlic, per lb., 5@7c; Dry Okra, per lb., 12½c; Marrowfat and Hubbard Squash, jobbing at 3@1¼c per lb.

POTATOES—Per ctl.: River Burbanks, $1@$1.15; Early Rose, $1@1.10; River Reds, $1@$1.10; Garnet Chile, 90c@$1.05; Salinas and Lompoc Burbanks, nominal: Oregon Burbanks $1.25@1.40; Nevada, $1.35; Tomales, $1.10@1.20; Sweet Potatoes, $2.25.

ONIONS—Per ctl.: Oregon, $2.65@2.75; Nevada, $3.

Dried Fruits, Nuts, Etc.

Dried Fruits are tame and with no material change in prices.

DRIED FRUITS—Prices for carload lots f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 4@½c; Sun Dried, 3½@4½c.

Apricots—Royal, fancy, 9¼@10c; choice, 8½c@9c; Moorpark, choice, 10@12c.

Peaches—Choice, 5¼@6¼c; fancy, 6½@7¼c; peeled, in boxes, 11@14c.

Pears—Choice, 7½@8½c; fancy, 9½@10c.

Plums—Pitted, 6@9c; unpitted, 2c.

Prunes—Four sizes, 60s to 100s, 2½@3c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Red, 4@5c.

Figs—White, 3@4c; Black, 4@4½c.

NUTS—Per lb: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Pecans, 11@13c; Peanuts, Eastern, 6@6½c; do, California, nominal; California Walnuts, soft shells, No. 1, 13@14c; do, No. 2, 11@12c; hard shells, No. 1, 12@13c; do, No. 2, 10@11c; Chestnuts, Italian, 5@7c.

HONEY—New Comb, per lb., White, 10@12c; Amber, 8@10c; Extracted Water White, 5½@6c; Light Amber, 5@5½c; Dark Amber, 4½@5c.

BEESWAX—Per lb., 26@28c.

Hops.

The price for the new crop is 27@30c per lb, according to quality.

Beans.

Beans are stiffening with strong eastern demand. Quotations are:

BEANS—Prices per ctl: Large Whites, $2.55@2.75; small do, $2.90@3.15; Pea, $3@3.25. Lima, $3.25@3.32½; Red, $4@5; Pink, $3@3.15; Bayo, $2.35@2.50; Blackeyes, $2.10@2.25; Red Kidneys, $4.50@4.75.

Live Stock.

Live stock values are maintained with a marked degree of firmness and dealers report a lively market for first quality stock of all descriptions at the top quotations.

CATTLE—No. 1 Native Steers, 8½@9c; second quality, 8c; thin Steers, 7@7½c; No. 1 Cows and Heifers, 6¼@6¾c; second quality, 5½@6c; thin Cows and Heifers, 3½@4½c; Bulls and Stags, 3½@4½c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4¾@5½c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb.: Fat Wethers, No. 1, 4½c@5c gross weight; Ewes, No. 1, 4@4¼c, gross weight.

LAMBS—Fat Lambs, 4¾@5¼c per lb., live weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs. and over, 5½@5¾c; weighing under 130 lbs., 5¼@5¾c; weighing 200 to 350 lbs., 4¾@5c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

HAY—Per ton: Wheat, $15@18; Wheat and Oat, $15@18; Oat, $15@17; Barley, nominal; Clover, $13@14.50; Alfalfa, $11.50@13.50; Stock, $12@13.

STRAW—Good to choice, per bale, 60@75c.

OIL CAKE MEAL—In lots of 20 tons, $29 per ton; 10 tons, $30; 5 tons, $30.50; less quantiti, $31. Prices are mill rates and are subject to change without notice.

OILCAKE MEAL—In lots of 20 tons, $29

CRACKED CORN—Choice quality, per ton, $29@30.

FEED CORN MEAL—Choice grades per ton $28.50@29.50.

GROUND BARLEY—Per ton, $24.

COCOANUT CAKE—In lots of 10 tons, $21; 5 tons, $21.50; less quantity, $22. Prices are mill rates and are subject to change without notice.

Cereals.

FLOUR—Net cash, Family Extra, $4.80@6.10 per bbl; Bakers' Extra, $4.60@4.80; Oregon and Washington, $4.10@4.60.

WHEAT—No. 1 Shipping, per ctl., $1.42½; choice, $1.45; White Milling, good to choice, $1.47½@1.57½.

BARLEY—Choice No. 1 Feed, $1.11¼@1.13¾; off grades, $1.08¾@1.10; Brewing No. 1, $1.15@$1.21¼; Chevalier, nominal at $1.20@1.40.

CORN—Good to choice, per ctl.: California, new, large Yellow, $1.40@1.45; small do, nominal; White, $1.40@1.45; Eastern, $1.32½@$1.37½.

CRACKED CORN—Choice quality, per ton, $29@31.

OATS—Good to choice White, $1.27½@1.40; Red, $1.30@1.35; Black, nominal at $1.27½@$1.40.

RYE—Good to choice, per ctl., $1.30@1.32½.

WOOL.

There is no material change in wool.

Fall clip, per lb: California Plains, 6@8c; Foothills, 8@10c; Middle Country, 10c@12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

CHICAGO, Feb. 24.—The wheat market opened strong. Higher prices at Liverpool in the face of the severe slump here yesterday were sufficient inducements to buy. Initial quotations of May were 1 to 1¾ higher, at 1.05@1.05¾. July was up ¾ to 1, at 93⅜@93¾. Prices started upward, and soon recovered all the early loss. The strong cash situation was an additional bull influence. Offerings, however, were light, and in consequence the market became exceedingly strong.

Cash quotations were as follows: Flour was firm; No. 2 spring wheat, 98@1.05; No. 3, 89@1.02; No. 2 red, 1.03½@1.08⅝; No. 2 corn, 53½; No. 2 yellow, 54½; No. 2 oats, 43½@43¾; No. 3 white, 41@45¾; No. 2 rye, 73½@75½, good feeding barley, 42@43; fair to choice malting, 48@58.

DAIRY MARKET.

On the Produce Exchange today the butter market was steady; creamery, 14@16; dairy, 13½@22; eggs, easier, 19@22; cheese, firm, 10½@11¼.

Dried Fruits, Nuts, Etc.

NEW YORK, Feb. 24.—The market for evaporated apples continues quiet at former prices. Common are quoted at 4@5; prime, 6¼; choice, 5½@6½; fancy, 6¼@7. Prunes ruled firm, with Coast advices indicating a hardening market. Prices range from 3½@6½, according to grade. Apricots, choice, 9¾@10; extra choice, 10¼@10¾; fancy, 12@15. Peaches less active. Choice quoted at 7¼@7¾; extra choice, 7¾@9¼, and fancy, 9@10.

Live Stock.

CHICAGO, Feb. 24.—Cattle—Receipts, 24,000; market slow; good to prime steers, 4.90@5.75; poor to medium, 3.50@4.75; stockers and feeders, 2.50@4.10; cows, 1.75@3.90; heifers, 2.00@4.50; canners, 1.75@2.50; bulls, 2.00@4.00; calves, 3.50@7.25. Hogs—Receipts today, 45,000; tomorrow, 46,000; strong to 5c higher; mixed and butchers, 5.15@5.55; good to choice heavy, 5.55@5.65; rough heavy, 5.25@5.50. Sheep—Receipts, 30,000; sheep and lambs steady; good to choice wethers, 4.25@4.50; fair to choice mixed, 3.65@4.25; western sheep, 3.20@5.25; native lambs, 4.00@5.75; western lambs, 5.00@6.00.

CITRUS MARKETS

THE ORANGE MARKET.

The week's market has been somewhat varied in activity, owing to the cold weather during the closing days of last week, and the first of the present week. However, Tuesday witnesed a rally in demand for fruit, as the weather became warmer, with fairly satisfactory prices.

Fifty-seven cars of California oranges were sold at auction, the Agency selling 40 and the Independents 17, with prices ranging from $2.06 to $3.00. On this date about 14,000 boxes of Sicily lemons were sold. There was a decline in fruit which was held over, so much so, that delayed cars brought less than expenses.

Wednesday 45 cars of California oranges were sold. The market was active and all accumulated orders were filled promptly. The Sicily lemon market was higher by 15 to 25 cents. Dealers are waiting for warm weather and predict an active market, when the weather shall moderate and stay steady.

AUCTIONS.

NEW, YORK, February 18, 1904.

C. C. U. Highland Highlander Navels, $1.50.
Covina Fruit Exchange, XX Navels, $1.50.

Riverside Fruit Exchange, Blue Globe Navels, $2.10.
A. C. G. Fruit Exchange, Stag Navels, $1.75; Pointer, $1.70.

Total to date this season, 7468 cars, of which 664 cars are lemons.

Total to same date last season, 5826 cars, of which 674 were lemons.

Warm weather has prevailed in all sections most of the week. In Southern California the rainfall was most timely, giving a fresh start to grain which had sprouted after the preceding rains, and greatly improving the condition of pasturage. With the customary spring rains it is expected that fair crops of grain and hay will be raised in most parts of the south. Grain continues in excellent condition in the central and northern sections, and prospects are good for large crops. Green feed is abundant in nearly all sections and cattle are improving.

Catalogue for 1904—The nineteenth annual catalogue of the Germain Seed Co. is just from the Kruckeberg press. It follows the custom of giving a large amount of information, besides the descriptive list of seeds and plants offered. For instance, the planting calendar and the reference table give at a glance the time of year when any particular plant or seed should be planted.

Besides the plants and seeds are descriptions and illustrations of garden tools and appliances. The poultry department is only given a page or two, as a special catalogue is issued for that department. The issue consists of 10,000 books.

* * *

Announcement is made of the retirement of D. M. Lord, president of the business of Lord & Thomas, advertising agents, Chicago. The firm has a long record in the advertising business and has built up one of the largest houses of its kind in the country. A. L. Thomas will succeed to the presidency and continue as head of the firm.

* * *

The Killifer Griffith Manufacturing Co. are now located in their new building on the south side of Palmetto street, Los Angeles, and for the first time have abundance of room for manufacture and storing of the Killifer cultivator and the various trucks, scrapers, subsoilers and other farm tools. The latest is a drill for drilling in wheat, barley or other grain. The two teeth of the cultivator, which loosens the ground are followed by the seed conductor, and the plowing, the seeding, the harrowing, are all done at once. Its simply the adapting of a seeder to the cultivator, but by putting on eight or ten horses most rapid work is done.

BRIGHT CELERY PROSPECTS.

The celery growers in Orange county are exceedingly happy over the prospects before them. The association of celery growers has just compiled a statement of the scope of the business which shows it to be in a most healthy condition. For November, 219,227 dozen bunches, selling for $32,000; December, 499,805 dozen, selling for $78,000; January, 404,293 dozen, selling for $71,400. This makes a total of 1,123,325 dozen bunches, selling for $181,200. This represents net cash to the growers after all the shipping expenses have been paid.

To a Times reporter Manager Curtis said recently:

"February will be the largest month of the season for the business. We are proud of this showing in the face of the scarcity of rain and our whole crop is taken care of. Much of it will go into cold storage in New York City to meet the demands of the summer business. Celery is often kept over a year, and comes out fresh and brittle. There are now 2500 acres of land planted to celery in what is known as the Westminster district, and almost all of the land favorable for planting has been taken up for next year. The statement of the shipments for ninety days which have been given do not take into account the consumption of the local market, which has probably amounted to forty cars. The Celery Growers' Association is now in its twelfth year, and is doing exceptionally well."

WINTER SPRAYING OPERATIONS.

The late rains have interfered with spraying operations in Pajaro valley to some extent, but the work is once more being prosecuted with due diligence. Orchardists are taking hold of the work with commendable zeal and spraying is being carried on on a much larger scale than last season.

Practical experience has demonstrated conclusively that in the case of scale the lime, sulphur and salt spray has no superior, and its use this season is very general. Not only is it used to great advantage in California orchards, but orchardists in Washington, Oregon, Idaho, Montana and throughout the Central West and East are applying it to their scale-infested trees with most satisfactory results.

The good work that is being done in this valley is a source of satisfaction to the Horticultural Commissioners and augurs well for the fruit interests of this section.—Panjaronian.

GIVE YOUR NAMES.

There are questions submitted to the Cultivator for answer from Anderson, Los Gatos, Rocklin and Elsinore, but in each case no name is attached. Let it be understood that no attention is paid to questions where no name is signed. The full name must be given, not for publication, but as a guarantee of good faith.—Editor.

The Imperial Date Company has ordered a consignment of Neglet Noor trees from Algiers, with which, in March, two acres will be planted. Later several thousand trees will be imported if conditions are favorable for the development of the business.

For Sale or Trade

Three hundred and twenty acres near Hemet, 50 acres under cultivation, balance pasture and bee land. Three springs, house, barn, chicken houses, yards, etc.

Ethel G. Smith **Hemet, Cal.**

ALIAS SUMMONS.

No. 42415.

In the Superior Court of the State of California, in and for the County of Los Angeles.

Chas. B. Estill, plaintiff, vs. Mollie Estill, defendant.

Action brought in the Superior Court of the State of California, in and for the County of Los Angeles, and the complaint filed in said County of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Mollie Estill, defendant.

You are hereby directed to appear and answer the complaint in an action as above brought against you in the Superior Court of the County of Los Angeles, State of Cali., this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the court for any other relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the County of Los Angeles State of California, this 20th day of January A. D. 1904.

(Seal) C. G. KEYES, Clerk.

By C. O. WINTERS, Deputy Clerk.

200-EGG HENS

And How to Get Them

Buff Orpingtons
Courtesy of Captain Mitchell,
Santa Barbara

You want 200-egg hens? Undoubtedly you do. There is a way to get them. In fact, you can make them out of your own flock of poultry. Why be satisfied with hens that lay only from 50 to 100 eggs per year, when you can have hens to lay 200 eggs per year per hen?

We have learned how to make 200 eggs per year hens and we can make your hens lay that many if you will GET THAT AMBITION and follow these instructions:

1st. Commence with the little chicks. They must be fed on the proper food to FULLY NOURISH THEM so that they can be developed into good layers later on. Therefore it is necessary for their future welfare that these chicks be fed on COULSON'S CHICK FOOD.

Now, of course, it is necessary also that you take good care of pour poultry at all times. Be sure to keep them clean and disinfect their houses with lice killer at least once a week. If you are willing to do this then you are willing to strive for 200 egg hens and we can help you with the SCIENCE OF POULTRY FEEDING.

2nd. The pullets and hens that you wish to develop into good layers and 200 egg hens: feed them a warm mash every morning of COULSON'S EGG FOOD. "No other kind is just as good." NO OTHER KIND is good enough; so if you want 200 egg hens it is necessary that the hens get COULSON'S food for then they get the PROPER FOOD.

At noon, at toward evening, feed the hens Coulson's Scratching Food (which is composed of wheat, corn, hulled oats, etc.) and give the hens plenty of green stuff and plenty of clean fresh drinking water, feed Coulson's food every day and you will develop a strain of 200 EGG HENS.

If your feed dealer hasn't got Coulson's Scratching food, ask him to get it for you. Send for circular describing it.

Many of the largest poultry farms in the county feed Coulson's prepared poultry foods exclusively and purchase it in car load lots.

Situated on the coast in Marin Co., overlooking the Pacific ocean is the 1000 acre ranch of John McDonald, who has, in connection with his dairy ranch, about 2000 hens which are being fed on Coulson's Egg Food. Only a few days ago we shipped him 200 sacks Egg Food and also 50 sacks of Chick Food to feed the thousands of little chicks which he is hatching out.

William Bassett, Tomalis; Geo. Gaston, Two Rock; and A. D. Rezendes, Tomalis; are other large poultry raisers who feed carloads of Coulson's feed.

You can get cheaper foods than Coulson's but they do not contain all the necessary articles and if you want to develop good layers and make the most profit out of poultry, feed Coulson's prepared foods; costs a trifle more than some other kinds but gives GREATEST RETURNS.

When you buy common feed you pay $24 or $25 a ton and it contains about 100 pounds of protein. Now, a ton of Coulson's Egg Food contains about 200 pounds of protein or in other words, there is as much protein (egg and flesh making substance) in ½ ton of Coulson's feed as there is in one ton of common feed. So you are making a great mistake if you don't buy Coulson's feed.

The season is now at hand when the majority of the poultrymen are hatching out chicks by the bushels and a great many are hatched to what sad end?

Have you ever stopped to think how many hundreds, perhaps thousands, of chicks you would have if these fine hatches would not die off so rapidly?

It is to our interest and our business to prepare a feed for little chicks so that the poultrymen can raise the most chicks possible and to have them grow fast and reach maturity quickly and be big, strong, healthy chicks, and we do not only believe, but we know that we have a Chick Feed that fills the bill perfectly and properly.

Only a few days ago we sent 30,000 pounds of this Chick Food to one party. Our Chick Food is used and recognized to be the best by the most thorough and up-to-date poultrymen and the largest poultry farms in California.

For instance, Purvine, Thoergesen, De Rezendes, John Marshall and others out in Two Rock valley, where the largest poultry farms in California are situated. These gentlemen all keep from 3000 to 7000 hens and they have to hatch thousands of chicks every year to keep up such large flocks. They have been in the poultry business for years and have had plenty of experience and tried all kinds of feeds and ways of feeding chicks, and they have now decided that hereafter they will feed Coulson's Chick Food exclusively until they get at least 6 weeks or 2 months old. They have found out that they can raise the most chicks and the nicest chicks on Coulson's Chick Food. These men use tons and tons of our Chick Feed.

Now, perhaps you will say that you are going to try a little millet seed or cracked wheat, rice or oatmeal, etc. But, my dear friend, don't you know that you can feed your chickens on Coulson's Chick Feed and it won't cost you a cent more and that in Coulson's Chick Feed there is a variety of 20 different kinds of grains, seeds, meals and containing everything not only to fully nourish the chicks and make them grow to be big, healthy fellows, but also contains articles that will check and prevent bowel trouble and other fatal diseases.

We are just in receipt of a letter from a poultryman in Windsor who says that he raised 550 chicks on Coulson's Chick Food and at the age of 2 months he sold the broilers for $3 a dozen on the place.

We have White Minorca chicks ourselves that are only 6 weeks old and weigh about 2 pounds apiece.

In conclusion, will say that for your benefit as well as ours we hope that you will raise all your chicks this year by feeding them Coulson's Chick Food.

It your feed dealer hasn't got it, send to us for it.

THE FEED
FOR
Little Chicks

$25 in Gold

We want pictures of chicks and hens that have been fed on Coulson's Poultry Foods and we offer $10 IN GOLD for the best picture of little chicks fed on Coulson's Chick Food.

$5 IN GOLD for the second best picture of little chicks.

$5 IN GOLD for the best picture of hens or poultry that are fed on Coulson's Food.

$1 each for the next 5 best pictures of poultry.

A package of KALE SEED free to everyone who answers this advertisement.

SOME HOMELY CONTRIVANCES FOR THE POULTRY YARD.

IN THIS ISSUE: Decay of Citrus Fruit in Storage and in Transit; Successful Spraying; Cover Crops; Melons Mixing; Cow Peas in Walnut Groves; Eucalypts for Timber; The Largest Trees; Dairy Bulls; About Feeding Poultry; Interviews with Poultry People.

CIRCULATION EXCEEDING 10,000

MIDLAND POULTRY FOOD

Will make your fowls moult in one-half the time, which means they will lay that much sooner. "Laying fowls are paying fowls." You will not be disappointed at the results you get from feeding Midland Feed.

No. 4, Egg and Feather Producing Food

Is what you should feed your hens now, and the results you get will surprise you, for we know it will prove a paying investment. Our book, "The Science of Poultry Feeding," will tell you more about this feed. Send for it. It is FREE. Also

No. 1, Nursery Chick Food
No. 2, Growing Chick Food

We will be pleased to give you further information about this feed if you wish it. WRITE FOR PRICES.

The Only Reliable Balanced Ration for Poultry in the World.

These special foods are composed of the very best materials obtainable and as carefully and accurately mixed as it is possible to make them. They are a COMPLETE FOOD and will produce specific results, each for its purpose, and no other. We want you to become an established customer of ours. We want your trade, be it little or much. There is only one way we can secure it and that is by sending you material that will do what we claim for it.

The Midland Feed will cost you very little more than any good grain you now feed, and no more than you now expend for all the extras you must use in addition to your grain, and the results will be so far in excess of any previous experience you have had that you will readily acknowledge its value. What the poultry man must be able to count on to a certainty is RESULTS.

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXII—No. 10 LOS ANGELES, CAL., FRIDAY, MARCH 4, 1904 Subscription $1 a Year

SHORT INTERVIEWS WITH CALIFORNIA POULTRY PEOPLE...

If there ever was a year in which interest in poultry as a means of livelihood was increasing it is certainly this one. On all sides the worth of the thrifty hen is more realized and we believe the increase will be far in excess of any other year. Feed was never higher, but at the same time the price of eggs and of dressed poultry has been on a much higher average than usual. This high price and the keen demand has induced the importations of large quantities of both live and dressed poultry and eggs from the Middle West. And still prices are up. All say that the poultry business can not be overdone and it certainly looks it, for the demand is ever increasing.

One small community of this State—Petaluma—last year produced almost three and a half million dozen eggs and 32,535 dozen market poultry. Three and a half million dozen is too big a number to fully appreciate, so we reduce to carloads and train loads to better grasp it. It would make, approximately, 300 carloads, or twenty long train loads of eggs. That's only one small community, thirty miles north of San Francisco. Its the biggest poultry section in the world, yet there are many others over the State which are fully as well adapted to poultry raising.

It has been the pleasure of the writer to visit Petaluma several times during the past year and each time the thrift and prosperity of the town and surrounding country are more apparent. We believe this will ever increase.

Nor is Petaluma all. San Jose, Santa Barbara, Fresno, Los Angeles, San Diego—the whole State can show some magnificent stock.

Within the past few days we have seen many prosperous little ranches about Los Angeles. That of G. I. Lytle, for instance, is a model. Ten acres, some three or four miles south of Los Angeles, two thousand fowls, four standard breeds,—Single Comb White Leghorns, White Wyandottes, Black Minorcas and Barred Rocks. The ten acres is proving too small and Mr. Lytle is now looking for larger quarters. He maintains that each fowl should have at least 200 square feet range and the generous runs with the always healthy poultry, shows the reason for his belief. The runs are so large, in fact, that alfalfa is constantly growing over the yard and more rapidly than the poultry can eat it down. Mr. Lytle started in the poultry business in Los Angeles some five or six years ago and has built up a magnificent business.

At first it was along commercial lines, but now is almost entirely devoted to production of eggs for hatching and thorough-bred poultry. The income is now running about $500 per month.

Hatching is mostly by incubators, though not entirely so. Two incubators are running constantly. When the natural method is followed, a convenient and inexpensive little pen and coop is provided for the mother hen, and she is permitted to go and come as she pleases.

In feeding the simplest methods are followed. The balanced ration is secured by change in diet of various grains. Whole grain is fed almost entirely. The feed on Sunday is wheat; Monday corn; Tuesday, wheat; Wednesday rolled barley; Thursday wheat; Friday corn, and Saturday oats. That is the ration for the layers and requires about a sack of grain a day. No mash is fed but beef scraps, bone and grit are before the hens all the time. The principal diet of the young chicks is skim milk and whole wheat.

Another ranch visited was that of Packard & Ingalls at Pasadena. The production there is purely along commercial lines. Broilers and eggs for family trade. Six thousand to 9000 chicks are hatched annually and the incubators are running about eleven months every year. Private families of Pasadena take all the output of the ranch. The eggs are sold at five cents above market and delivered in boxes containing one or two dozen eggs with date stamped on each egg. The broilers are sold at 50 cents each and are grown to one and a half or two pounds each. There is also a limited trade in "squab broilers," a little half pounder, nicely dressed and more as a delicacy for invalids, also sold at 50 cents each. There are many wealthy families in Pasadena which are liberal buyers of the finest and it is that trade which Packard & Ingalls cater to, one family alone often incurring a monthly bill of $95.

Mr. Ingalls informed us that the Single Comb White Leghorns were depended upon for eggs through the season and Barred Rocks and Langshans are used to supply winter eggs when Leghorns are shy with their laying. No cocks are admitted to the yards which supply the bulk of the market eggs. No hens are used in breeding yards under two years of age. There are about 1000 laying hens.

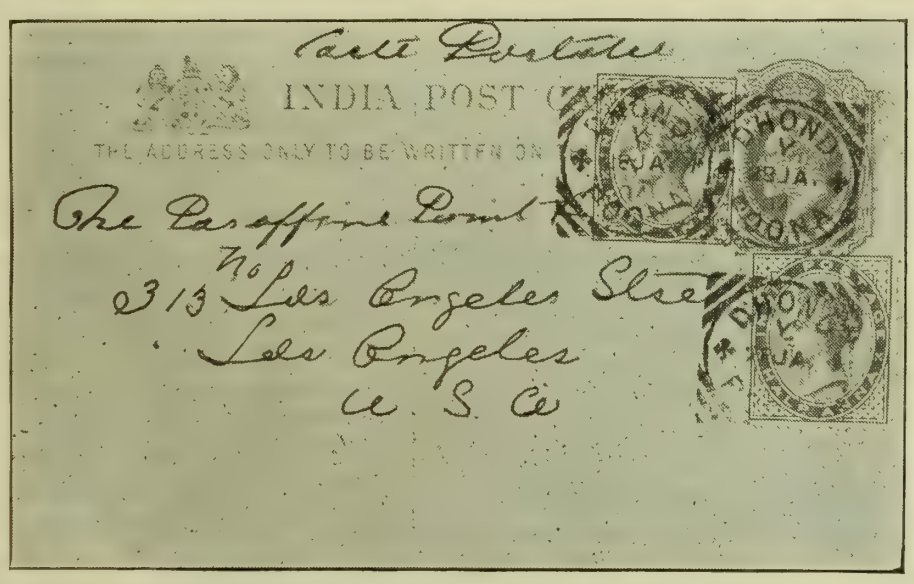
Some caponizing is done and has proved profitable. More will be done later. Capons command 40 cents per pound and a Barred Rock capon will easily reach ten to thirteen pounds.

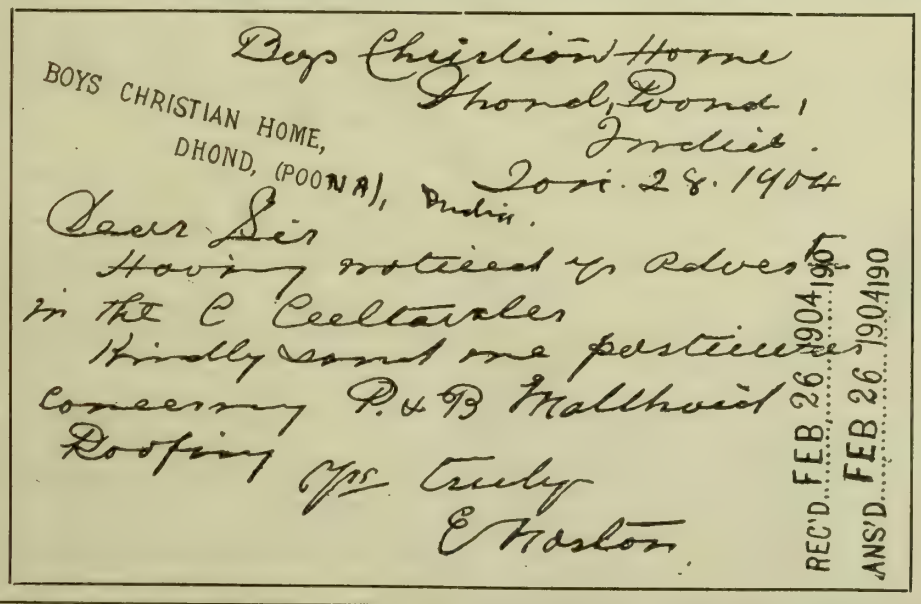
The saving of the wastes are quite a source of profit. For instance, the droppings are always carefully cleaned up, dried, sacked and sold at Los Angeles fertilizer factories at $10 per ton, the monthly income from this source alone amounting to about $10. The feathers are all dried and readily sold at 5 cents per pound. This shows that the poultryman is one ahead of the pork packer, for of his thrift it is said every bit of the hog but the tail and the squeal is saved, while the poultryman saves all but the crow. Some growers of young stock even save that, and use it when referring to their own breed.

Near the ranch is that of J. L. Harrison, of the Lake Avenue poultry yards. Mr. Harrison is just getting established in his present quarters, only having been on the grounds about a year. The cozy home cottage, with neat grounds, is flanked by the garden where kale, Swiss chard and others greens for poultry are grown, while in the rear are well built yards and houses for the poultry. The houses are 5x16, with shed roof, partition, either side of which is room for a dozen hens. The economical building is a factor. Mr. Harrison purchased inch lumber, which he had resawed, leaving it nearly half inch thick. The resawing cost

(Continued on Page 232.)

The Cultivator is Read Everywhere...





Does the Cultivator get results for its advertisers?

Does it circulate in a wide enough territory and to an extent to justify paying good rates for space in its columns?

Recently Mr. Harry McIntire, the Buff Cochin breeder of San Diego, wrote us that "The Cultivator beats all mediums in California for my business."

But that's near home, of course, and most of his customers are in California.

But a few days since a Los Angeles advertiser received a card from Dhond, Poona, India. Now, the Cultivator was aware that it was reaching India, also that it has subscribers in Japan, South Africa, England, Mexico, Australia and many of the islands of the Pacific, but that advertisers get returns from those distances has never been used as an argument with its patrons.

But recently Mr. Judah of the Paraffine Paint Co., Los Angeles, showed us a postal card, an illustration of which appears alongside.

The P & B. Malthoid Roofing has had its fame extended by several years' use of the Cultivator and its popularity is justly increasing, but this inquiry from Mr. Norton, one of our subscribers, is the first from far-off India.

Moral — If you want the merit of your wares to be known world wide—but the keen business man who knows the Cultivator, needs no moral

GIVE YOUR NAMES.

There are questions submitted to the Cultivator for answer from Anderson, Los Gatos, Rocklin and Elsinore, but in each case no name is attached. Let it be understood that no attention is paid to questions where no name is signed. The full name must be given, not for publication, but as a guarantee of good faith.—Editor.

JERSEY BREEDER'S MEETING.

The annual meeting of the Jersey Breeder's Association of Southern California will be held at Buena Park on the 8th and 9th of March. The first day will be devoted to business and the second day to program and discussions. A full attendance of all members is desired as the meeting will be of unusual interest.

ITEMS OF INTEREST.

The Pendulum Still Swings—Among the many indications pointing to a prosperous year for California is the manifest activity in railroad building. Great corporations are the pendulums of commerce and business. When the country prospers this prosperity is evinced in the progressive movement of the railroads. When times are close and money is locked up in vaults we do not read of much railroad expansion. In this State one great line, the Santa Fe, has been purchasing roads in Humboldt and adjoining counties to seek an outlet to the coast. It is announced that construction on the Salt Lake and Los Angeles road will begin soon and be vigorously pushed to completion. The Western Pacific has laid out much work of an important character. The Sacramento Union announces " a further extension of the California North-western, by which route it is held the Southern Pacific will eventually reach Humboldt." Other important construction is talked of, and the indications are good all along the line for a notable railroad-building year in this State. This alone is indicative of enterprise and prosperous times. There may be pinch of conditions in the eastern States, but the Pacific seaboard knows not of them and won't during the year 1904 at least.

* * *

In line with the improvement and extension of transportation companies in this State, noted above, is the development of the irrigation industry—if it may be so designated. From all parts of Southern California come reports of decided improvements in irrigation plants already in operation, and the development of districts heretofore without this essential condition. The Chino Champion, for example, notes the conservation and economic distribution of water by the use of cement pipe lines, where heretofore water was unevenly distributed and much of it lost in effect from lack of distribution pipes. Now farmers are laying their pipes in all directions and greatly improving existing plants as well as developing new ones.

It goes without saying, that this will vastly augment the value of these lands as well as add to their productive power, for in a country where water is king, as it is in California, every inch saved is hundreds of dollars gained in the wealth of the State.

* * *

Colonizing Montana.—Word comes from Montana that a number of the late Boer commanders, among them Gen. J. D. Joubert and Capt. W. A. O'Donnell, have been looking over various sections of that State with a view to finding an easily irrigated location where a large Boer colony can be established. The Boers desire to homestead upon government land which can either be irrigated by their own cooperative canal building, or else will come in under the government irrigation work projected in Montana. They have expressed themselves as amazed at the opportunities afforded by the rich valleys of Montana for their people, and it is stated that they will recommend the State to their compatriots.

* * *

Protecting Shade Trees.—We all know, and some of us to our mutual anguish, the vandalism wrought by companies using wires to convey currents of electricity. We know, too, what the measure of damages is to those whose trees are ruined. To remedy this condition, to save the trees from disfigurement and often ruin, Dr. S. M. Woodbridge, an authority on shade trees, and their culture, makes the following suggestions, whereby no electric company could be put to much, if any, extra expense and whereby the shade trees would be preserved in their natural beauty and full usefulness.

"If small poles (say 35 feet high, at a cost of about $4.50 each, instead of poles 60 feet high, at a cost of about $14.00 each) were placed on each side of the street, opposite each other and connected by cross wires in the same manner as trolley poles are now connected, and if on these cross wires were carried the electric light, power, telegraph and telephone wires, the same as trolley wires are now carried, the shade trees could be preserved and the hideous sight of big poles with their more hideous cross-bars avoided.

Along city street and country roads where trolley cars run, the companies operating them should be compelled, for a consideration, to carry on their cross wires all other electric wires, thus saving a multiplicity of poles that disfigure our streets and roads.

* * *

Wide Spread Importance.—One of the most far reaching decisons handed down by the Supreme Court of this State for years, is the one recently announced wherein the owner of an artesian well sought to enjoin a neighbor from operating wells for the purpose of supplying water to a distant tract by which the flow of the first well was stopped. The court held that the diversion and sale of the underground water was an injury to the plaintiff which the courts would prevent and this decision has been reaffirmed after another hearing.

So great is the import of this ruling that the principle on which the court announced its decision should be well understood, to the end that the doctrine now well settled may not be misunderstood in future, nor misapplied by those who have thought it within the province of law to divert water from its proper channel to the injury of dependent parties.

"The general principle laid down by this ruling is one of great importance, not only to California," says the Irrigation Age, "but to all countries where artesian wells are used for irrigation." This decision abandons the common law doctrine that the owner of land has an absolute right to all the waters lying underneath it, to dispose of them as he pleases without regard to the rights of adjoining property owners. The point of the decision is that a land owner who has used percolating waters upon his land has paramount rights to those of a subsequent appropriator who takes the water to distant lands.

It will be observed also that the holding of the court is important in another point. A land owner who is using artesian or underground waters will not be permitted to stop the flow of his wells by drawing off the water for sale. If he is using the water for irrigation, he is not entitled to a larger quantity than is necessary for his own use.

Mr. Justice Shaw, who delivered the opinion for the bench, settles another point in water right contention, viz.: that "might is not right," nor ability to destroy the property of another immune from legal reparation. In brief, the doctrine so well laid down and so thoroughly expounded will for all time protect the right of a land owner to the uninterrupted use of the waters under his own land for the purpose of making that land productive and will not allow an avaricious neighbor at a distance to deprive him of it. The sound logic and hard common sense contained in this ruling will be commended by honest men everywhere.

To Get Reliable Work Hands.—In a preceding article the Cultivator mentioned some of the causes which lead to the scarcity of reliable farm help, especially in the Pacific States. It was mentioned that the full measure of compensation did not wholly lie in the wages paid, but also in the provisions made for the comfort and well being of the employe.

The climatic conditions here tend to perpetuate the customs of the earlier pioneer days, when but little attention was paid to the wants of the farm hand, because it was thought that he could look out for himself as easily as could the miner, the sheep herder or the cow boy. It should, however, be borne in mind that the change in conditions have increased the needs of all of us. In the matter of creature comforts one person needs about as much as another, no matter whether these needs are real or artificial. A clean place to eat, a warm place to sleep, however simple and plain it may be, should be provided. The promotion of personal comfort begets a feeling of personal respect. A man who has a decent respect for himself is apt to have something of that kind for others. A considerate attitude towards one's employes is pretty sure to awaken in their minds an interest in the work they have in hand. They will heed admonition more readily, comply with requests with better grace and perform their tasks more efficiently. Tactfulness as well as principle should be employed in the management of men. The more intelligent a man is, the quicker will he perceive and respond to any show of consideration for him by the foreman or employer. Others of less intelligence are apt to follow by example. The day for the treatment of farm hands as a boat mate treats the stevedore, or in the abusive manner of the gang boss toward the hoboes on railroad or other common labor, has gone by. The incitement to self respect, the encouragement of sobriety, the provisions for personal comfort and the recognition of efficiency, will all tend to promote reliability and content, and, further, to inspire a proper ambition on the part of the farm hand to become settled. Might not such a show of consideration serve to increase the numbers and efficiency of good farm laborers from the East, and to lessen the demand for Chinese and peon field hands? By the exercise of proper tact and rational methods, it would seem that the standard of American farm help on the Pacific slope could be raised to a more satisfactory plane.

The Chicago Packer says on Februarry 27: An auction company for the handling of California citrus fruits has been organized by the members of the St. Louis Fruit & Produce exchange and the new concern is expected to be in readiness for the transaction of business soon. The new concern, which is to be known as the American Central Fruit & Produce Auction Co., has practically arranged to handle the products of the California Fruit agency and will thus do away with the proposed auction company that the California fruit people were contemplating establishing in this market.

AUSTRALIAN AND ITALIAN RYE GRASSES.

In a recent number of the Cultivator the request was made to give the difference between Australian and Italian rye grasses. A subscriber from Arcata, who has had experience with these grasses, makes the following answer:

The Australian rye is a shorter and finer grass than the Italian rye, and is perennial, making a very good permanent pasture, but does not produce the amount of hay. The Italian produces abundantly for two years, then dies. Our native rye or cheat, combines the virtues of both grasses and cannot be distinguished from the Italian rye. It is a perennial, and a persistent and abundant grower, making the best of pasture and hay.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

COMMISSION BUSINESS WANING.

For years the Cultivator has discussed the fruit commission business from the premises that, as at present conducted it is not altogether beneficial to the producer and hence the existence of this means of handling perishable products is a legitimate subject of discussion as to its continued encouragement. This journal has not held that the failure of commission merchandizing is chargeable altogether to the inefficiency or dishonesty of the individuals engaging in it but rather that commission dealing as practiced and as can only be conducted is founded upon incorrect business principles if not upon fundamentally impossible plans. In this view we have lately been reinforced by an article written by J. S. Crutchfield, himself a prominent commission dealer of Pittsburg. Mr. Crutchfield bases his paper upon the assumption that the commission business is on the wane. He begins by asking, "Is the exclusive commission man now extinct?" He says a large majority of the members of the National League of Commission Merchants are both commission men and dealers and that they are compelled to speculate in the same lines of fruits they handle on commission. Those readers of the Cultivator who are following the trend of the work of fruit marketing this strenuous season should fix this proposition in their minds, turn it over occasionally and see what the fruit grower would be up against were his own marketing organization wiped out of existence.

"It never was, nor is it today," says Mr. Crutchfield, "a small matter to ask the farmer who toils incessantly, to entrust the fruit of his labor into the hands of a commission man, hundreds or thousands of miles away, where he has no security aside from the reputation of the said commission man, that he shall receive full and honest returns, or in fact anything from the sale of his property. The very existence of the producer and his family is at stake against what most people think is merely the reputation of the commission man."

"God has decreed" continues the article, "that whatsoever a man soweth that shall he reap, and the inference might be drawn that the commission men, whose business is on the wane, are only reaping what they individually have sown. Such is not always the case, but that unfair dealings with the producer by many commission men have been an important contributary cause of the general decrease of commission business no one will deny."

Such words as these should sink deep into the understanding of the co-operators now known as the California Fruit Agency. First, the commission dealers are also speculating merchants; second, the commission system is so handicapped by doubtful methods of procedure as to call for an emphatic protest from a member of the National League of Commission Merchants before a meeting of that conservative body. In the face of this testimony, and the experience of ten years ago, how can anyone with the lasting interests of our fruit growers in view, advocate disorganization or even any change in the present system of marketing that does not contemplate the holding together of the growers intact? Some people who still believe in f. o. b. sales think the spot cash buyer should be allowed to figure in the situation. Where is he? Who is he? What are his methods when he does operate? Mr. Crutchfield says he is often moneyless—this "spot cash buyer." Often under his buying plan he causes the producer to issue a sight draft upon the said cash buyer (himself) "which no bank in the country will take for fifty, twenty-five or even ten cents on the dollar." Thus will disappear upon trial all the old, discredited methods of handling the citrus fruits of the States.

CITRUS FRUITS

DECAY OF CITRUS FRUITS IN STORAGE—IN TRANSIT.

The following exerpts from a paper read before the Pasadena Farmers' club, last week, by T. J. Ashby, manager of the Pasadena Lemon Growers' Association, will be found of interest to the citrus readers of the Cultivator. After noting at length the many methods used by nature in forming, maturing and disseminating seed, the writer says:

"It should be needless to point out to a thinking mind after seeing the intelligent process of forming," to say that a plucked fruit has still within it the elements of life, and that its natural bent is to continue maturing until further effort is hopeless. The early cut grain matures its seed after the disaster of cutting, the pulled weed matures its seed, as we note, while we collect it for burning. The forehanded and observant farmer gathers his seed corn early, for he knows such seed germinates sooner and stronger than the ripened corn, subsequently gathered, that has put its energy into the further formation of starch, and so our fruit after gathering, goes on ripening its substance, and maturing its seeds.

As it is our object to restrain this maturing, the Italian method of gathering fruit, especially lemons, with some four inches of stem or twig, is a scientific method, and life within the fruit will be longer preserved. When this life tendency is exhausted, or by rude handling, destroyed, decay follows, that is, chemical disintegration follows death.

This to the grower means loss, but to the by-product manufacturer or distiller who takes up this disintegration of substances, it means gain. They utilize the various ferments developed and convert them into commercial enterprise, be it wine, alcohol or vinegar. Where we attempt to preserve the life they purposely destroy it, and then by hydrostatic and thermal conditions ripen the pulp and engender yeast germs and ferments. Even here nature's methods of balance are clearly defined, for if enough saccharine matter, such as dextrine, glucose or other sugar formatives are in the substance, enough alcohol is formed to be a self-preservative, but if lacking, oxygenation sets in and the substances must be bottled or allowed to turn into vinegar.

It is still true that we need not expect good fruit from an unhealthy tree, or poor fruit from a healthy one. So the first need of a healthy tree is to have a healthy, intelligent friend who will care for its needs, study its beautiful system of development and keep it up to its best. The best demands the local application intelligently applied of the best methods of irrigation, fertilization, destruction of insect pests and of cultivation so that indeed it may appear "as a tree standing by the rivers of water, bringing forth its fruit in due season."

The best keeping fruit is the one that has a regularity of development, whose cells are of uniform formation. Alternate times of plenty and starvation, irrigation and drouth, may form the countryman's ideal of fat and lean in bacon, but it will spoil the keeping qualities of a fruit. Steadiness of purpose is a tree's ideal.

Once in the warehouse, brought with the least jar, the cleaning should be done at once, as the fruit with relaxed pores from wilting, will not resist moisture. The various degrees of maturity should be graded to themselves, and any chilled or frosted fruit disposed of at once. Concerning the appliances for cleaning, gently tap an orange or lemon with a brush and the pungent odor of escaping oil will tell at once if it is damaged. Such a fruit, or one abraised or knocked against the edge of a picking box, placed under a bell glass with moisture, and set in a warm place, will soon decay. So watch the results of brushing.

Of the warehouse applinaces, the foot press for holding the lid on a packed box when nailing, is, under a careless manipulator, a great cause of decay. You may often see, when a car is being loaded, several oranges or lemons with papers torn, and a bruised surface where the edge of the box or lid has crushed it. The Italians will have none of it, they carefully use knee and hand, carefully pressing the bending boards on the bulging fruit so that none are bruised by nailing down lids.

The only mechanical chances of damage from a foreign shipment is when the boxes are slung together by ropes and lowered into the steamer's hold. Our own steamers use the same method and is destructive and other methods should be enforced. In the loading of cars, if the advice of the S. C. F. Ex. were carried out in lining the car with heavy paper and raising the boxes from the floor with car strips, the frequent loss of "frozen in transit" would be greatly reduced or avoided.

In speaking of mechanical difficulties, one might add the long time in transit; this, however, is more of a moral difficulty, for the trouble is largely in the transportation department wanting to make a good showing, as slow time means economy of power, so they put a financial gain against the growers' heaviest damage by decay. Eight cars, going to Cleveland, Ohio, during the past year, took seventeen to twenty-three days with an average of nineteen. Ten more days would be the average time from San Francisco to Australia, our natural outlet for winter lemons (our winter being their summer) and a steamer the natural competitor to correct railroad apathy.

* * *

First, a cleanly warehouse and cleanly cars. In apple packing, the second or third season is often a veritable calamity of decay, if fumigation of buildings is not accomplished. And it must be the same with the orange and lemon.

Secondly, a complete system of ventilation, carrying away the gases of decomposition, carry away excess of moisture, use the hydrometer more than the thermometer. It is in humidity that the danger lies, dry warm air will cause shrinkage, but not decay, in undamaged fruit. In sterilizing our cars and packed fruits we have tried formaldeheyde with marked success when used with steam. Unfortunately we turned to simpler methods, evaporating from sheets or making the vapor direct from wood alcohol, with little result. Eight or ten ounces of formaldehyde with some sixteen ounces of water, simmered on a gas stove, will in three hours penetrate completely through the packed boxes in a car, and without damage sterlize the wrapping paper, and we believe the spores. It cannot, however, stay chemical decomposition within old fruit. The four cars so treated held up in better condition than those untreated.

We are now experimenting with wrapped and unwrapped fruit, and with loose fruit in different packages treated and untreated with formaldehyde and steam and look for important results.

Our summary of methods best suited to eliminate decay from citrus fruits would be:

Orchard methods to induce uniform development from blossom to picking.

Picking methods that give the least possible jar, punctures or abrasions.

Warehouse methods that maintained intact the delicate rind, allowed the right evaporation, the least precipitation of moisture, the right thermal condition and conserve to the longest period the lingering life of the fruit.

Transportation methods in the best cars suited for refrigeration, methods that did not transgress on the rights of the people they serve, or trample on the intent of the contracts for charges based on rapid transportation of perishable freight, and,

Lastly, selling methods that would bring the grower closer to the consumer and give the greatest number the advantage and opportunity to sell right and buy right."

GRAFTING PERSIMMONS.

A local fruit grower has asked us how to graft persimmon trees, he never having had any success, either in grafting or transplanting. Persimmon trees are easily grafted, the process being similar to that employed in grafting other trees. Young seedlings are better grafted just below the surface of the ground. Split the stump and insert the scion so that the inner barks will match. It is better to tilt the scion slightly after the barks are as nearly matched as possible, thus insuring a perfect match at some point. Wrap with waxed string or cloth and mound up to the top bud with dirt. After the scion is growing nicely, remove the waxed binding and press the soil firmly around the top of the stump.

It is important to keep the roots of all trees from drying while transplanting them. Persimmons are no exception. If they die after careful handling it must be a case of predestination.

"ITS PENNY WISE"
Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it, when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 450 Santa Fe ave., Los Angeles.

Citrus Stock

It has rained and now is the time to send in your orders. We have a first-class stock of Navels, Navelencias, Valencia Lates.

All Stock two years old on four-year-old roots. Large, healthy, clean.

LAND AND WATER

BY A. J. MCCLATCHIE, PHOENIX, ARIZ.

EUCALYPTS FOR TIMBER.

A Chicago correspondent writes concerning the planting of nineteen acres to Eucalypts in sandy soil along a river near Orange, and asks whether it would be advisable to plant Blue Gums, Red Gums, or Sugar Gums.

A Los Angeles correspondent writes that he intends setting to Eucalypts 120 to 320 acres in the El Cajon valley, about fifteen miles from the ocean, part of it the bed of the San Diego river. He describes the soil of the low land as a sedimentary silt composed chiefly of sand, vegetable mould, decomposed granite, and disintegrated volcanic matter, the water rising to within ten to eighteen feet of the surface. The higher lands are twenty to fifty feet above the water line, part a red clay soil, and part a chocolate adobe. The climate he describes as very equable, light frosts sometimes occurring in the lower levels. He asks the following questions:

1. What kind or kinds of Eucalypts would you recommend; at what age would each species be marketable (if thoroughly and properly cared for) and for what purpose?

2. Which of the above described soils is best for the species you advise?

3. At what age would Blue Gum probably reach the size of standard piles, viz: twelve inches in diameter at butt, and eight inches forty feet from butt, there being trees of this species on this land, reliably stated to have been planted seven years ago that are thirty-four inches in circumference three feet above the ground?

4. What species would you think likely to bring the best returns in ten or twelve years?

5. How far apart should the different species be planted? Is six by eight feet too close, if every second row is cut out when they begin to crowd?

6. Where can I get the best seed?

* * *

Besides the Blue Gum, which has been planted in such a variety of situations, there are at least two Eucalypts that have proven to be adapted to Southern California that can be recommended for timber culture in low lying situations, and at least two that for similar reasons can be recommended for higher situations.

Eucalyptus rostrata and E. citriodora are naturally adapted to warm, moist situations, the former enduring temperatures as low as 20 to 24 degrees in winter, and the latter being injured by temperatures much below 30. E. corynocalyx and E. tereticornis are especialy adapted to dry situations, the former enduring temperatures of 24 to 26 degrees, and the latter surviving when the mercury falls to 16 to 20 degrees.

The Blue Gum ordinarily attains a large enough size to be cut for fuel and for oil within six years; and large enough for piles in ten or twelve years if not planted too close. E. rostrata reaches a large enough size for fence posts in five or six years, for railway ties and for telephone poles in eight to twelve years, and for lumber in twenty to twenty-five years. E. citriodora becomes large enough for material for agricultural implements in ten years, for telephone poles in ten to fifteen years, for material for carriages in fifteen to twenty years, and for lumber for inside use in houses in twenty to thirty years. E. corynocalyx becomes large enough for fence posts in four to six years, for railway ties and telephone poles in eight to ten years, and for lumber in twenty to twenty-five years. E. tereticornis becomes large enough for fence posts in four or five years, for railway ties and telephone poles in eight to ten years, and for lumber in twenty to thirty years. On the lower levels E. rostrata might be expected to bring the best returns in ten or twelve years, and on the higher levels E. tereticornis. It is difficult to safely give an opinion, however, so much depends on circumstances.

The distance the different species should be planted depends somewhat upon the use that it is intended to make of them. If intended for fuel or fence posts, they may be planted closer than if intended for other purposes; and if intended for lumber, they should be further apart, finally, at least, than if they are to be cut for ties or telephone poles. If for fence posts, E. rostrata, E. teriticornis, and E. corynocalyx may be planted six by six or six by eight; if for telephone poles, these species and E. citriodora should not be planted closer than ten by ten; or they may be set six by eight, and each alternate row cut out for posts or fuel, leaving them eight by twelve. For piles E. globulus should be set, or should be cut out to, twelve by twelve. For lumber E. citriodora should be set as far apart as twelve by twelve, and the faster growing species should be at least twelve by sixteen, finally. It is a mistake to set too close. Nothing is gained by it. Eucalypts like sunshine, and should not shade one another too much. An acre of land can produce only a certain amount of timber. For most purposes it is better that this timber be concentrated in a smaller number of vigorous trees, than distributed among a large number of crowded ones.

The best source of reliable seed are the trees growing in the region—trees whose identity and characteristics are established. Purchasing seed in Australia is likely to result in many disappointments. Before there were trees of seed-producing age in the southwest it was necessary to import seed, but now that there are large trees of most of the desirable species growing in California, the importation of seed is in most cases unnecessary. Of a few species we will need to procure the seed from Australia for some time yet, but of most of them there is an adequate supply at home.

* * *

TOMATOES IN HOT DRY REGIONS.

T. S. V. writes from Daggett asking for the name of the variety of tomatoes that bears here during the summer. The only varieties that bear well in a hot dry region are those with very heavy foliage, the Dwarf Champion being the tomato that is grown here almost exclusively. It begins ripening fruit during the latter part of June, and continues furnishing fruit through July and much of August. During the latter month no fruit sets, and consequently none ripens during September. Fruit begins ripening again during October and continues until the frosts of November or December. The varieties with sparse or finely divided foliage produce little fruit during any part of the season.

NURSERY

W. HERBERT SAMSON, PROP.

We have for sale all leading varieties of Deciduous Fruit Trees

OUR SPECIALTY:

Lob Ingir or Genuine Smyrna Fig of Commerce

A WORD ABOUT FIGS: We sell the genuine Fig of Commerce. Our cuttings came from bearing trees in the orchard of the Stanford estate, near Vina, and the fruit from these trees, after being examined by the best fig experts of the State, is pronounced the genuine Fig of Commerce, the Lob Ingir. Dr. Eisen says this and no other variety should be known as Smyrna, if the name Smyrna is to be used at all. We can refer prospective purchasers to the Supt. of the Stanford ranch, at Vina, for a verification of this statement. As to my own reliability, I can refer parties to any of the leading merchants of Corning, and to the Bank of Tehama County, and the Herbert Kraft Co. Bank, at Red Bluff, Cal. No one in the Unites States originated the Commercial Smyrna Fig. It is a variety which has been grown in Asia Minor for thousands of years. Parties may originate a fancy name and copyright it, but this does not make the fig they sell under a copyrighted name, any better. The fig we sell does not require a high sounding name to make it appear as the only commercial fig. All that we claim for our fig is that it is known as the Lob Ingir, the cuttings of which came originally from the famous orchards of Smyrna, Asia Minor, and is of the variety so largely imported into the United States in the dried state. We are not charging you for a private copyrighted name, but we sell you good 2 to 4 foot trees of the Genuine Smyrna Fig of Commerce at $150 per M. To fully demonstrate the methods used by some nurserymen in giving old varieties of fruit trees a new name and thereby make it appear that they have the only genuine article, we will say, how ridiculous it would be if we copyrighted a name like "Muro" and sold the old variety of Muir Peach under this name. Do not be misled by copyrighted names. We have the genuine Smyrna Fig of Commerce and if you want to confirm our statement, we do not hesitate to refer you to the above named parties. We can supply prospective planters a small sample of our dried figs for comparison with the so-called copyrighted figs. We also have for sale all varieties of Capri Fig trees, and all of our customers will be supplied at the proper time with a colony of Fig Wasps, free of cost. Address

BY J. W. MILLS, ONTARIO, CAL.

COWPEAS IN WALNUT GROVES.

Editor Cultivator: What is your advice relative to planting Black-eyed Field Peas for forage and soiling as well as for green manuring? I have a nine year old walnut grove on good bottom soil with abundance of irrigating water until June and have seriously considered planting some field pea—preferably Canadian, but cannot get seed—notwithstanding the lateness of the season and pasturing same off about April 20th, when I would plow again. If I keep the ground saturated do you think that the lack of cultivation during those two months of spring will affect the trees? Would 100 pounds of Black-eyed peas per acre be an excessive quantity to broadcast. I intended to broadcast and then disk twice about four or five inches deep, lapping the disker and then harrow.—L. J. U., Pala, Cal.

Your plan is a good one, having so much irrigation water, but this is too early to plant the Black-eyed pea. We infer that you refer to the cow pea, which is really a bean and will not stand any frost at all. It requires very warm weather in which to grow. If planted this early even in your section it would not, according to our judgment, give as good results as if planted later: plant at the time you find your garden beans do the best. It will take about two months for them to make a growth that would be of much use to you. If you broadcast (75 lbs. per acre is enough seed to put on) and furrow out with small shovels on a cultivator, you may keep the orchard well watered and keep the peas growing. If you plow under the crop or the vines that are left after pasturing them, your soil will improve rapidly, even though it appears to be in good condition now. You need not fear any damage resulting from growing these crops and plowing them under at the time you mention. The time selected for doing this in California has always been early spring because it was thought necessary to have clean culture from that time on. When water is abundant, a much better growth is secured on the green crops if grown in the spring or early summer. At this time the soil gives up its food to plants more rapidly than any other time of the year and consequently produces a more abundant growth. We do not know but what spring and summers are better seasons for growing green manuring crops than winter. Prof. Powell believes that it is better to grow a summer crop, let it lie dead on the ground during the winter and plow under in the spring than to allow the ground to remain bare all winter to be washed by the rains. He speaks from an eastern standpoint but suggests that it migth work well here provided there is water enough available to grow the summer crop and keep the trees sufficiently supplied with moisture.

You should not overlook the fact that if you never have grown these peas on your land, you may not get good results unless you inoculate the seed with earth in which cowpeas have grown before and produced nodules on the roots. If you moisten the seed and sprinkle them with earth, you should get good results. Even if you should get a good growth without nodules you would not gain any more than by growing a grain crop as far as fertilizing results go.

* * *

OLIVES AND SHADE TREES.

Editor Cultivator: What is the best variety of olive to plant, both for hardiness and early bearing. Also a variety of shade tree suitable for making shade with branching limbs.—Subscriber, Pomona.

Any of the olives are hardy growers except Manzanillo Atrovolacea and a few others that are not of much importance. Verdale makes a dwarf tree but is one of the earliest bearers. Rubra is a good grower and bears young. It is a rather small olive but has a fine flavor when pickled. It is a perfect free stone. Santa Caterina is a sure bearer, a vigorous grower and of fine quality. Take it all in all, Mission is considered the best general purpose olive.

The growing impression among people regarding street trees seems to favor the live oak that is a native of this valley. The late Mr. C. L. Gould tried to induce street tree committees and farmers' clubs to use the native live oak as a street tree. The subject was one that he always presented on every occasion when ornamental tree planting came up, and evidence seems to show that he was right. If the object is to have spreading shade trees in the house yard, we would surely either have a fig or a walnut tree. A fig tree would not be pleasant near the house, but for an out-of-the-way corner where the fallen fruit would not drop in the path, it would be the most valuable shade tree that we know of. The English walnut is a clean tree except for a short time in the fall, but the discomfort of having to clean up a few times will be offset by the crop of nuts it will produce. Both of these trees are useful as well as handsome and are as free from pests which will disfigure ornamental plants as any trees that we know of.

* * *

MELONS MIXING.

Editor Cultivator: Will you kindly answer through the Cultivator whether it is safe to plant pumpkins, water melons, canteloupes, etc., near each other? Will watermelons and muskmelons mix if planted near each other, and will different kinds of watermelons mix?—M. C. H., Pasadena.

There are several species of melon fruits that are quite distinct and do not cross pollinate, though they mix among themselves. Pumpkins belong to the division known as Cucurbita pepo. The vegetable marrows belong to this family, though they look quite different, being long, with a more tender skin. The squashes known as summer squash belong to the same family. All of these will cross and become mixed.

Hubbard, Marblehead, Essex hybrid and Turban squashes belong to Cucurbita maxima and will not cross with C. Pepo. They will cross with each other the same as in the case of other species.

Canteloupes will not cross with watermelons or cucumbers.

Watermélons will not cross with any of the above species of melons. The tendency under ordinary circumstances is to deterioration in all of these annuals, and this is often laid to the crossing of different species. Hybrids are sometimes formed which make new varieties but it is very unusual and is even difficult to bring this about artificially. These rare cases make a decided change in the product and does not simply give modified results in an indifferent way. If this were so, we would soon have such a conglomeration of varieties that the distinct species that now exist would soon be obliterated. It would simply render scientific classification a thing of the past.

* * *

GRAPE GRAFT FAILURES.

Editor Cultivator: I have some resistant vines I planted last winter, intending to graft them last summer. Procured a pamphlet from Berkeley Experimental station on grafting and tried to graft them but failed. Now, I want to know whether there is any method of grafting them on while dormant or what is best to do.—W. H. O., Covina.

If you failed to get a stand of vines with your summer grafting, you ought to get a good stand by grafting the failures this spring. We suppose that your vines are planted in vineyard form. When the buds begin to swell, which is some time in March, cut the stocks off about an inch below the surface of the ground and put in a cleft graft. Make the scion with two buds and mound up with dirt so as to bring the top bud just at the surface of the mound. No wrapping is necessary. When the scion starts to grow, stake the young shoots or the wind will be sure to blow them out. When six inches long, remove part of the mound of soil and later level it even with the surface of the ground. Rub off all roots that come out at the bottom of the scions. Be sure not to saw the stump off lower than described as it will be apt to produce roots on the scion which will then make your vine partly non-resistant.

SUCCESSFUL SPRAYING.

In a recent visit I made to the famous orchard of the Arlington Heights estate, managed by Commissioner Pease, of San Bernardino county, I noted the wonderful success he is having with spraying. We all know Commissioner Pease. We know too how greatly he favored fumigation and with what good reason. In his hands it was a wondrous success, though very costly and laborious. I noticed an item in a paper recently to the effect "that the commissioners of San Bernardino county have discovered in some of the citrus orchards a prosperous colony of red scale." It is farther stated that "they have commenced spraying to exterminate this dreaded pest." One of our best inspectors who, himself, is a recent convert to spraying, having sprayed his own orchard, lately advised fumigation for red scale. It seems that Mr. Pease knows of a better way.

The other significant fact comes from the experience of Mr. Mills, who has wrought such wonders in the vast Arlington Heights orchard. Mr. Mills had fumigated, or at least the orchard had been fumigated, three times within eighteen months, yet the scale steadily increased. The expense was 45 cents per tree. This past season the trees were sprayed and with entire success. Mr. Mills showed me the trees and though they are very clean now, they show to the experienced eye that they had been in bad condition. Mr. Mills gives the best record for cheapness of any one that I have yet heard from. It cost him less than one-half cent to put it on. He put 18 to 20 gallons on the large twelve-year-old trees. He owns his own machine and does his own work. He says that the spraying has cost him only one-fourth of what he had to pay for the fumigation. Mr. Mills, however, is as urgent as I am in favor of the man's doing his own work. He says, what must be patent to any thoughtful man, that in this work thoroughness counts for everything. A neighbor had his orchard sprayed, was dissatisfied and came and looked at the Arlington trees. He was so pleased with Mr. Mill's success that he secured his services to spray his own orchard. He feels that the result has more than warranted this expense. I am very glad to note that the orchardists are very generally considering the wisdom of co-operating, purchasing and owning their own machines and spraying their own orchards. Mr. Mills asserts emphatically what I have long believed, that in work where such painstaking care is imperative, it should not be left to disinterested parties. One of the commissioners of San Bernardino county asserted to me not long since with great emphasis, "You are entirely right in urging that the orchardists own their own spraying outfit and do their own work." I think the time is ripe for the statement that fumigation is doomed. Thorough spraying with a good quality of distillate is surely the way to treat the scale, and at the same time destroy the red mite (red spider) and kill myriads of thrips. But in the good future, contract work will be replaced by work done by the orchardist himself. In fact, the difference in the actual cost of spraying and the amount charged by the contractor will very soon pay for the outfit. Of course, Mr. Mills' work is on a very extensive scale. He said to me that his machines were paid for many times over during the past year. If there is any orchardist who has doubts in this matter, it will pay him well to visit the Arlington orchard, where he will see an object lesson that will surely convert him to the value of the distillate spray, very greatly to the advantage of his own pocketbook and orchard.

* * *

COVER CROPS.

I have never talked with a more enthusiastic advocate of green manuring than is Professor George Powell, who has recently paid me a visit. He contends that nothing has so benefitted the orchards of the east as the use of cover crops. He gives startling examples of excessive fruit production through this practice, coupled with good cultivation. He states that his father, whom I know to be one of the most successful apple growers of the east, secured eleven consecutive full crops of apples, which phenomenal fruitage he ascribed almost wholly to cover crops. The crop used by Mr. Powell was crimson clover. I fully believe that the dry years of all times are the very ones when this practice should prevail.

Mr. Mills, of the Arlington orchard spares no pains or money to keep up with the very latest in orchard practice. What wonder, then, that he has laid hold of this practice of cover crops in bringing the Arlington orchard to its present wonderful thrift and productiveness. Last year he plowed under three hundred acres. This year twelve hundred acres are receiving the benefit from a great crop of Canadian field peas. So marked is the advantage that next year Mr. Mills proposes to plant the entire orchard. He rightly contends that the cover crop is not only the cheapest way to get nitrogen and supply the greatly needed humus, but that it is almost as valuable in conserving the moisture of the soil. He states that a part of his orchard which was green manured last year needed only one irrigation the past season, and the balance only two irrigations, though Mr. Mills is insistent that the trees have water whenever they need it. I said, "Can it be possible that the trees kept their thrift with so little irrigation?" He replied, "I will show you," and drove at once to these portions of the orchard in question. I was delighted to see vigorous trees with rich green foliage and loaded with fruit. Surely here is another object lesson that speaks for itself.

SPORE CASES OF BOSTON FERN.

Mr. Geo. F. Herreck, Riverside, sends me a sprig of the common Boston Fern with numerous spore cases on the fronds or leaves. He asks if the eggs or scale are to be feared; and if so, he asks for the name of the pest and asks for the remedy. These spots are the spores of the fern and no enemy at all. He will find that they are regularly arranged on the leaves. From these come the spores or seeds, if we may so speak, of the plants. It is not strange that Mr. H. thought them scale insects, as the semblance is marked. I do not think that scale are ever placed with such regularity. They wander about for a time and then settle to suck and grow. There is no reason why they should be placed with any regularity.

* * *

CORN WORMS.

L. R. Richmond, Hemet, wishes me to explain the origin and history of the caterpillars that feed on the green corn. This is the larva or caterpillar of a moth. The grayish-yellow moth lays her eggs on the silk, and as they hatch the "worms" work down and feed on the growing kernels. Hand picking will protect against them, but this is hardly practical for more than a small patch. A wire screen over the ear has been recommended as it is said to keep the moth from laying, and yet will not prevent pollination. I wonder if this is more than a theory. In any case this is as impracticable as the other. Early or late planting often avoids the pest. This insect also works on the cotton bolls and is called in the south "The Cotton Boll Worm." It also works here and elsewhere on tomatoes. It eats into the fruit. It is a nasty pest, if we may use an expression that our English frineds are wont to employ.

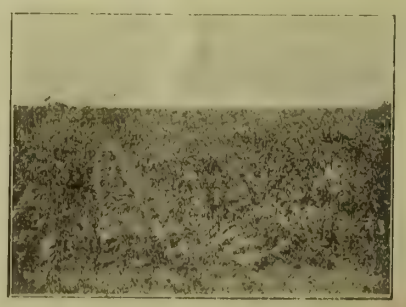
The friends of co-operation in Los Angeles county lost a strong man in the death of John R. Moles, of Pomona. The Times, of this week, makes this strong comment on his death and the loss his services will be to co-operative interests: The progress and advancement of co-operation in this valley, as exemplified in the Citrus Fruit Exchange, owes much to Mr. Moles. He was always an energetic leader. No work was too hard nor detail too tedious for him; he was always ready to do more than his share.

Glendora Citrus Nurseries

Washington Navel, Thompson Improved Navel, Valencia Late and St. Michael Orange Trees, Villa Franka and Eureka Lemon Trees, Dancy and Oonshiu Tangerines, "Nectar" Pomelo. This stock is one-year buds on two-year roots.

1,000,000 Fancy Orange Seed Bed Stock, $5.00 per M.

A good look at our budded trees is sufficient to convince the most particular buyer. Send for prices.



W. G. HALL - GLENDORA, CAL.

Dead Wood

Is more or less prevalent in every orange and lemon grove, i. e., trees that are unprofitable. How many such have you in your orchard? Would it not pay you to put paying trees in their stead? Think it over and then write us about it, giving the number you may require.

Your Home Grounds

Should contain at least a few trees of the better varieties of oranges and lemons: For this purpose we have some exceptionally fine trees to offer, being grown more especially as single specimen trees, rather than for larger plantings. Possibly you would like to plant a few citrus trees about your home this season? If so, will you do us the favor to correspond with us about it?

An Orange and Lemon Booklet

Giving more valuable information about varieties, methods of planting, cultivating and pruning than anything of its kind ever issued will be sent to you cheerfully without cost if you will mention this advertisement. Large contracts solicited. Correspondence a pleasure. May we hear from you soon?

Coast News and Notes

OF INTEREST TO FRUIT GROWERS, STOCKMEN AND AGRICULTURISTS

HORTICULTURE.

The first Arbor Day celebration in Vacaville was held last week.

The Santa Paula Deciduous Fruit Association has been organized for the purpose of preparing for market the fruit of its members, either green, canned or dried. The capital stock of the association is $25,000.

The residents of the new Naglee Park section of San Jose, in which fifty or more fine residences have been erected, have decided to ornament all the streets in the tract with palms of various varieties.

Orchard pruning and the winter spraying campaign at Watsonville is being rushed at this time, although somewhat interfered with by the rains. The spraying is being done with the lime, sulphur and salt mixture, the formula that has been used in the past with such success.

While speaking before the Grange at San Jose, last Saturday, E. M. Ehrhorn made the statement that California had three broods of peach root borers annually, while the east had only one. This makes the work of keeping the pest in check doubly hard. They hatch here in April, June and November.

LIVE STOCK.

A creamery is a certainty for Brawley in the very near future. It will start out with 200 cows.

The value of all live stock exported from the U. S. in 1903 was $42,551,174. Divided as follows: Cattle, $37,725,452; hogs, $53,180; horses, $3,142,731; mules, $354,776; sheep, $1,153,770; miscellaneous, including fowls, $121,265.

The Dairy and Produce Review is authority for the statement that the fresh butter receipts at San Francisco, for the past four weeks, were over 25 per cent heavier this year than either of the two preceding years. With considerable cold storage butter on hand and the production rapidly increasing and no outlet in sight it is predicted that the prices will take a great tumble.

Mr. Stuart, of Los Posas, missed a big fat hog and supposed it had been stolen. The 39th day after its disappearance it was found in a deep excavation into which it had fallen. It was nothing when found but skin and bones and the indications were that it had been there for 39 days without food or water. Dr. Tanner some years ago, and others, have shown it to be possible for men to fast 40 days but this is the first record breaker among the swine family that we've known of.—Ventura Free Press.

AGRICULTURE.

The berry growers of Watsonville will hold a meeting Saturday, March 5.

Broom corn to the value of $235,795 was exported from the U. S. during 1903.

About 10,000 acres of wheat and barley in the vicinity of Brawley is now growing and Geo. W. McNear & Co. are building a warehouse in the town, 70x200 feet, to take care of the crop.

The meeting of raisin growers called for last Monday at Fresno, by M. Theo. Kearney, was by him postponed till March 7th. At this time will be held the regular meeting of the Association for the nomination of candidates for directors.

The San Jose Mercury says that while feed is now plentiful and that a good hay and grain crop is assured in that section, yet the high prices for hay and cereals would continue till the new crop is harvested. One of the causes for the high prices prevailing is the 3000-ton order for hay to be sent to the Orient.

J. Ross Clark, manager of the Los Alamitos sugar factory, in a recent interview denied the reports that there would be no campaign the coming season. He stated that contracts for thousands of acres of beets had been signed and there was sufficient irrigable land near the factory to insure a sufficient crop to make a few weeks run on at least.

Delegates from twenty States met at Omaha this week to participate in the formation of the National Co-operative Grain Growers and Stock Raisers' Association. The object of the association is to "buy, sell and deal in grain, live stock and all kinds of produce on commission and otherwise, and for that purpose to build and equip elevators, warehouses, cold-storage plants, stock yards and whatever shall be necessary for the carrying on of the business of the company. The capital stock is placed at $50,000,000, with 5,000,000 shares of $10 each. The company shall be governed by nine directors, who shall have power to absorb other similar associations. State and local exchanges are provided for.

MISCELLANEOUS.

Reedley has formed an improvement club.

An earthquake shock was felt at San Francisco Monday morning. No damage reported.

At a depth of 99 feet the drillers of a gas well in Ventura uncovered an enormous flow of gas last week.

E. F. Lyman, who has been the foreman of the Spreckles sugar factory at Watsonville since its erection fifteen years ago, has resigned.

The ice plant at Imperial will be taxed to its limit to supply the ice needed for the creameries in connection with the regular demand.

A meeting of representatives of wine companies located east of the Rockies was held at New York, Monday, the principal purpose was to devise ways to meet competition from California wine manufacturers.

The latest concerning a Ventura-Bakersfield railroad, according to the Santa Barbara Herald, is to the effect that the S. P. will extend its Nordhoff line to connect those two points, in opposition to the Burson road.

Puget Sound and Portland capitalists have raised $100,000 with which to build a railroad from Dalles, Or., to Durfur, thirty miles south, during the present summer. The line will tap a remarkably rich farming country.

The State Board of Bank Commissioners this week issued licenses for four new banks to do business in Los Angeles. They are the Federal bank, the Fidelity Savings bank, the Co-Operative Savings bank and the Union bank.

Articles of incorporation have been filed for a railroad to run from Boca, Nev., to Beckwith, Plumas county, a distance of eighty miles. The capital stock is placed at $1,200,000, and of this amount $243,000 has been subscribed. Construction work is to be commenced at once.

Prof. A. V. Steubenrauch, of the State University, has just returned from Washington, where he has been to help in the final location of the government seed and plant introduction gardens, and the date palm experiment station. Mecca, at the end of the Coachella Valley, on the borders of the Colorado desert, is the site selected for the date garden. The seed and plant introduction garden will go to Chico.

Owing to the heavy rains last week, the Sacramento Valley was inundated with water. The hop yards below Sacramento were badly damaged and it is stated that no hops will be raised this season. Railway tracks in places were washed out and many truck gardens ruined. The Sacramento river at Colusa registered 27 feet, 9½ inches, during the flood's highest point. This is the highest water ever registered at that place.

LIVE STOCK.

The Lompoc Record says stock in Santa Barbara is out of danger.

The express agent at the town of Escondido shipped 104 cases of eggs in two days, last week.

The Tulare Fair Association is arranging to give a three days stock show with races the first week in October.

Geo. R. Miller, of Fullerton, has patented an anti-sucking device to use on a colt or calf, to break them of the habit.

Steel Brothers, at Imperial, have just received 300 head of milk cows and 500 head of calves and steers. The creamery they have erected is about ready to begin business.

At the Arrowhead Poultry ranch, owned by S. M. Butler, of San Bernardino, a practical method is employed to run the incubators. It is well known that the Arrowhead springs are very warm. Mr. Butler has applied this warm water, by the use of pipes, to his incubators and brooders, and so applies the heat as to render oil lamps and gasoline burners unnecessary. The application of natural heat to the incubators and brooders renders them sanitary and productive of excellent results.

HORTICULTURE.

J. R. White, of Wildomar, has shipped 25 tons of olives this season.

Orange shipments from Azusa, last week, were in amount thirty-two car loads. About one-third of the orange crop has been shipped.

Lionel Roberts, of Arlington Heights, has purchased from J. Alva Price, of Ontario, a choice ten-acre lemon grove. Lemons must pay, for Mr. Roberts already owns fine groves at Arlington Heights.

P. Duffy, of Australia, now in this country, reports that a promising market for oranges and lemons from California has been established in the Antipodes, the navel oranges of this State being already in great demand, though it has been hard to displace the small oranges sent Australia from Messina. The lemons from Messina are fast disappearing before California lemons, particularly those from Tulare district, which, an analysis shows, according to Duffy, contain 16 per cent more juice and 33 1-3 per cent more acid than those from Messina. About nine thousand boxes of the California lemons were taken by Australia and New Zealand last season.

MISCELLANEOUS.

Redding has had over thirty-six inches of rain this season.

Floods are doing immense damage in parts of the Sacramento valley.

Stockton is inundated with rain. A repetition of last year's flood is feared.

Santa Ana people are organizing an improvement club.

The commissioners to the St. Louis exposition from Solano county are preparing to make an exhibit of the onyx to be found in the hills near Tolenas springs.

The citizens of Napa decline to put up $16,000 subsidy for the proposed railroad from Napa to some point on the Marin county shore, near San Francisco bay.

The Escondido Times gives the cheering information that the trustees of the irrigation district in which Escondido is situated, are about to pay off the bonds and then own, by co-operation, the water rights of the district.

According to a recent decision of the Supreme Court of California, transportation companies may make rules and regulations beyond what appears on the face of a ticket, and that the passengers must comply with them.

Congressman Belle has introduced a resolution in the House directing the Secretary of War to cause a survey to be made of the Napa river, in Napa county, with a view of straightening the river at three points in its course.

It is reported from Santa Ana that the California Steel and Iron Company which last year secured a lease of twenty-five acres of ground on the Newport Beach bluffs and established there buildings for a smelter, has extended its lease to include 500 acres of the land in that vicinity, and will proceed at once to the development of the asphalt and crude oil deposits believed to be there.

AGRICULTURE.

Vast fields of beets are being sown at Oxnard.

The Alamitos sugar factory is going ahead at a marvelous gait. Contracts for thousands of acres of beets have so far been signed.

P. Duffy, from Australia, is purchasing large consignments of vegetables and fruit in San Francisco for a syndicate of Australian and New Zealand dealers.

A raisin grower makes the point that a small seeding plant erected at the St. Louis exposition would do a paying business by packing seedless raisins in cartons and selling them at from five to ten cents a package.

Barley growers in the Imperial valley talk about raising a perpetual crop of this grain. They think they can cut five crops a year, four of which will be volunteer.

Not to be lulled to slumber by the promise of plenty of rain this spring, the Lompoc farmers are projecting a mammoth irrigation scheme by which several thousand acres of Santa Barbara county farm lands shall be irrigated.

One advantage gained by the dry weather in Kern county is the killing off of thousands of squirrels. They literally died by colonies for want of food. Now with the rains that are coming stockmen say they will have a fair crop of hay on irrigated lands.

Pumping plants are going in all over Southern California with a rapidity unknown heretofore. This will insure prosperity, for there is not a section from Santa Barbara to San Diego that can not be made wondrously productive by irrigation.

There is not much encouragement to asparagus growers in the report on asparagus just written by Ralph E. Smith. Outside of the warning to canners of the danger which threatens this industry there is little in the report to cause the growers of this fine vegetable to feel that the future of the industry is safe.

Professor C. W. Woodworth of the Department of Agriculture of the State University, is carrying on an important economic experiment in the culture of bees and the production of honey. For this purpose he has had constructed what is in effect a beehive made entirely of glass. The important feature of the experiment is the substitution of artificially prepared food in the place of the usual plant products from which honey is made.

Luther Burbank has produced a new strain of potatoes and is now attempting to increase its size. A correspondent writing from Santa Rosa about this development, says: "About a year and a half ago Burbank secured from South America some potato seed to work upon. The seed was planted and carefully watched by the man who assists nature. He crossed and recrossed the plants in his mode of hybridization and today stated that he had between twenty and thirty thousand different varieties of the new potato under his care. The new potato will be sweeter than the old one. Its pulp will be almost of a carrot hue and will be very palatable. Mr. Burbank admitted that the new kind of potato will revolutionize the world so far as potatoes are concerned."

RAIN! RAIN!

I have a few thousand

Washington Navel Orange Trees

One and two years old at a very low price, to clear ground for replanting to orchard. Some one will get a snap in first-class trees. True to name and thrifty, healthy stock. No scale, no frost. Come and see.

$240 FOR LARGEST WATERMELONS

After 40 years of experimenting and testing all notable varieties of watermelons, we now recommend, especially, "Tendersweet" for home use and "Emerald" for both home and market. We think they are the best obtainable. Seeds 10c a paper in silver. 24 000 papers. The purchaser who grows the largest melon of either variety will positively receive one tenth of our gross sales of seeds of that variety. Caution: Wrap your silver in a little paper, and write your name and P. O. Address plainly.

LEE SEED CO., Burnt Corn, Ala.

C. H. SESSIONS, ASSOCIATE EDITOR

DAIRY BULLS.

Charles L. Thill, for years a recognized authority on breeding bulls, read a paper recently before the Wisconsin Dairyman's Association, which contains much practical information as well as valuable suggestions as how best to care for and handle the young bull. The paper in part is as follows:

"How can I be reasonably sure that any bull that you or any other breeder may send me will improve the quality of my herd?" This question I copy from a letter received in my mail two weeks ago; and is with all of us the leading question, and I wish I were able to answer it with any degree of certainty. In our few minutes' talk together we may be able to exchange some ideas that will be mutually helpful.

In the discussion of this question the first thing to do is to answer the question, "Who needs a dairy bull?" and I would answer it by saying that any man who intends to make dairying the chief aim of his live stock farming needs a pure bred dairy bull. "What breed?" you ask; I would answer, just the breed you take a fancy to, for with this one you will have the best success, because you will give it the best care.

The bull the dairyman will need will possibly not be the one that the pure bred breeder will need, for the latter, besides utility, is seeking for good looks and many fancy points. The essential points will be the same, however.

In his search for a bull, by correspondence, the dairyman must rely largely on pedigree and the reliability of the breeder he deals with. If possible, I would go and see the dam of the bull I was to use in my herd.

"How good a cow shall she be?" I would say that with the improved methods of care given by the breeders of today to their herds, no bull should be given a place in a good dairyman's herd whose dam will not make at least 400 pounds of butter a year, or its equivalent, 343 pounds of fat. The greater her record, the more valuable her son other things being equal.

An excellent plan is to buy an old bull, if still vigorous, and only in this way can you know just what kind of a sire you may have. Many of the best sires of all the breeds have gone to the shambles long before their usefulness was known.

Selecting the Animal.—In the selection of a bull for his individuality, the first thing I would want would be masculinity, which is not necessarily shown by his being coarse, or having a big head, but by his resolute, sturdy, commanding appearance, and this has nothing to do with his being cross, for this is largely education or the lack of it. He must show plenty of energy. I want him to have a good muzzle, showing good appetite, a large barrel, showing good digestive capacity. For use in a grade herd never mind if his great barrel has caused his back to sag a little.

Nearly the same words will apply to the selection of a young bull. Let him be active, robust, intelligent looking, and showing large capacity. If you wish his daughters to have good shaped udders and good sized teats see that the dam has such an udder and that the bull himself has good sized and squarely placed rudimentary teats. Let him be thin in the thighs, and show no tendency to beefiness at any place. In fact, let him be all that is different from a beef sire.

As emphasizing the thought that your bull should have a good mother, a few moments of study of some of the great dairy sires of the different breeds will be pertinent.

Bull Needs a Liberal Grain Ration.—I think one of the serious mistakes often made is to make a bull live entirely on roughage when in heavy service. Let them have all the good hay or corn fodder they want, but feed lightly of corn silage. Feed a ration of bran or bran and ground oats, of from six to eight pounds per day.

If the bull is quiet and a paddock is handy, he will be much improved by being at pasture in summer until flies get bad, but in nearly all cases it is better to keep him in the barn.

On many farms where the item of expense is not counted, a man will walk and lead a bull for an hour or more daily, and while it is doubtless efficient few of us wish to spend our time in this way. By far the cheapest way to exercise a bull is in a tread power, and we have so exercised our bulls for the last ten years. Nearly all of them learn it readily, even if old, and it will do no harm to work them an hour each day. More than that, they can easily earn their board running separator or other light machinery. It will not do to have the power very steep, for they will slip. Another excellent way to exercise a bull is to work him in a harness, and I have here photos showing bulls working single and double.

There are many other ways to exercise a bull, but I think the best one is to tie him by a rope around his horns to an overhead wire or rope 50 to 100 feet long. Set a post fifteen feet long four feet in the ground, and run a wire from the top of this post to a tree or building. If the wire runs through a hole in the top of the post to a short post close to the ground, you can readily arrange a tightener with a rod with a nut on the end.

We use about the same plan to give our bull a sun bath, but use a rope running through a pulley at the top of the post, and with a 100-pound weight on which will allow some give and take, but the rope is always tight. Many bulls tied out in this way will not walk around enough, and if you have such a one let a yearling bull or two out to scrap with him and both will get plenty of exercise.

Quite an important item of a bull's care that is nearly always neglected is the care of his feet. Don't let them grow like a certain breeder did his bull's feet a few years ago. The short course students were there judging, and one of them ventured to call the attention of the breeder to the six inches or more of toes the old bull had, and the breeder replied: "Young man, don't you know it is now winter, and of course we keep him on runners." It is a simple operation to throw a bull with a rope and to saw off his hoofs with a small saw. Nothing else is as good as a saw, and a good job can not be done unless the bull is thrown.

Animals Need Careful Handling.—The bull should have a ring in his nose about the time he is a year old, and earlier if he is headstrong, and as soon as it is healed he should be taught to lead by it, and always be handled by a staff. A daily grooming will improve his looks and doubtless do him good.

Do not keep your bull in a foul, dark pen, but if possible give him a light, airy box stall, in sight of the herd of cows, and be sure and clean his stall, and water him daily. Do not abuse him, but still be firm with him.

Never fool or play with a young bull, but always make him mind, and then as he grows older never give him a chance to know he can do anything else. Do not trust him if he is gentle, though you may do as you please about it if he acts cross. It is always the gentle bull that kills the man. Careless handling of bulls has cost our own State some of her best dairymen and breeders.

You will at this point want to come back to the first question, and desire to know what results you can expect by the use of a pure bred bull in your herd.

EVERY PAIL OF MILK

owes you a certain amount of CREAM

When a man owes you money, and you want to get it badly, you simply send around a good collector, and if he is a good collector, and the man that owes you is worth it, he'll get it.

THE BEST COLLECTOR IN DAIRY LAND IS A U. S. CREAM SEPARATOR.

It'll collect every drop of cream the milk owes you.

If your druggist does not stock our vaccines, order direct from us, we pay all charges.

If you select a bull who has a long line of female ancestors that were better cows than those you expected to breed him to, you may be almost sure that he will work a marked improvement in your herd. Just how much no one can say, for two full brothers will often, when equally as good individually, prove very different as sires.

You can ask any of our most successful dairymen in what one thing more than any other lies their success, and they will tell you, "The continued use of the best pure bred dairy sires I could find."

A JERSEY RECORD.

Brown Bessie's Nora 112398, born Jan. 27, 1896, bred by Richardson Bros., bought by A. B. White when 6 months old; sold to E. E. Moore when nearly four years old and now past eight years, is beyond doubt the best Jersey cow and money-maker on this coast. She gave Mr. White three calves, Mr. Moore four, and another will soon arrive, making eight calves from a cow not yet nine years old. The number of her grandchildren is not known except the eleven head once in Mr. White's herd. All these have been sold

Brown Bessie Nora, 112398, and her three daughters and oldest son. Nora is now owned by E. E. Moore, Compton.

except two, with Nora and her daughters, for $1645. Nora and these young heifers produced an income of $765 from milk and butter, and all were sold except Nora when two and three years old. Mr. Moore's increase and income is doubtless as good and will be greater, and he is inclined to hold on to them, and "not for sale" was his reply to an inquiry about one of Nora's promising daughters. Her son in Mr. Moore's herd is not only a prize winner, but shows a credit in service fees of over two hundred dollars. Time alone can tell what her returns will be in his choice herd. Her oldest son, Brown Bessie's Donald 56030, has been doing a great service in Mr. Southmayd's dairy herd at Gardena, but his daughters are mostly from grade cows, and, while good dairy cows, are not so valuable for breeding purposes. Brown Bessie's Nora and daughters are all large, rich milkers and sure breeders. She is very persistent, and averages over 6000 lbs. per year, and is equalled and surpassed in quantity by some of her daughters and granddaughters. She should have been tested when three years old, as her record showed by the Babcock over 16 lbs. per week, but as her milk was sold daily under contract, the churn was not used to verify the indications. She should be a grand good cow, as she is a combination of highest breeding and type. In her pedigree are no blanks—every sire has tested daughters and every dam a test and from one to five daughters in the list of tested cows. Where do you find her equal?

FROM A DAIRYMAN'S VIEW.

The rains of the past two weeks have partially revived the spirits of the stockmen in this State. While the pastures are not yet advanced sufficiently to warrant the assurance that they will support stock without further feeding, they are coming on splendidly, and with the warm weather following the copious rains will shortly care for all the stock. In Northern California the pastures are already sufficiently advanced to be of service to stockmen and in two weeks more will be strong enough to support stock without the assistance of dry feed.

Of course, so long as cattle are on dry feed prices will not materially change from what they are at present, but with the cattle on grass north of the Tehachapi there will be a signal decline in feed in this part of the State. This is devoutly desired by dairymen in Southern California and it is this prospect which is now pleasing the owners of dairy herds. A leading dairyman expressed the belief yesterday that we shall see a fine hay crop in California and that it will not require many inches more of rain to produce it. It has been the experience of almost every farmer who has resided in California any number of years, that the best crops are attained in seasons where the rains come late. When they do come in February, March and April, the crops mature and the hay and grain are of superior quality.

The fact is we are always fearing we shall be injured, and our fear is more serious than the injury actually received. Stockmen are no exception to the rule, they complain grievously at their bad luck, poor prices for their cattle, butter and grain, but go on, from year to year, churning out the same conditions. We have now every prospect for a prosperous year in the dairy business because we have a prospect for rain enough to make a hay crop, and that will cheapen feed. With cheap feed the dairyman and the raiser of fancy stock will be assured of at least usual prosperity.

CARING FOR THE COLT.

There is no better food for colts the first winter than good hay and crushed oats. A little bran added two or three times a week to keep the digestion in tone will be helpful. If a few carrots can also be spared, the colts will grow just so much better. Care should be taken to give colts plenty of exercise, especially in the winter season when the temptation is strong to confine them to their stalls.

MORE ABOUT FEEDING.

I have been writing a series of articles on feeding for eggs, telling what I have done myself in the matter, showing that exercise, comfort and proper food are the three requisites for egg production, and also trying to give some idea of what constitutes proper food. Proper food being the "balanced ration," or the ration which contains the elements of the egg. A hen must eat a certain amount to support life, to provide for the waste, for the feather-making, etc., and all the surplus she eats should be turned into eggs, and if she is of the bred-to-lay kind, it will go into eggs, otherwise it will be stored up in fat against cold weather or dearth of food, or as an all-wise provision for three weeks of incubating on eggs. For this reason the thorough-breds that are bred to lay are the hens that pay. Blood tells along all lines. We have the race horse, we have the butter cow, we have the big milkers, and now we have been working for the bred-to-lay fowls and we are getting them, and every year sees an improvement. It is not natural for the hen to lay all the year round. The quality of laying continuously has to be trained into, and bred into, and fed into, the hen and this is what I have been endeavoring to demonstrate.

Before leaving the subject I want to give the experience of Dr. Nottage, of Goshen, Massachusetts, in feeding his flock of White Wyandottes. He calls his method a new, practical, labor-saving, profit-earning method of feeding. I think seriously of trying it myself. I describe it in his own words.

* * *

"To understand better the advantages of dry feeding, let us look at the method that I employ. The fact that I have gotten rid of mixing and cooking mashes and am now feeding the most of the grain from feed boxes (hoppers) shows how much easier it is to care for a good sized flock of fowls. The advantages are apparent to all who feed their flock four or five times a day, and constantly fuss with them. I have come to be known by the farmers around here as 'the man who feeds his hens twice a week," from the fact that during the growing period, from the incubator to the pullet, who is getting ready to lay, I feed all my grain and beef scraps from feed boxes which I fill up twice a week. Bear in mind that all my young stock is on free range, and the laying birds in yards so large that they seldom wander to the ends of them; also that even this stock is let out to run at large on alternate days."

I would not advise changing suddenly any method of feeding, as it will seriously affect the egg output for a time; but after a while the hens will lay as before. The best way is to begin with the chicks right from the incubator. Looking at the subject of feeding from the beginner's standpoint, I am certainly convinced that fewer mistakes will be made and a larger number of chickens raised to a healthy maturity, by feeding dry grains and beef scraps from feed boxes constantly filled, provided that the chicks can run upon grass. There will be seen no rushing, trampling crowds of chicks; but a contented and lively set of youngsters that are plump and happy, although on free range, where some people think they are likely to run the flesh off their bones; they will find time to dig holes in the dirt, lie under the shade of the trees and enjoy life. The rapid growth of the stock will be surprising. More of this when we speak of results; do not get the idea that an experienced poultryman cannot produce like good results with his mashes, for he certainly can. However, let a beginner start with mashes and they will become "messes," and more cluck will drop out of the race than if he adopts the plan I pursue with mine.

Have plenty of grit where the chicks can pick it up for the first meal. Get your miller to mix together one part of wheat to two parts of corn and crack them so they will be a little finer than cracked corn. Place a heap of this in front of the brooder, and beside it a heap of dried beef scraps, with the coarser portions sifted out, until the chicks are big enough to eat the larger scraps. If you have any skim milk keep the youngsters on that for a drink until they become a little tired of it, which may be in two or three weeks. You can then let them have their choice between milk and water. If there is not a green sod for them to pull at, chop up some onions, lettuce or cabbage and let them have some once a day. You can now let them have only this mixture of grain, and beef scraps from the two compartments of a feed box until the young pullets are ready to go into winter quarters, provided they are upon grass all the time. In this way it is possible to grow good healthy layers and not have to fuss about "balanced rations" and forty different kinds of food.

When the pullets show signs of getting ready to lay, which they should do about September, if they are hatched in March or April, it is time to change the manner of feeding somewhat.

* * *

Each hens eats what she wants and "what she wants is usually what she needs." If you put a definite amount of animal food in a mash, some hens will not get enough meat and others will over eat. I am surprised to see how little meat they eat when it is fed in this way, yet it appears to be all they need. Just as soon as insects begin to be scarce the meat box will show it, for the hens balance their ration as far as this is concerned. Last year they laid more eggs for me than when I put the meat in a mash, and at no time have they averaged less. Leave them the beef scraps in the feed box, and take out the grain, just noting how much grain your flock is eating every twenty-four hours, put litter in the scratching pens, and feed the "same amount" of grain at different times during the day in this litter. It is time now to add oats to your bill of fare if you have not already done so.

* * *

The description of Dr. Nottage's way of feeding so interested me that I decided to give it to our readers and shall certainly try it myself, especially as

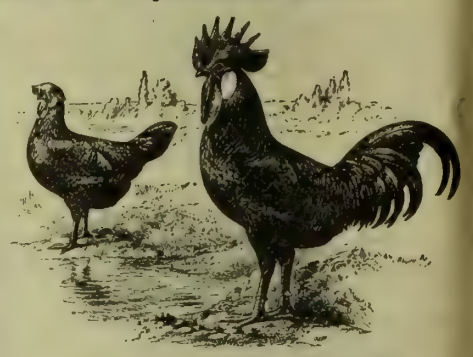
White Leghorns, Black Minorcas, White Wyandottes and Barred Plymouth Rocks



Trophy Winners at Late Los Angeles Show

In each variety my fowls won a share of the regular premiums, and in some thirteen out of a possible twenty-five, or more than all competitors combined. My winning of First, Second, Third, Fourth and Fifth Premiums on White Leghorn Cockerels was the most striking success of the show. The winning of the National White Wyandotte Club's Blue Ribbon for the best display of White Wyandottes was equally significant. But over and above all, the winning of the Times Eagle Trophy, the most coveted of all the prizes, awarded for the best display—numbers and quality considered—was the most signal and the most important victory of the entire Show. The handsome Cup offered by The Live Stock Tribune was awarded to my stock on the same grounds. These victories only add to an already long list. My fowls have received first premiums wherever exhibited. Over eighty premiums in the last five years.

My fowls are not only standard-bred, but utility-bred. Hundreds of customers attest their merit. They have proved their superiority both in the Show Room and as Breeders. There are no better fowls to be found anywhere, East or West. Both Stock and Eggs sold under absolute guarantees

this year. for the first time, our poultry supply houses are carrying the beef scraps.

* * *

Feeding.—Dear Madam: I am a new subscriber to the California Cultivator and an admirer of your section, "Poultry for Profit." I have already found valuable aid and instructions in your columns that at one reading has alone paid for the year's subscription to the California Cultivator. While your writings in the last two papers have been mainly on feeding, it would not altogether apply in my case as a matter of economy. I believe I can make the most of my feed if you will kindly give me a little instruction and information. I have never handled or dealt with fowls before and am entirely ignorant as to the raising and breeding, etc. Have got ducks, geese, turkeys and chickens and before long hope to enter the market for trade and will indeed be glad to use the advertising columns of the Cultivator. The chicken ranch is about half a mile from the slaughter house and we have the advantage of fresh blood, cooked beef heads, sheep livers, bone, cooked and green. Have also lots of corn and barley. Ranch is all green alfalfa and plenty of natural hot and cold water. Will you kindly state in your judgment and experience how I may make or construct a day's feeding for the fowl with these advantages and by adding other necessaries, and oblige, H. I. H., San Bernardino.

You certainly have an ideal location and every advantage for making a grand sucess in the poultry business, and only lack one thing and that is experience. As you have been reading my articles you would see by them that the average hen requires about six ounces of food a day, composed of about three ounces of mill stuff (i. e. grains), two ounces at least of green stuff and one of animal and mineral. But in your case, as you have not experience and it really needs great experience and a very quick eye to risk feeding a large amount of animal food, you have to watch the slightest symptom of over-feeding, lack of appetite, indigestion and liver trouble, or away will go your profits and a good many of your hens, so in your case I would try Dr. Nottage's plan and let the hens balance their own rations by keeping meat always before them, you will soon learn how much they will eat, but never let them get hungry for the meat and they will not over eat. In your place I would give them either in the scratching pens barley, corn, wheat and oats, or else in hoppers. Would let them run on the alfalfa and not make any mash at all. If you feed grain in the scratching pens about three ounces per hen would be right.

The ducks and the turkeys when mature will, I know, do admirably on this food, balancing their own rations. You must keep sand before the ducks, besides grit, charcoal, oyster shell or lime before all the fowls all the time. I trust these hints will help you; if I can give you any other information let me know.

* * *

Minorcas and Leghorns. — Dear Friend: There are a few questions about poultry raising that are not quite clear to me. First, how long will it be before I can set eggs from hens that I now have penned up for breeding purposes, they having been in the yard with other roosters?

Second, I am crossing my White Leghorns with Black Minorcas. I have been told that the chicks will be larger and good layers. Is it the thing to do?

Third, are Minorcas better layers than White Leghorns, and are they earlier setters?

Fourth, should poultry have meat every day?

Fifth, should I be careful in the selection of my eggs for setting, as to their size and shape?

I would like to see an answer to my questions as soon as convenient.—Mrs. L. E., Watsonville.

Answer first. As eggs will become fertile in two days and will be fertile in a hen separated from a rooster for three weeks occasionally, you can count a month and then be nearly sure of them.

Answer second. It is not a wise thing to do; you will only get mongrels by this cross.

Answer third. Minorcas are as good layers as Leghorns. Neither of these breeds are considered good setters.

Answer fourth. Yes; a little.

Answer fifth. Certainly; choose smooth, good shells of good shape for hatching.

* *. *

Dropsy.—Mrs. Basley: I write you in regard to my hens, thinking perhaps you can tell me what to do for them. I haven't any idea what can be the trouble as they seem perfectly healthy until, all of a sudden, they take a diarrhoea and in a few days die. I lost one yesterday, and thought I would open her, she seemed so bloated. Just as I cut the skin at the usual place of opening, water poured from her in a stream, any amount of it. I have spoken to several about it, and they advised me to write to you. I have explained it as best I can, but I am afraid it is a very poor explanation. But if you can tell me anything to save a part of my hens I will surely be very grateful. Answer through the columns of the California Cultivator.—Mrs. S. H., Lompoc.

Your hen had dropsy. Dr. Salmon, in his book on the disease of chickens, says that dropsy comes from peritonitis, also from cholera and anemia. Now, as you gave none of the other symptoms, I can scarcely help you to decide. Is the liver enlarged or the diarrhoea green? If so, I fear it may be cholera and would recommend you to move the other chickens to fresh quarters and thoroughly disinfect premises, then dig them over and plant a crop of barley or wheat. Peritonitis is difficult to treat. It frequently comes from an injury or from an egg being broken internally. Dr. Salmon recommends a little aconite in the drinking water.

Winner Buffalo World's Fair, Los Angeles, Oakland, Fresno

We won nearly every 1st, 2nd and Special on White Leghorns at Los Angeles, December, 1903. The greatest exhibit ever held west of the Missouri.

WHITE LEGHORNS

Our flock was formerly headed by the Prize Cock of the New York show, whose sire also won the first at New York the previous year. Of our bird, the judge said: "The best-shaped bird I ever saw; the finest tail and carriage I ever saw; the whitest bird I ever saw."

Among the choice leaders now of our flocks is Rob Roy, a most perfect specimen of extremely large, snow white birds, winner of 3 firsts at New York State Fair, and other prominent exhibitions. He is also a remarkable sire of prize winners. One of his cockerels is at present among the leading birds of the Eastern States. Romeo, a 7 lb., large, snowy white bird, winner of first at Madison Square Garden, New York's great show, and winner of first wherever shown, as well as being a remarkable sire. Similar remarks apply to Sunny Jim, a high-class large, perfect bird, from various egg-producing strains of large eggs.

Best Strains, Best Birds, Greatest Layers, Largest Eggs, Up-to-Date in Every Respect. None better. Lay more and larger eggs, 6 and not over 7 to the pound. Test yours.

To our flock of already choice birds, we have recently added some of the best birds to be found among the most famous flocks of the largest and best Eastern breeders, Selected not only for their Show qualities, but more essentially for their laying qualities of large eggs, which we have always made our strongest point in breeding or selecting. Among them is "WHITE ROSE," first pullet at Madison Square Garden, January, 1901; first prize bullet at Cortland, December, 1900; also winner of Golden Special for highest-scoring bird in Show, 96½ by Zimmer; also her two full sisters, and the first prize hen at Madison Square Garden, New York, 1903. Judge G. H. Burgott says of her in American Fancier, Jan. 17, 1903; "A typical grand bird." Also others equally good from the same pen. and the prize cockerel at the Pan American World's Fair, (we having previously owned the prize cock and infused his blood in our young stock). We now place him as a splendid addition of new stock, and one of the most perfect speeimens of true type of large pure white Leghorns to be fonnd.

"The hens that lay are the hens that pay." Nearly all flocks of White Leghorns are the old small variety, layers of small eggs; our strain is snow white, large birds, bred for many years to lay more and larger eggs. Ours won many first prizes all over the East at biggest shows as well as Pan-American World's Fair. Snch strains of White Leghorns give one-quarter more egg production, cost one-third less for feed and care than any other variety, while the large white eggs sell from 2c to 5c more per dozen. Buy a choice cockerel, the best in California, and improve your flock. Eggs for hatching.

W. W. HOWARD **3024 E. Main St.** **Los Angeles, Cal.**

EGGS FOR SALE

From Thoroughbred White Plymouth Rocks and Indian Runner Ducks. 15 for $1.00, 26 for $1.50. All fine stock.

H. S. THOMPSON, 126 E. Ave. 55, Los Angeles

ROUP and CHOLERA

Why do so many so called poultry medicines fail? Because they are made to sell at 100 per cent and not to cure. Palmer Poultry Powder sells on its merits. Roup or cholera is no barrier to the poultry raiser now. Before this famous remedy was tested and its value proven the hatchet was used for roup. Now Palmer's Roup Remedies are used and the fowls saved.

PALMERS POULTRY P P POWDERS

Trade Mark

You may think your fowls are healthy but do not lay. You buy egg producing food to force egg production. When your fowls are healthy nature fills the egg basket. Don't be deceived by cheap nostrums.

Palmer's Cholera Compound makes and keeps your hens healthy and vigorous and doubles the egg product. To try it is to buy it, to buy it is to make money.

Mountain View Poultry Yards

H. C. Chamberlain, Proprietor, Cotati, Cal.

INTERVIEWS WITH POULTRY PEOPLE.

(Continued from first page)

$6 per thousand and doubled the amount of lumber. The cost for material for buildings is about $8 each. All construction was done by Mr. Harrison. Brown Leghorns, White Rocks and Rhode Island Reds are Mr. Harrison's favorites and he has some beautiful stock.

Near by, Chas. H. Stearn is fitting up an incubator and brooder plant, and will apparently have a large output when fully established. H. C. Mulholland, with Leghorns, Minorcas and Rocks, is also getting established in this neighborhood and will soon be in the field with stock of best strains.

W. W. Howard, of 3024 East Main street, Los Angeles, centers on Single Comb White Leghorns, of which he has some prize winners. His birds are large, some reaching nine pounds, and of the best laying strains of that laying breed. In appliances Mr. Howard has the simplest trap nest we have yet seen. It is a patented arrangement, at the same time so simple and so easily made as to soon cover any cost of patent. It is readily attached to any box or nest and traps the hen without startling her.

Mrs. Moore, of Lamanda Park, takes great pride in her Indian Games, finest bird for the pot there is raised. Her yards are models of neatness. Scratching sheds are provided each run. Bronze turkeys and W. Rocks are other breeds carried by Mrs. Moore.

The Neff ranch, at Inglewood, has the largest acreage devoted to poultry of any ranch near Los Angeles. It is not yet fully occupied, but several hands are busy getting land and buildings into shape.

Captain Mitchell's yards at Santa Barbara is another model, not large, but everything tasty and neat. This place was illustrated and described in the issue of February 12.

H. H. Holland, of Fresno, has large yards and in number of varieties nearly a dozen. Mr. Holland puts business methods into his poultry business and his prize winnings at the various coast shows shows that he has fine stock.

These few successful plants are only an indication of the work being done on all sides. Look about and you will see such improvement being made as never before.

The following weather conditions are reported for the week ending February 29th: The weather during the week was warm and generally favorable for growing crops. Rain fell throughout the State, varying from one inch in the southern districts to over five inches in portions of the northern section.

On the low lands along the Sacramento, Yuba, Feather and other northern rivers the flooding of the grain fields will undoubtedly result in great losses, the extent of which cannot yet be even approximated. On the higher lands of the northern section and in nearly all other parts of the State the rainfall was beneficial, and crop prospects are better than at any time during the season. Grain is making rapid growth and looks strong and healthy. The acreage in the southern districts is being increased and the outlook there is considered very good. Green feed is plentiful in nearly all places, and cattle are generally in good condition. There is said to be some danger that the floods have ruined hop fields in portions of the Sacramento valley.

There has been but little injury to orchards and vineyards this season by frosts, and fruits prospects are excellent in all parts of the State.

BUSINESS NOTES.

The Imperial Investment Company, of Los Angeles, has arranged to run an excursion to the Imperial Valley every Tuesday during March. This will afford an excellent opportunity for those who are desirous of making an investigation of the developments that have taken place in that section of the country. There has been wonderful growth in that section during the past few months, so that a trip there will possess great interest for a great many. The Investment Company are located at 218 West Third street.

LIVE STOCK HUSBANDRY.

One of the important foundation stones of agriculture is live stock husbandry. By many this is believed to be the most profitable branch of farming. Some practice the feeding of all they grow to live stock raised on their farms. Certain it is that the nation that tries to farm without live stock runs the chance of impoverishing its lands. This has sent more than one nation into decay. Still, to raise live stock sucessfully one must have a good brain and lack laziness. There are some farmers that hold to grain growing because they have to work only a few months out of the year and have the balance of the time in which to rest. Such men are blamed sometimes because they do not go into stock raising in addition to grain raising. The probability is that if they did go into the raising of stock they would neglect it and so lose money. By bad methods it is easy to lose money rapidly in stock raising. Every man that is willing to study his work and has had experience in the general work of farming can go into the business of breeding and feeding farm animals with good chances of success; but before taking such a step the full cost should be counted.

E. A. Bost of Pomona, is one of the newer comers amongst the White Leghorn fanciers, and announces his stock this week to the Cultivator's ten thousand.

THE NATURAL HEN INCUBATORS AND BROODERS

Points of Merit That Are Causing Such Large Sales of These Machines All Over the U. S.

A continual circulation of pure, fresh, warmed, moist air in every part. Chicks can regulate their own wants as to heat and air by having a range of from 60 to 100 degrees to go into. Chicks will not crowd, as they have warm material to place their backs against similar to the old mother hen. No chilling or overheating. Lamp fumes or gasses entirely separated from chicks and fresh air. Brooder can be heated up in fifteen minutes in any season. The most economical on oil of anything in the shape of a brooder. One filling of lamp—3 quarts of oil—will last from five to seven days in mild weather. The incubator is guaranteed to hatch chicks as strong as the hen can. The only brooder that has and is capable of raising 100 per cent, not only once, but time after time. Our catalogue and book combined will explain more of the merits that have made these machines famous. Send for it. Mailed on receipt of 10 cents in stamps. It has helped thousands to success that have previously failed with other makes.

F. S. LOW & CO.
PETALUMA CALIFORNIA

Albers' Black Minorcas

Have now taken more prizes in California than any other three strains of this breed; lay better than any other strain of any breed; produce a uniform offspring with rich green lustre, standard size, handsome head points and matchless vigor.

EGGS COCKERELS CIRCULAR

GEO. R. ALBERS

4849 Marmion Way Los Angeles, Cal.

NESTS FULL OF EGGS

no Cholera, Roup, or Sick, Droopy Hens, but Healthy, Laying ones instead, is the paying result of using

Prussian Poultry Food

Last year my egg crop was a failure, though I have some good bloods and gave them plenty of grain, etc. I began feeding Prussian Poultry Food and I never imagined the results—the nests have been full of eggs every day.—G.W. Arbogast, Fischers Grove, Ia.

CURED CHOLERA AND ROUP.

Our chickens commenced dying with cholera. We purchased one package of Prussian Poultry Food and fed it according to directions and saved our flock. A few weeks ago we discovered that some of our chickens were affected with roup. We purchased another package of Prussian Poultry Food and stopped the disease.—D. D. Avery, Concord, Minn.

Hens are Kept Free from Lice by use of *Prussian Lice Powder.*

this v

POULTRY POINTERS.

Watch the brooder lamps.

Send the fat, lubberly hens to mar-et.

Pure bred fowls will produce more esh and more eggs than mongrels.

In marketing, eggs should be clean nd fowls well fattened and dressed.

The best poultry managers all feed ut alfalfa hay to laying hens in win-er.

Pullets rarely make good mothers; ave some of the old hens for hatch-ng.

Have movable roosts in the hen-ouse, so they can be more readily leaned.

Chickens raised in brooders should e fed the same as those that are with ens.

The incubator gets there with both eet when it comes to hatching chick-ns in winter.

Good threshed oats or cracked corn ake a good feed for the hens during he winter to make up a variety.

Fowls require more grain in winter han at any other season in order to aintain animal heat.

When your hens get sore feet, or ave bumblefoot, it means that your oosts are too high.

Sunflower seed will help materially n egg production, but a very small uantity will make a feed.

Corn is fattening and heating, and luring the winter can be fed at night o a good advantage.

Sudden appearance of disease often ollows warm weather in winter. Such isease is apt to be canker—similar to iphtheria, and very destructive. Tinc-ure of iron in drinking water and good are are preventives. A cure would ot amount to much.

BUYING EGGS OF PURE BREEDS.

Order your eggs early, so as to avoid elay. Remember that the breeder may ave no eggs when you write to him, nd must wait for his hens to lay them. Ie will always fill the orders that each him first in preference and de-ay may result, for which he is not re-ponsible. Do not wait till a hen be-omes broody. It is better to send the rder for the eggs and take the risk of rocuring a setting hen when the eggs rrive. If they reach you too soon, eep them in a cool place and turn hem daily. Do not delay your order, owever, as you will not receive them oo soon.—Woman's Farm Journal.

Do not keep the hens crowded—wenty hens in a 10x10 house will lay nly half the eggs that ten hens will. This has been demonstrated time and gain, and is one of the rules that nust be followed if success is obtained.

If you have any young birds among he flock which are not doing well, eparate them from the old fowls. Old tock and young never do well together. Pullets and cockerels eat more than he hens, but the latter usually drive hem away, consequently they do not hrive.

LAYING COMPETITION.

The Cultivator is in receipt of a let-ter from H. C. Gray, of Petaluma, in which he quotes a letter giving the sta-us of the egg production in the laying competition going on between Ameri-an and Australian fowls. The first po-ition is now held by W. Wild, with Black Orpington, 91 eggs laid in Jan-uary. Mrs. Hansel, of Loup City, Ne-braska, holds second position, with Brown Leghorns, 47 for January. W. S. Hays, of this State, with White Wy-andottes, holds twelfth position.

VETERINARY DEPARTMENT

BY DR. W. J OLIVER,
109 No th Broadway, Los Angeles

AN OPERATION NECESSARY.

Editor Cultivator: I have a fine cow, 6 or 7 years old that can not get with calf. She comes in heat every three weeks. She is all the cow I have and is quite fat, perhaps too fat. I feed her wheat bran, alfalfa, and pumpkins. Would running with other cattle do any good.—O. G. H.

Your cow will require an operation. The neck of the womb is closed. It will require the use of an instrument to dilate it. Call in a qualified veterinary surgeon.

* * *

INJURED BY WIRE.

California Cultivator: I have a blooded mare that I use for breeding only. Six years ago she cut her right hoof on barb wire; it healed but left the foot a little larger than its natural size, and very tender, but she was never lame. About a month ago she became lame, the foot swelled and broke in two places just above the hoof. There is a free discharge. It looks like the mare will lose her hoof. The mare was in good condition, but is falling off rapidly. Will she lose her colt and what can I do to heal the wound.—W. J. Crow.

Use a saturated solution of chloride of zinc; soak antiseptic cotton in solution and pack both holes full, being careful not to get any on the hair, as it will destroy it. After three days remove packing and all loose tissue. Follow with injection of sulphate of zinc, one oz. to the pint of water twice a day.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE, CAL.

THE LARGEST TREES.

While the Sequoias of California are the largest and tallest of trees where both height and diameter of trunk is considered, they are not the world's largest tree in either girth or height. A chestnut (Castanea vesca) growing on the slope of Mt. Etna, known to European travelers as the Castagno di cento Cavalli, is 68 feet in diameter. Another, the grandest and most majestic tree, prehaps in all Europe, is growing about one and a half miles farther up the mountain and is 26 feet in diameter two feet above the ground, in good condition and of extremely perfect form; the larger one mentioned being now but a ruin. This tree seems perfectly at home in all parts of California, one of our fastest growing and most handsome shade trees among exotics.

Baron Von Mueller records a eucalypt, the Messmate or Giant Gum of Australia (Eucalyptus amygdalina), which measured 471 feet in height. It seems to be no uncommon find to discover specimens of this tree surpassing in height our Sequoias. This trees also thrives with us and makes a fairly rapid growth. Prof. McClatchie, however, states that its growth has not been so rapid in California as that of other species, in no wise noted for their extreme size.

Specimens of a Mexican cypress (Taxodium mucronatum) have been found to have a diameter of 40 feet, and the same is claimed for the Oriental Plane (Platanus orientalis). In diameter our Sequoia gigantea stands next and we have numerous trees aside from the redwood, which attain a height of 300 or more feet.

* * *

HARDY PALMS, ETC.

Many complaints are heard from people who live in the colder sections of our State, that they cannot grow palms and such tropical plants and must therefore confine themselves to the deciduous trees and evergreen from the east.

In the southern part of England and Ireland they can and do grow The Windmill palm (Trachycarpus excelsus), the Dwarf Fan palm (Chamaerops humilis), and the two plants usually known here as Dracenas (Cordyline indivisa and C. australis). It seems to the writer that the Coquito palm (Jubaea spectabilis) would also thrive there, though no record of such can be found. Not only do the above plants grow in those countries, but they ripen fertile seeds, making it certain that their growth would be successful anywhere in California except in the cold mountain regions.

* * *

RARE PAMPAS GRASSES.

Many lovers of pampas grass are forced to do without a plant by reason of the great size to which it grows, others are deterred from planting it because "it is so dreadfully common." There are numerous forms of this grass to be had, many of which are of smaller growth than the common type and many, while not more beautiful than our common form, certainly very rare as yet. There are several shades of pink, the original type of which was found growing among the whites in South America. Since that time horticulturists have produced many shades of pink—some almost red. Most of these are of French origin and have not reached us as yet. There are also many with variegated leaves, striped or banded with either white or yellow. As yet, but one pink flowered form and only one variety with variegated leaves are to be found in California nurseries.

* * *

ENGLISH NAMES FOR PLANTS.

The writer has been accused (and justly so) of giving English names to plants, where none has heretofore been known. The case cited in particular is that of Jacaranda ovalifolia, a common tree, which the writer, in describing called the Blue-flowering Tree Bignonia—merely descriptive and explanatory—no one need use it unless they choose—it is more true to the tree than the scientific name, or any other that can be given in English. Scientific names should always be given for purposes of absolute identity, but it is a pity if an English speaking person, talking to those using the same tongue, cannot find proper names for common plants in our own language. Where there is an English name it should always be given, especially in books and papers intended for the grower rather than for botanists and other scientists. Where no English name exists and there seems to be need of one, either by reason of the hideousness of the Latin name or other cause, one who is thoroughly familiar with the plant is more than justified in supplying the deficiency—it is his duty. The important thing is the plant, not the name—many persons are very familiar with a plant whose name they cannot remember—simply because it conveys no meaning, being in an unknown tongue. Did it have an English name—one that had a meaning—he could readily remember the same. It is the aim of this department to be practical at all times and scientific when and where science is of unquestioned value to the reader.

TREES FOR CAPITOL PARK.

The Capitol Commissioners have received a communication from the Bureau of Plant Industry of the United States Department of Agriculture at Washington announcing the fact that the bureau is anxious to send out a number of trees to be planted in the park in order to ascertain if they will grow and flourish in this climate. As the Commissioners have signified their willingness to accept the plants, they will be forwarded shortly.

The consignment will include two plants of cupressus sempervirens, a remarkably slender and regular growing cypress, brought to the United States from Austria; two plants of the maytenus boaria, a beautiful evergreen shade trees from South America; four plants of the piptadenia cebil, a South American tree resembling the acacia. The bark of this tree is used for tanning purposes; two plants of the caesalpinia gilliesii, another South American tree, and two plants of the grabowskia glauca, a thorny solaneaceous shrub of South American origin. It has glaucous leaves and pale blue flowers and is a very desirable ornamental plant.—Sacramento Union.

SALZER'S FARM SEED NOVELTIES

Salzer's National Oats.
Most prolific Oats on earth. The U. S. Dept. of Agriculture, Washington, says: "Salzer's Oats are the best out of over four hundred sorts tested by us." This grand Oat yielded in Wisconsin 156 bu., Ohio 187 bu., Michigan 231 bu., Missouri 255 bu., and North Dakota 310 bu. per acre, and will positively do as well by you. Try it, sir, and be convinced.

A Few Sworn to Yields.
Salzer's Beardless Barley, 121 bu. per A.
Salzer's Homebuilder Corn, 304 bu. per A.
Salzer's Big Four Oats, 250 bu. per A.
Salzer's New National Oats, 310 bu. per A.
Salzer's Potatoes, 736 bu. per A.
Salzer's Onions, 1,000 bu. per A.

All of our Farm and Vegetable Seeds are pedigree stock, bred right up to big yields.

Salzer's Speltz (Emmer).
Greatest cereal wonder of the age. It is not corn nor wheat, nor rye, nor barley, nor oats, but a golden combination of them all, yielding 80 bu. of grain and 4 tons of rich straw hay per acre. Greatest stock food on earth. Does well everywhere.

Salzer's Million Dollar Grass.
Most talked of grass on earth. Editors and College Professors and Agricultural Lecturers praise it without stint; yields 14 tons of rich hay and lots of pasture besides, per acre.

Salzer's Teosinte.
Salzer's Teosinte produces 113 rich, juicy, sweet, leafy stocks from one kernel of seed, 14 feet high in 90 days; yielding fully 80 tons of green fodder per acre, doing well everywhere, East, West, South or North.

Grasses and Clovers.
Only large growers of grasses and clovers for seed in America. Operate over 5,000 acres. Our seeds are warranted. We make a great specialty of Grasses and Clovers, Fodder Plants, Corn, Potatoes, Onions, Cabbage, and all sorts of Vegetable Seeds.

For 10c in Stamps
and the name of this paper, we will send you a lot of farm seed samples, including some of above, together with our mammoth 140 page illustrated catalogue, for but 10c in postage stamps.
Send for same to-day.

ROCKING THE BABY.

I hear her rocking the baby—
Her room is just next to mine—
And I fancy I feel the dimpled arms
That around her neck entwine,
As she rocks and rocks the baby
In the room just next to mine.

I hear her rocking the baby
Each day when the twilight comes,
And I know there's a world of blessing and love
In the "baby bye" she hums.
I can see the restless fingers
Playing with "mamma's rings,"
And the sweet little smiling, pouting mouth,
That to her in kissing clings,
As she rocks and sings to the baby,
And dreams as she rocks and sings.

I hear her rocking the baby,
Slower and slower now,
And I know she is leaving her good-night kiss
On its eyes and cheeks and brows.
From the rocking, rocking, rocking,
I wonder would she start,
Could she know, through the wall between us,
She was rocking on my heart?
While my empty arms are aching
For a form they may not press,
And my emptier heart is breaking
In its desolate loneliness.

I list to the rocking, rocking
In the room just next to mine,
And breathe a tear of silence,
At a mother's broken shrine,
For the woman who rocks the baby
In the room just next to mine.

—Madge Morris Wagner.

A DOUBLE GAME.

"I tell you," said the man, doggedly, 'that I can produce a self-steering tor-pedo which answers to every one of our specifications. Any other fleet lies at your mercy with it."

"And you ask?" questioned the Minister.

"Only the means to complete my invention, and £200,000 down when it was justified my specifications."

"And if we refuse?" queried Lord Pennyfeather.

The man rose abruptly and took up his hat.

"The French Government would not be so foolish," he said curtly.

There was silence for some moments. Tall, angular, thin to emaciation, Patrick O'Hara was chiefly remarkable for his piercing black eyes, which glowed like living coals in his pale, haggard face.

"Your answer is?"—he asked, with a movement of impatience.

"If there is anything in it, 'Yes,'" replied Lord Pennyfeather. "It's a lot of money, though.

* * *

The young man sprang into a hansom cab, gave a hurried direction, and flung himself back among the cushions impatiently. For he had pledged himself to report to his chief on the authenticity of a rumor that had reached the information bureau of the Admiralty within a week, and of the week only two hours remained.

The horse was weary, dog-tired. Rain fell in torrents, and gusts of wind drove it through the open window.

"What a climate," he muttered resentfully. "Phew!"

Five minutes later the horse stumbled on the slippery wood pavement, and fell headlong.

Dick St. Aubyn was flung on the road, where he lay for a moment stunned.

The accident had occurred in a narrow street, where the houses showed "lodgings" stamped in every detail of their sordid structure. A door opened, and a flood of light illuminated the street.

The cab driver was cursing and grumbling in his efforts to raise his horse.

"My God!" cried a girl's voice. "The man is dead! Father, father, how terrible!"

In a moment the slight, black-robed figure was kneeling beside Dick, scanning his pale face.

Dick's eyes opened and looked straight into her own; then closed again.

It was half an hour later before he regained consciousness. He lay in a poorly furnished room, on a hard horsehair sofa, a delicate-looking girl leaning over him, and a tall, dark man standing behind her.

"Where am I?" he asked, putting his hand to his head.

"With friends," said the man kindly enough. "Stay quiet till you feel better."

But a flood of memory rushed over Dick's mind. He struggled to his feet, grasping the sofa for support.

"I can't!" he muttered. "I have to keep an appointment."

The room swam before his eyes, but he was obdurate. A cab must be called at once; his business was urgent, imperative. So the man, without further demur, left the room to obey his wishes. The girl stood silently watching him.

Dick turned toward her. "I must thank you," he said, "for your kindness." Then he stopped. It was the most wonderful face he had ever seen; the most beautiful, he told himself, the most bewildering.

The girl inclined her head slightly.

The door opened abruptly and the man stood on the threshold.

"Your cab is here," he said.

Long after Dick St. Aubyn's cab wheels had ceased to echo through the silent street the man stood on the wet pavement.

"Twenty-five Barkley street," he muttered. "What on earth is he doing there? And who is he?" for 25 Barkley street was the private residence of the First Lord of the Admiralty.

* * *

The butler flung open the door and announced Mr. St. Aubyn.

Lord Pennyfeather rose with a smile, "Just within your time, St. Aubyn," he said.

Dick, covered with mud, disheveled and pale, staggered into the room.

"A cab accident!" he ejaculated, as he sank into a chair. "Delay unavoidable."

"I have learned on the best authority that France has discovered a genius who promises her a new self-steering torpedo within two months. The naval experts across the channel evidently pin their faith on it. This may, or may not, account for the uncompromising attitude the Dual Alliance has adopted."

There was a silence, a heavy pause.

"Self-steering torpedo," said the Minister, after a long silence. "It's a curious coincidence. This very day I had an interview with an inventor, or a crank, who promised—Did you hear," he added sharply, "whether the torpedo was steered by a new application of a submarine electric current?"

Dick shook his head. "I could learn nothing definite beyond the fact," he answered.

"Look here, St. Aubyn," continued his chief, briskly, "you have done admirably. You must now discover the details of the new French torpedo.

* * *

St. Aubyn had been in Paris for 10 days; he was absolutely nonplussed, a most unusual position for that acute, intelligent officer to find himself in.

Dressed as a beggar, he remained outside the French Admiralty office, noting with his keen eyes every man, woman, or child who entered. St. Aubyn was acquainted with half the men who passed through the doors, but, in spite of this, he learned nothing.

One man passed in whose face Dick knew, but could not put a name to. He puzzled long, but could find no place for it in his memory. The government confidential clerk knew no more, if as much, as he did himself. He returned disconsolately to England at the end of 10 days, and reported his lack of success at 25 Barkley street.

"I don't like it," said Lord Pennyfeather, in glancing over his report. "It looks too much as if they had wind of a patent we are experimenting with ourselves. That invention I told you of——"

"May I interview your protege?" asked Dick. "He probably knows the names of the men working on the same lines."

Ten minutes later Dick St. Aubyn was bowling along in a hansom cab, acompanied by the Minister's confidential secretary. In five minutes he was standing in a large workshop, crowded with models of torpedoes, in which half a dozen men were working laboriously. Cyril Hardacre, the secretary, took

him into a smaller room beyond. A man writing at a desk lifted his head quickly, and rose to greet them.

Dick uttered an exclamation of surprise. "Why, you are the man who was so kind to me the other night!" he cried.

He held out his hand, and the other placed his long nervous fingers for a moment in his grasp. "I should much like to call and thank your daughter for her hospitality, if you will allow me," he added.

Dick found it impossible to fix his mind on explosives and infernal machines.

He shook himself angrily. What a time to be engrossed in lover's dreams, when his business was urgent and his reputation at stake. He strode along the streets, resolutely fixing his attention on the matter of torpedoes, but do what he would the pale face and deep-set eyes of Eileen's father remained before him. Suddenly he paused, his brow knit, his face clouded.

"Damn!" he muttered. "What was Patrick O'Hara doing in the French Admiralty offices last week? What a fool I was not to recognize his face before!"

* * *

"You aren't in earnest, St. Aubyn?" asked Lord Pennyfeather, looking at his visitor open-eyed.

"I wish to God I was wrong, sir," said poor Dick. "O'Hara is a swindler; he is selling his torpedo model to the French Government on the same terms as he is selling it to the English. The identical torpedo is being built in their workshops as in ours, and Patrick O'Hara works at it for a fortnight there, then for a fortnight here. He intends to get £200 000 out of each Government and then disappear."

Half an hour later Patrick O'Hara was confronting the First Lord of the Admiralty and Dick St. Aubyn.

"O'Hara," said the former quietly, "your treachery is discovered. The French model"—

The man turned livid. He gazed around him like some hunted animal seeking for a means of escape.

"The room is watched," said the Minister, quietly; "policemen are under the windows and at the doors. You are a prisoner. Great Heavens! St. Aubyn, quick!"

With a gasping, choking rattle in his throat, Patrick O'Hara flung up his arms and fell heavily forward.

"Heart disease," said Lord Pennyfeather, softly. "Has he any relatives?"

"A daughter," said Dick. His lips were dry, the words choked him.

"You had better go and break the news to her, St. Aubyn," said his chief. "You told me you knew her, I think."

* * *

Eileen gave Dick a letter, addressed by her father to the English Government, which set all doubts as to her knowledge of his guilt at rest.

Patrick O'Hara had conceived the crimnal plot of duping two governments in order to enrich the girl he felt he might so soon be called upon to leave penniless. He asked only that she might be kept in ignorance of her father's guilt if death claimed him and his duplicity were discovered.

And Dick swore to himself on the day that Eileen O'Hara became Eileen St. Aubyn that his wishes should be respected.—Exchange.

The University of California is establishing a correspondence school whereby farmers all over the State may receive an education in agricultural pursuits without leaving their plows and coming to the University of California.

RECIPES

Eat Little, but Have That Little Good

Fried Squash.—Part, remove seeds and cut in slices two inches thick, arrange in a cold skillet, add a large tablespoon of butter, sprinkle over ½ cup sugar, cover and let fry, watching closely to prevent burning. Add a little water if necessary.

* * *

Steamed Squash.—Cut up in small pieces a dry, rich looking squash. Put into granite kettle, add ½ cup water, cover tightly, set where it will cook very slowly. Stir occasionally to prevent sticking. When done the water should all be evaporated. Beat up light, add lump of butter, a little sweet cream, and serve.

* * *

Squash.—If the squash is hard-shelled chop it in large pieces and steam over some other vegetable that you are cooking for dinner, to save room on the stove, and when perfectly done scrape out in a pan or crock and season with salt and a tablespoon of sugar and mash thoroughly, then add ½ cup thick cream and whip until light and fluffy like whipped potato. Serve when hot.

* * *

Sweet Pickled Squash.—Part, remove seeds, and cut into pieces 2 by 3 inches. Boil till tender, but not soft, in salted water, drain. Have ready enough vinegar to cover. To each cup of vinegar add 2-3 cup sugar, cinnamon, cloves and ginger to taste. Boil and pour over hot. Put on weight and tie down. Will be good in 24 hours. If vinegar is very sour add part water. These are fine.

* * *

Horseradish Sauce. — Horseradish sauce is to be served hot with roast beef. Mix together, in order given, the following ingredients: Four tablespoonfuls of grated horseradish, four tablespoonfuls of powdered crackers, one-half of a cupful of cream, one teaspoonful of powdered sugar, one teaspoonful of salt, one-half of a saltspoon of pepper, one teaspoonful of made mustard and two teaspoonfuls of vinegar. When all the materials have been thoroughly mixed, heat them very hot over boiling water.—New York Post.

* * *

Parsnips should be cooked the day before you wish to use them. Peel and boil whole and set away to get cold; when you wish to use them slice lengthwise, roll in flour, and have a couple of tablespoons of hot grease in a frying pan and fry them a rich brown. Slice a common sized parsnip in about three slices; serve very hot, and your good husband will be asking every other day, "When are we going to have parsnips again?"

FOR WHITE HANDS.

Cleanliness is the first essential, and therefore when rough work has to be done it is well, if possible, to put on gloves. Prevention is better than cure, and as nothing spoils the hands like getting them grimed this should be avoided as far as possible. It is, however, not always possible to wear gloves for dirty work, so one must be prepared for one's hands being sometimes very much soiled. When this is the case, don't go to work upon them with soda, soap and brush, for that would roughen them dreadfully. Instead, take some vaseline, lard or oil and rub it into the hands, and then wash them thoroughly with a good toilet soap and a piece of flannel in warm water. The flannel will soon clean them and without injuring the skin in any way. It is far better than a nailbrush for ordinary use, and, if used regularly, a nailbrush will be found almost if not entirely superfluous. That is a thing to be remembered, for the use of a brush roughens the finger tips and nails and makes them more liable to become soiled than they need be.

EDUCATION FOR COUNTRY YOUTH.

The proposed plan of articulating consolidated rural schools, each of which cover an area from three to five miles square; agricultural high schools, each to cover nearly a dozen counties; and the agricultural college course in the State University or State college of agriculture and mechanic arts, will meet the needs of four factors—namely, the pupils, the teachers, the courses of practical instruction, and the subjectmatter to be taught. The fact that nearly every farm boy and girl who has had the advantage of a course of study in the Minnesota Agricultural High School is not only enthusiastic in its praise but desires to live on a farm, is proof that the school has a faculty of instructors peculiarly adapted to its work, and that the plan of the school and the available subject matter are such that agricultural high-school education succeeds and meets the need. While the home, the consolidated rural school, and the agricultural high school train for the farm home, there is large need for teachers, experimenters, writers, and other specialists with higher training, such as is supplied in the college course in agriculture. The proposed system of three articulated classes of schools needs all along the line teachers broadly and technically trained. No doubt many of these teachers must be educated in existing high schools, academies, and normal schools which more or less closely articulate with agricultural colleges.—Willet M. Hays.

We Have Them

WHAT?

Hand forged pocket knives and razors made by our own factory and guaranteed to be of superior quality. They are made of the best English steel, ground and tempered by hand by skilled workmen and will be found to have and to hold a good, keen cutting edge.

We will send you a fine, three blade knife for $1.00 or a two blade brass lined one for 75 cents. An extra fine concaved razor for $2.00 all prepaid.

Los Angeles Markets.

Los Angeles, March 3, 1904.

There is a feeling of satisfaction prevailing among the dealers in the various line relative to the more favorable conditions which are now in evidence.

The supply of all provisions has increased during the past week, which has caused a weaker tone.

Butter.

Butter remains steady at last week's quotations, as follows:

B. of T. Creamery, 2lb roll		70
So. Cal.. dairy do	60	62½
Cold Storage	50	55
Cooking, lb.,	21	23

Cheese.

Best domestic grades are in fair demand, and remain firm at the prices quoted.

Cal. and 3 lb. hand	18	
Cal. Downey and Anchor	17	
Swiss	19	
Imported do	28	

Eggs.

The quotation on eggs is 2 cents lower than the price heretofore quoted. It is reported from the country that there is a good supply. A further decline is expected.

Fresh ranch	18	19
Store, case count		16

Poultry.

All varieties are very scarce. No. 1 hens are quoted 1 cent higher. No further advance is expected soon. Consumers are substituting other goods.

Spring chickens, per lb	20	22
Hens, No. 1, per lb	14	15
Ducks, per lb	14	15
Turkeys, per lb	20	22
Turkeys, cold storage	22	23

Live Stock.

Prices remain firm at last week's quotations. Best beeves are in very good demand.

Hogs, per cwt	5 50	5 62½
Prime steers, cwt	3 75	4 25
Cows, cwt	3 00	3 50
Heifers, cwt	3 00	3 75
Sheep, ewes, per head	3 00	4 00
Lambs, do	3 00	3 50
Wethers, do	4 25	4 50

Potatoes.

First class varieties are advancing in the north. Local dealers report that there is an immense demand for seed. Sweet potatoes are also scarce. Market steady.

River, per cwt		1 60
Oregon, do		1 75
Local Sweets, white		3 00
Early Rose seed		2 00
Pinkeye, do		1 60
Nevada Pearls, do		1 60

Vegetables; Mixed.

All varieties are freely offered. The situation is reported as weakening on all kinds of vegetables, and lower quotations are expected.

Onions, yellow, per cwt		2 25
Nevada, fancy do		3 00
Beets, per 100 lbs		1 25
Cabbages, do		1 25
Green Peas	05	06
Lettuce, per sack		40
Tomatoes, 25 lb crate		2 00
Celery, per doz		35
Celery, per doz		40
Hubbard squash, per ton		20 00
Carrots, per sack		90
Chiles, string		75
Cauliflower, per doz		40

CITRUS FRUITS; FRESH

Good stocks are in fair demand. Market steady, at prices quoted as follows:

Fancy, 126s, per box	2 00	
Do, 150s	1 50	
Do, 176s,	1 25	
Do, 200s,	1 00	
Standards	50	
Lemons, fancy, per box	1 50	
Standard, do	75	
Grape Fruit		1 25
Limes, per 100	90	1 25

DECIDUOUS FRUITS FRESH

Four-tier Belleflower		1 75
Four ½ tier, do	1 50	
Pears, Winter Nellis 40lb bx		2 00
Northern apples, 40 lbs.	1 00	1 50
Strawberries	15	25
Loquats		05
Guavas	04	05

Fruits; Dried.

Apples	06	09
Apricots	08	09
Peaches	06	08
Raisins, per box		3 00
Raisins, loose	07	08½
Prunes	03	06
Pears		10

Beans, Dried.

Much interest is being shown in all varieties of beans. Prices all raising gradually.

Pink	3 75	3 80
Lady Washington,	3 25	3 40
Limas	4 00	4 15
Small White	3 40	3 60
Garvanza	4 50	4 60

Nuts.

Almonds, paper shell		14
Almonds, soft shell	13	13½
Walnuts, soft shell	14	14½
Walnuts, hard shell	13½	14
Peanuts, eastern	06	07
Peanuts, California	05	05½

Hay and Grain.

Notwithstanding the varying quotations recorded from day to day relative to the grain situation in the East, the local quotations remain unchanged. Hay is causing no special interest at present, there being an ample supply to fill the demand.

Alfalfa		15 00
Tame oat		15 00
Barley hay		15 00
Wheat hay		14 00
Wheat	1 35	1 45
Barley	1 12½	1 15
Oats	1 25	1 35
Corn	1 25	1 30

Mill Stuff.

Quotations f. o. b. cars L. A. are:

Rolled barley	1 30	
Bran	1 30	
Feed Corn Meal		1 50
Middlings		1 45
Cracked Corn		1 45
Oil Cake Meal		1 85
Chicken Wheat		1 65
Cocoanut Meal		1 50

San Francisco Markets.

San Francisco, March 3.

Dairy.

Butter is an over supply in the market at present, with an easier tone. The decline in prices is marked from last week.

Receipts yesterday aggregated 61,600 pounds Butter, 1689 cases Eggs, 5000 pounds Cheese.

BUTTER—Per lb:

Creamery, extras	23 @24
Creamery, good to fancy	21 @22
Dairy, extra	19 @20
Dairy, choice	17 @18
Store	Nominal
California storage	Nominal
Eastern, Creamery	Nominal

CHEESE—Per lb:

Cal. Creamery, mild new, extra	12
Cal. Creamery, mild new, choice	10 @11
Young America	11 @12½
Eastern, New York Cream, Cheddars and flats, new	15 @16

Eggs and Poultry.

The market for Eggs was unsettled and there was some disposition to shade prices in order to effect round lot sales. Supplies were quite liberal, but the quoted rates were conservative for the day's business. There is a strong bearish movement in evidence to get prices down to a low level, as speculators are getting ready to begin storing for the coming winter.

EGGS—Per doz:

Ranch, select large	20 @21
Ranch, select large	20 @21
Store	16 @18
California Storage	Nominal
Eastern	Nominal

POULTRY—Old Roosters, per doz., $5.50@6; young Roosters, $6.50@8; Fryers, $6@6.50; Broilers, large, $5@5.50; small, $4.50@5; Hens, small, $5.50@6.50; large, $6.50@7.50; Ducks, per doz., old, $5.50@6.50; young, $6.50@7.50; Live Turkeys, per lb., 15@17c; Dressed Turkeys, per lb., 18@22c; Geese, per pair, $2@2.25; Goslings, $2@2.25; Pigeons, per doz., old, $1.25@1.50; Squabs, $2.25@2.50.

Fruits and Vegetables.

Trading in oranges was animated today, and with free supplies offering, the market maintained a firm tone at sustained prices. There was a lively movement reported from the stores for both local and shipping purposes, and close clearances of a desirable quality of navels were effected well within the quoted range of prices.

DECIDUOUS FRUITS.—Apples, per box, common to choice, 75c@$1.25; fancy, $1.50@1.75.

Pears—Per box: Winter Nellis, $2.50@3.

CITRUS FRUITS.—Per box: Oranges, Navels, fancy, $1.50@2.50; choice, $1@1.50; standard, 65c@$1, according to size; Seedlings, 50@90c; Lemons, $1@2.50; extra, $2.75; Grape Fruit, $1.25@2.25; Tangerines, 50c@$1.25; Limes $6@6.50.

VEGETABLES—Asparagus, per lb., No. 1, 15@20c; No. 2, 10@12½c; Tomatoes, per box or crate, southern, $1@1.50; Rhubarb, per lb., 8@10c; Green Peppers, per lb., 20@30c; Dried Peppers, Stockton, 5@8c; southern, 8@12½c; String Beans, per lb., 10@15c; Wax, —; Green peas, per lb., 5@7c; Egg Plant, per lb., 20@30c; Summer Squash, per box, $1@1.25; Cucumbers, hot house, per doz., 50c@$1.25; Mushrooms, per lb., 10@20c; Garlic, per lb., 5@7c; Dry Okra, per lb., 12½c; Marrowfat and Hubbard Squash, jobbing at 1½@3c per lb.

The market for Potatoes clearly reflected the firm conditions noted for some days past and under a steady call for the prime table grades full figures were obtained without difficulty.

POTATOES—Per ctl.: River Burbanks, $1.10@1.20; Early Rose, $1.25@1.35; River Reds, $1@1.10; Garnet Chile, $1@1.10; Salinas and Lompoc Burbanks, nominal; Oregon Burbanks, $1.25@1.50; Nevada, $1.40; Petaluma and Tomales, $1.15@1.25; Sweet Potatoes, $2.50; New Potatoes, per lb., 1@3c.

ONIONS—Per ctl.: Oregon, $2.50@2.75; Nevada, $2.90@3.

Beans show good shipping movement and the market remains firm.

Hops.

The price for the new crop is 27@30c per lb, according to quality.

Beans.

BEANS—Prices per ctl: Large Whites, $2.60@2.75; small do, $3@@3.25; Pea, $3@3.25; Lima, $3.30@3.40; Red, $4@5; Pink, $3.15@3.35; Bayo, $2.50@2.60; Blackeyes, $2.10@2.25; Red Kidneys, $1.50@4.75.

Live Stock.

Firmness characterizes the market for all kinds of Live Stock and business in all lines continues of good volume, available supplies being quickly absorbed at strong prices. Hogs are meeting with a good demand and values for the best quality offerings show a further fractional advance. Cattle still hold marked interest and A1 steers find a quick sale at the top quotation.

CATTLE—No. 1 Native Steers, 9@9½c; second quality, 8@8½c; thing Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4@5½c; Bulls and Stags, 3½@4½c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4¾@5½c, gross weight; heavy, 4@4½c, gross weight.

HOGS—Per lb.: Hard grain fed, weighing alive 130 lbs and over, 5⅝@5¾c; weighing under 13 0lbs., 5¼@5½c; weighing 200 to 300 lbs, 5@5½c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

HAY—Per ton: Wheat, $16@18.50; Wheat and Oat, $16@18; Oat, $15@17.50; Barley, nominal; Clover, $13@14.50; Alfalfa, $13@14; Stock, nominal.

STRAW—Good to choice, per bale, 60@75c.

OIL CAKE MEAL—In lots of 20 tons, $29 per ton; 10 tons, $30; 5 tons, $30.50; less quantiti, $31. Prices are mill rates and are subject to change without notice.

OILCAKE MEAL—In lots of 20 tons, $29

CRACKED CORN—Choice quality, per ton, $29@30.

FEED CORN MEAL—Choice grades per ton $28.50@29.50.

GROUND BARLEY—Per ton, $24.

COCOANUT CAKE—In lots of 10 tons, $21; 5 tons, $21.50; less quantity, $22. Prices are mill rates and are subject to change without notice.

Cereals.

FLOUR—Net cash, Family Extra, $4.80@6.10 per bbl; Bakers' Extra, $4.60@4.80; Oregon and Washington, $4.10@4.60.

WHEAT—No. 1 Shipping, per ctl., $1.42½; choice, $1.45; White Milling, good to choice, 1.47½@1.57½.

BARLEY—Choice No. 1 Feed, $1.11¼@1.13¾; off grades, $1.08¾@1.10; Brewing No. 1, $1.15@$1.21¼; Chevalier, nominal at $1.20@1.40.

There is no material change in wool.

Fall clip, per lb: California Plains, 6@8c; Foothills, 8@10c; Middle Country, 10c@12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

CHICAGO, March 2.—Much attention has been given the wheat market the past few days, owing to the government crop report and the unfavorable weather existing in the wheat belt. The seriousness of the Argentine railroad strike was emphasized anew in a cable from Liverpool, stating that fear of a curtailment of wheat shipments from Argentina on account of the strike caused relative strength in English markets in the face of the sharp decline here yesterday. Under these influences the market opened strong.

Cash quotations were as follows: Flour was steady; No. 2 spring wheat, 92@1.00; No. 3, 85@98; No. 2 red, 93@94½; No. 2 corn, 92; No. 2 yellow, 55; No. 2 oats, 48@51; No. 2 white, 44; No. 3 white, 41½@43½; No. 2 rye, 73½; good feeding barley, 38@40; fair to choice malting, 46@58; No. 1 flax seed, 1.09; No. 1 northwestern, 1.15; prime timothy seed, 3.00; mess pork, per bbl., 14.62½@14.75; lard, per 100 lbs., 7.30@7.35; short ribs, sides (loose), 7.25@7.37½; short clear sides (boxed) 7.50@7.75; clover, contract grade, 11.65.

DAIRY MARKET.

On the Produce Exchange today the butter market was easier; creamery, 14@25½; dairy, 14@22; eggs, steady, 17@17½; cheese, steady, 10½@11½

Dried Fruits, Nuts, Etc.

NEW YORK, March 2.—The market for evaporated apples continues quiet; common, 4@5c; prime 5⅛@5½c; choice, 5½@6c; fancy, 6½@7c. Prunes are still firmly held, but without quotable change, prices still ranging from 3½@6½c acording to grade. Apricots steady; choice, 9¾@10c; extra choice, 10¾@10¾c; fancy, 12@15c. Peaches are meeting with a fair jobbing demand; choice, 7¼@7½c; extra choice, 7¾@8¼c; and fancy, 9@10c.

The Call of the Hen

A Visit to the World's Largest Poultry Farms

BY A. R. COULSON

SYNOPSIS.

This will be a continued story describing a week's drive through the section of the country that contains the world's largest poultry farms. It will show how large sheep and cattle ranges have been changed into chicken farms. It will show how some of these farms comprise 600 and 700 acres and the poultry houses are scattered over all the hills and valleys. It will be illustrated as much as possible by photographic views. We made this trip through this country with a two-seated double rig. Mr. Chas. Miles acting as guide; Mr. Cook, the expert photographer from Woodland, Cal., took along two good cameras. Some of these poultry farms were so large it took nearly all day to take views from one ranch and two of these places in one day was considered a big day's work.

On the first day we drove out to Two Rock Valley, about 8 miles from Petaluma, and our first stop was at Charles H. Purvine's place. We found Mr. Purvine a very accommodating gentleman, for although he was very busy he gave us more than three hours of his time showing us about the place.

To give the reader some idea of the mammoth poultry farms in this section of the country, we will say that C. H. Purvine's ranch that we have described contains 240 acres and to the left of this is another of the Purvine poultry farms of about 300 acres, containing over 6500 laying hens and many thousands of growing chicks, and at the right of C. H. Purvine's place is still another of the Purvine farms on which there is more than 7000 laying hens, besides the growing stock.

Out in this country is where these large poultry farms are for miles and miles. They all own their own land, thus showing that the poultry business on a large scale is a profitable one.

One of the first objects that took our eye on C. H. Purvine's place was the growing chicks, they looked so nice and healthy. Altogether there was between 3000 and 4000 growing chicks about ten weeks old. These were all divided off into different colonies in different places, about 200 to each yard.

Mr. Purvine raised all these chicks on COULSON'S CHICK FOOD. Mr. Purvine said that Coulson's Chick Food was the best for little chicks, and that on COULSON'S CHICK FOOD he could raise the largest percentage of chicks; that they thrived better on Coulson's Chick Food than any other kind of feed and he fed them on it until they were about two months old. He showed us several yards of young roosters ten weeks old raised on Coulson's Chick Food. There were about 600 of them and the attendant was then putting them into shipping coops to be taken to market and there sold for $4.50 and $5.00 a dozen. (The roosters are separated from the pullets as soon as they get two months old.)

Mr. Purvine then showed us one of the incubator houses containing four mammoth incubators holding over 4000 eggs that would hatch out in about three days and those chicks were all going to be raised on Coulson's Chick Food.

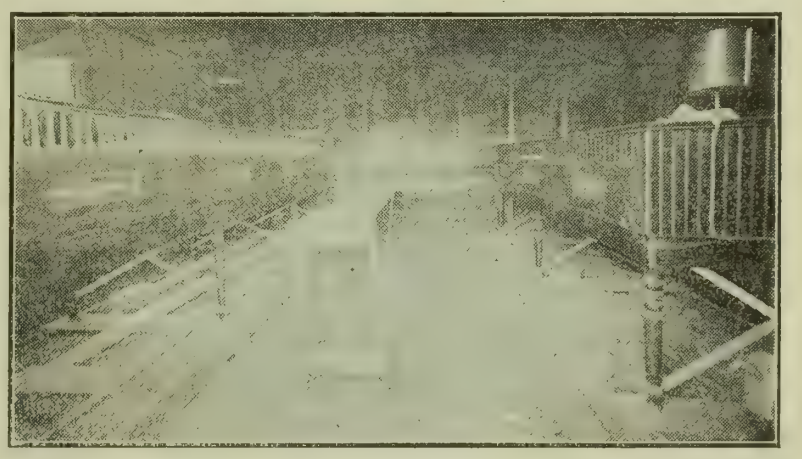
Then he took us to another incubator house (See illustration) containing two incubators holding 2500 eggs (1250 in each machine) that were just beginning to pip and the chicks would be taken out of the incubator on the following day. Mr. Purvine said it would take more than three tons of Coulson's Chick Feed to feed all these chicks during the next few weeks.

C. H. Purvine.

One of the Yards Containing 200 Pullets 10 Weeks Old; Raised on Coulson's Chick Food.

Starting Out to Feed a Few Thousand Hens on C. H. Purvine's Place.

350,000 Chickens in One Square Mile. All the Little White Buildings Are Poultry Houses.



One of the Incubator Houses Showing 2 Incubators Holding 2500 Eggs (1250 in each machine) Hatching Out More Chicks to be Raised on Coulson's Chick Food.

One of the Colonies of About 500 Hens on C. H. Purvine's Place.

All these incubators and also six more large machines in another house were to be filled and at about the middle of March they would bring out 13,000 to 14,000 chicks at one hatch. The reader may doubt the veracity of this statement, but if they will take a trip through this section of the country they will see more chickens than they ever dreamed of before. In the next ten issues of this paper we will show actual photographs of thousands and thousands of chicks that are being raised on Coulson's Chick Feed.

The moral of this story is that if you are going to try to raise any chicks this year, remember that it is COULSON'S CHICK FOOD that is used by the world's largest poultry farms with the greatest success, and it is COULSON'S CHICK FOOD that you want to get for your chicks.

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXII—No. 11 LOS ANGELES, CAL., FRIDAY, MARCH 11, 1904 Subscription $1 a Year

Annual Meeting of the Jersey Breeders

of Southern California at Buena Park

Of the 5,739,657 farms of the United States, 4,514,210 have dairy cows aggregating 17,139,674 cows two years or older. Added to that may be another million of "town cows," making a grand total of over 18,000,000 milch cows. The eleventh census gives as the average annual production 424 gallons per cow, which would make a grand total of milk production of 7,632,000,000 gallons, or a little better than 100 gallons per year for every man, woman and child of the country.

That's a whole lot. However, the pigs and the calves got their share of the skim milk, at least, and the export accounts for no inconsiderable part of the "balance of trade" which is so agreeable to Americans.

In the production of this wealth, California is not up with the best of the middle west States, however, it is the leader in the western or coast States, and almost up to the average of the whole country. While we have only about two cows to the square mile and some other States have as high as thirty, compared to population we will average well. While we are the second State in size, we are the twenty-first in population and fifteenth in regard to milch cows.

Of the dairy cows of the country only a little more than two per cent are pure bred, while probably more than a half of all are grades or of improved blood.

Of the pure bred registered dairy stock there are in this country 125,000 Jerseys, 75,000 Holsteins, 25,000 Red Polled, 15,000 Guernseys.

From this it will be seen that the little Jersey is in strong force. This is due largely to sterling qualities of this noble little animal and to the fact that an organized effort has been made to promote and bring forward the merits of the Jersey and to encourage higher standards of breeding.

The national organization, which is a strong factor in promoting Jersey interests, is the American Jersey Cattle Club. Affiliating with it are numerous State and smaller organizations. In California there are two "State" organizations. The Northern California Jersey Breeders' Association, of which N. A. Chrisholm of Jacinto is secretary, and the Jersey Breeders' Association of Southern California, which held its meeting at Buena Park this week.

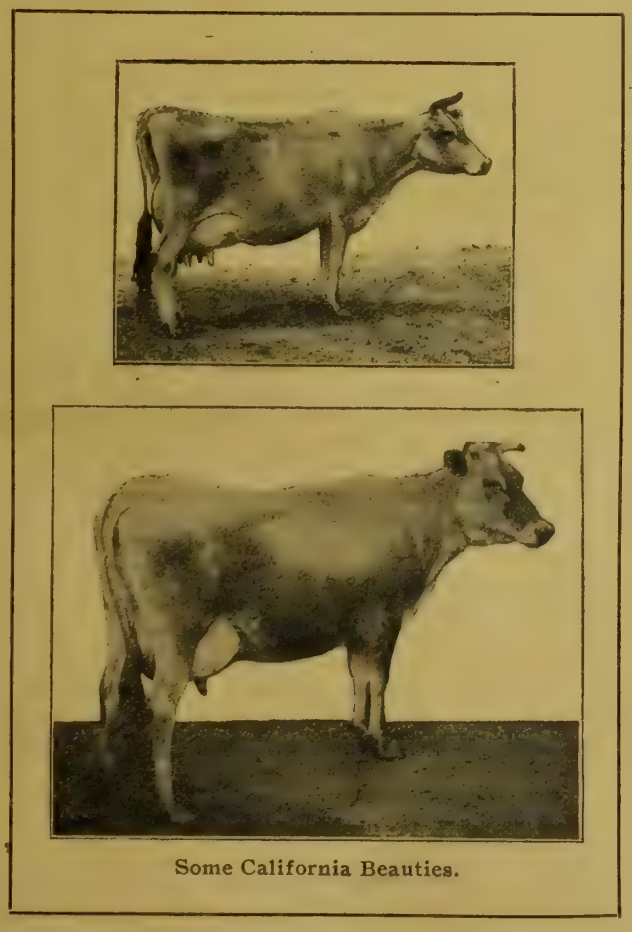
The attendance on Tuesday was very small, not a fourth of the membership being out and scarcely any of the Buena Park people. However, it was business day and no program was sandwiched in to draw the crowd.

There was some general talk regarding the qualities of Jersey milk, in its large per cent of butterfat and its desirableness, especially in the manufacture of condensed milk and cream. A committee was appointed to invite the superintendent of the condensed milk factory to appear before the association and give information as to the qualities of milk rich in butter fat compared to that of lower grade milk.

The by-laws were amended so that honorary members may be admitted. Formerly only owners of registered Jerseys were admitted to membership. This still prevails as to active participation, holding office, voting, etc., but under the amendment, editors of agricultural papers, of agricultural departments in daily papers, and professors of agricultural colleges are eligible to honorary membership without fee.

The treasurer reported $17.90 in treasury. The annual dues hereafter will be $2 instead of $1, as heretofore. The membership now numbers about fifty.

Election of officers resulted as follows: C. W. Leffingwell, Whittier, president; John A. Campbell, Buena Park, vice-president; C. W. Campbell, Los Angeles, secretary; E. M. Wheeler, Santa Ana, treasurer. For directors to serve for the coming two years: Guy H. Miller, Riverside; Geo. Y. Coutts, Orange. The hold-over directors are W. G. Cole, Anaheim; Geo. E. Platt, Los Angeles; and C. S. Burgess, of Riverside.



Some California Beauties.

Guy H. Miller read the following letter form N. A. Chisholm, secretary of the California Live Stock Association:

Mr. Guy H. Miller,

President of the Jersey Breeders' Association of Southern California, Riverside, Cal. Dear sir: One of the objects of this association is to enlarge the usefulness of our State Fair, and as the association of which you are the president is the largest one breed organization in the west, I ask your co-operation to secure a large and meritorious exhibit of your favorite breed.

The present directors of the State Fair are very liberal to cattle. The premiums in the dairy classes call for nearly $1000 to the breed that wins the herd grand sweep-stakes.

I wish to call your attention to their rule, "that when 60 or more animals of one breed are listed with the entry clerk for competition in the open classes a State class will be offered in addition," and this means, double the premium lists. The champion aged animal would then win $120.

Reliable men have informed me that there used to be a good market at the State Fair, but of late the buyers have not come, as there was no competition in the Jersey class. Shorthorns and swine were well represented at the last fair and there was plenty of buyers at good prices.

There is no question but the California fairs are not what they ought to be, and I think the blame should rest to a large extent upon the stockmen. The fair directors can kill a fair but they can't make one; this is the work of the stock breeder and farmer.

There was a special order issued upon the request of Dr. Chas. H. Blemer, State Veterinarian, by the Bureau of Animal Industry allowing cattle from below the federal quarantine line to be exhibited at the State Fair of 1902, and Dr. Blemer has assurance that he can get the same order issued again. The only possible way we can secure legislation to put our fairs in good condition is to get the stockmen interested . But as long as racing is the chief attraction we can not get any more State aid.

Yours truly, N. A. Chisholm, Sec'y.

Mr. Miller spoke favoring the exhibit because of the direct returns in possible sales and in premiums, but far more for the prestige which would follow the winning of premiums which he was positive the Southern Association could make.

C. W. Campbell brought up the matter of butter fat tests and thought the association should encourage it by bearing a half of the cost of such official tests. The National Association bears one-half of the cost when a certain standard is reached. For instance, the cow which will produce 14 pounds of butter in seven days is up to the standard, and a half of the expense borne. Mr. Campbell's point was that the balance be met by the State Association. Mr. Wheeler, of Santa Ana, and others thought the benefits to the owner of such stock were such that each individual should be glad to bear his own expense. Mr. Miller, Mr. Leffingwell and others felt that encouragement should be given to take advantage of these tests and, finally, a compromise of $5 from the treasury to aid in the test was made. The cost of the official seven day test is supposed to be from $25 to $35. Of this the A. J. C. C. will now bear one half and the local association $5, which reduces the cost to owner to a minimum —that is, if the cow comes up to standard. C. S. Burgess, of Riverside, is the official of the club who has charge of these tests.

The members seemed to feel that the thirty-day test is of slightly more value than the seven-day, yet the cost is much greater. The annual test is the better and if of not too great expense is to be highly recommended.

The second day of the Jersey Breeders' Association of Southern California was devoted to the program prepared by the committee having that branch of the proceedings in charge, and to discussions emanating therefrom. The subject of participating in the State Fair of 1904 was discussed at length and by vote of the members left to the judgment of the board of directors. A graceful and thoughtful remembrance of the interest shown by Governor Pardee in assisting to extend the quarantine line so that cattle from Southern California could be shipped north during the dry weather, was made in a motion by Mr. Guy H. Miller, which unanimously carried.

The paper prepared by C. W. Leffingwell and read by Guy H. Miller, on the "Large and Small Dairy Cow," elicited much discussion. The paper will appear next week.

How to advance the interest of the Jersey breeders of Southern California was ably discussed by Prof. E. W. Major, instructor in animal husbandry in the University of California. His address will appear later.

"Starting a Herd," was the topic of a very instructive talk by G. Y. Coutts. He said, "the bull is half the herd. Start with a pure bred bull of excellent qualities and your herd is safe. Patronize herds in your own locality when buying heifers and bulls, for thereby you come nearer knowing the good and bad points of the animals than to buy from distant herds where you can obtain no personal information of the animals or their individual merits. Make excellence rather than number the standard; seek only the pure type.

SUBSCRIPTION RATES

One dollar per annum in advance. To foreign countries within the Postal Union, one dollar and fifty cents per annum in advance.

Responsible subscribers will continue to receive this journal until the publishers are notified by letter to discontinue, when all arrearages must be paid.

When ordering a change in address, subscribers should be sure to give their former as well as their present address, in order to insure desired change.

Date on wrapper or on address slip shows time paid to, thus: John Smith, 1-04, means subscription is paid to January, 1904

Entered at post office at Los Angeles, Cal., as second class matter.

Friday, March 11, 1904

ITEMS OF INTEREST.

The Easter Harvest.—"Biddy" has come to the relief of an apprehensive public in good time and omelets are in vogue once more. The egg has resumed business at the old stand, in the forefront as an obtainable commodity. A month ago, the purloining of a dozen would have rated as grand larceny. The outlook for Easter is quite promising for chicks and children.

* * *

A Reign of Terror to Grafters.—In the light of the recent findings and sentences of some of the official malefactors and crafty contractors, one is moved to remark that if the ball of investigation keeps rolling on, it may gather up a few more "irregular" atoms that have been figuring as indespensable factors in the postal service. Buster Bristow has developed into a "holy terror" to the grafters in the public service. The momentum of the ball of investigation is too great to stop now. Let it roll on, and on, and on.

* * *

No Cause for Alarm.—Recently there has been a good deal of comment on the development of the citrus fruit industry in Porto Rico and Cuba. Some of those commentators seem apprehensive of the effect of the expansion of the orange and lemon output, lest the market be flooded. Now such views of the outlook for citrus fruits are pessimistic, to say the least. There is no more danger of glutting the market with good oranges than there is of glutting it with good apples. As yet no country has excelled Southern California in production of first-class oranges. There are thousands of people—yes, hundreds of thousands—who do not eat oranges. Some day, everybody will use that delicious fruit almost as freely as they use apples, pears and peaches. Rare, indeed, will be the times when the supply of marketable citrus products will exceed the demand. The chiefest bar to the industry at present is the excessive freight rates; but in time that insufferable obstacle will be surmounted. Don't worry about Porto Rico.

* * *

Strides of Electricity.—We are standing on the threshold of a new age in motive power. Electricity is fast gaining on steam in the operation of modern railroads. The last innovation is a parlor-sleeping buffet car with appointments so comprehensive as to put the Pullman out of business. This modern hotel on wheels is to run between New York, Boston and Washington, and to literally fly across the country at the rate of 60 miles an hour. Twenty of these cars are to be in operation within a month, and so popular is the idea of the electric sleeping car that a line is to be equipped between New York, Chicago and St. Louis within three years. It is simply a matter of a few years when the steam engine will give way to the electric motor in the matter of passenger traffic.

* * *

For Statehood.—The proposal to merge Arizona and New Mexico into one State upon admission into the Union seems to meet with favor on the part of a great many, including the President. The people of New Mexico are disposed to acquiesce in the scheme. The only reason for consolidating the two territories is that the proposed new State will never become densely populated. The physical characteristics are such that they preclude such a possibility. By consolidation, the burdens of statehood will be more easily borne. As to the size of the State, it would not be as large as Texas. The area of the consolidated territories embraces 235,600 square miles. That of Texas is 265,780 miles, an excess of 29,180 miles over Arizona and New Mexico.

While these two territories have their traditions and history, all highly interesting, these matters are not of sufficient force to carry beyond the limitations of sentiment. They have no import in point of precedent for the future. If the consolidation of Vermont, New Hampshire, Massachusetts and Rhode Island could have been effected upon their admission, the people of New England would have been much better off from a material standpoint, though it might have had the effect of cutting out a few statesmen who rose to eminence through the opportunities that statehood affords men.

* * *

Fighting Scale.—The intelligent citrus growers of this State have had so much advice on spraying and fumigation that it is to be supposed they are as well advised on the methods which best subserve their purposes as many who write upon the subject. But it is a good maxim in farming operations of any kind to be vigilant in the use of those remedies which completely destroy the enemies of our fruits, flowers or vegetables. It matters little what may be the method employed to accomplish the result, the end in view is the eradication of the pests which destroy the trees. If spraying is certain death to some scale it ought to be used until that scale is exterminated. Then, if fumigation is the means of cleaning the trees of other injurious insects, which spraying will not reach, it should be resorted to. Both measures have been proven by experience to be useful when properly applied, but the damage wrought by the use of both these specifics has been in the improper application of them. Time and again it has been urged by the advocates of spraying and fumigation that certain iron clad rules must be followed or damage will come to the trees and fruit; not so much from the ingredients themselves as from the misapplication of them to the orchards.

The intelligent observer and operator ought to spray without injury, so the fumigator should apply his ingredients with no evil results. Yet, we constantly learn of inferior work being done and consequent injury being worked to valuable citrus groves. The operator should have experience in his work, no matter what it is, and in that case the trouble which now so frequently comes from the treatment of trees will be done away with. But of one thing are we assured, the scale is ever present and to fight it, year in and year out, is the business of the orchardist.

As soon as vigilance is relaxed, that soon will the demoralization of the citrus trees begin and never cease until the pests have done their work and the usefulness of the orchard is at an end.

* * *

Test Your Cows:—The action of the Jersey Breeders Association in voting funds to encourage butterfat tests of the cows we believe is not only to the advantage of the individual members but to the association, and Jersey interests in general. Admitting that the benefits to the individual grower should impel him to make the tests without the aid of the association, yet he has not as a rule done so. This should at least start the movement, which should become general.

The best advertisement a breed can make for itself is to show by actual and official tests exactly what can be done. There are lots of "fourteen pound" cows in the country. Cows which furnish "all the milk the children could drink, a quart a day to Neighbor Jones, cream for our coffee and still make fourteen pounds of butter in seven days," are plentiful. We have all seen such cows—or the owner of them, rather—and yet the officially tested fourteen pound cow is scarce and worth dollars.

When the Jersey breeders appreciate the full worth of such information there will be greater effort to breed up and show official tests.

The best test of all, however, is the animal, wherein the whole years' production of the cow is more proof than any seven day test can be. Many cows may be wonders for a short period, yet the annual product is only ordinary. Such should be weeded out and the stayer used as the foundation of the herd.

BY J. W. JEFFREY, LOS ANGELES

THEY CONVICT THEMSELVES.

It has been the effort of this department of the Cultivator to set forth some facts concerning the claims and methods of the commission men who have now arrayed themselves against the California Fruit Agency in the eastern markets. Recently an extract was published from a paper read before the National League of Commission merchants by J. S. Crutchfield, of Pittsburg, in which the question was raised as to whether the bona fide commission man had become extinct. We have held that a return to the old method of commission consignments would be fatal, both from the inability of the small dealers to handle fruit in large quantities, and the fact that most of the commission men deal in speculative goods and therefore would always handle their own fruit to the detriment of that sent to them for sale on commission. The following extract from a letter written by a Cleveland commission merchant is significent:

"Under the present system we do not see how a commission man in this city can make anything on California citrus fruits. The California Fruit Agency sells here from five to ten cars of oranges and lemons twice a week. This fruit is offered at auction sales and any one can go and buy, from a basket peddler and push cart man to a commission man who buys from 100 to 1000 boxes at a sale. Now, where is the commission man going to make any money out of this fruit after he buys it at auction when the retailer goes right up to the auction and buys from one to ten boxes at a time which is the rule of this auction, and which we think a very poor one for the commission man.

"In our opinion we think that with a system of f. o. b. California installed it would improve this market a great deal, for then the commission man would have a chance to sell their share of the fruit in these markets."

Of course if the chief end of the fruit grower is to raise fruit for the use of alleged commission men in their speculating business, there is no question as to the viciousness of the grower attempting to handle his own products to a point as near the consumers as possible. In another plausable letter written by a commission man the writer takes a much stronger position, which, being interpreted, means that the more middle men employed in marketing citrus fruits the better it is for the business. Nothing will demonstrate the feeling of shippers toward commission dealing than the following editorial utterance of the American Cultivator:

"Commision men object strongly to the proposed new law in Massachusetts which requires dealers to notify shippers within forty-eight hours concerning the arrival and condition of the goods, and after the sale to notify at once, giving date, price and the address of the buyer. Certain dealers pronounce the bill "absurd and impracticable," on the ground that the dealer would lose some of his trade if he disclosed his list of customers, who would perhaps order direct from shippers.

On the other hand, something of the kind seems to be greatly needed to protect shippers against careless or dishonest sales and false statements of the condition of the goods. A prompt report would enable the shipper to investigate for himself. A way out of the difficulty would be to require dates and addresses to be furnished to an official committee which could investigate sales, etc., upon request. There are a few commission men whose behavior, especially towards small or occasional shippers, is a disgrace to the trade and a constant check upon the public confidence. Unless something is done to protect shippers, the business may eventually be handled directly by the producers on the co-operative plan."

A GOOD FEED SQUASH.

Editor: I am thinking of planting some pumpkins and, not having the desirable kind of seeds I wish, and also not knowing what kind I do want, I come to you for assistance. I want a kind that makes good cow and hog feed, and grows to attain from 70 to a hundred pounds. I presume the above described species will also make good pies, will it not? Please state through the columns of your paper if you can, what the name of the species is and where I can obtain same.—A. B. G., Ukiah, Cal.

The Mammoth Chile or the New Mammoth Whale, would probably answer our correspondent's requirements, the first named one being the best. This squash, under favorable conditions, grows to be very large. It is a good bearer, and can be used for pies. It is not to be recommended for this use, however, in comparison with the Hubbard, but for an all round squash, for both stock and table purposes will surpass the Hubbard. Seed can be procured from any seed house on the coast.—John Isaac.

Paul Morton, of the Santa Fe railroad, and W. W. Bowers, collector of the Port of San Diego, are to have a debate shortly over alleged violations of certain contracts entered into between the people of San Diego and the Southern California railroad, on transportation matters.

The Citrus Fruit Situation

By A. H. Naftzger, President California Fruit Agency

To the Cultivator: Complying with your request for a brief statement of the orange situation as I see it, I have to say that I cannot follow the panicky views that seem to be current at this time. If we may believe all of the statements that are published and all of the current rumors that drift about, we should be forced to the conclusion that the citrus fruit industry of California is on its last legs. It cannot be denied that this season so far, has been an extremely unsatisfactory one to orange growers, and I cannot bring myself to criticize them for feeling a good deal discouraged and very much dissatisfied with the situation. Thousands of our growers have their fortunes in their groves and are entirely dependent upon them for a living. The man who has a family to support and perhaps is endeavoring to educate his children cannot look very complacently upon a disastrous season when his orange orchard is his only source of revenue. On the other hand it would seem to me the part of wisdom for the orange grower to try to look into the situation calmly and dispassionately and not further increase his troubles by creating panicky conditions and putting the industry into disrepute. It goes without saying that if the citrus fruit growers of California should unite in preaching calamity, the business would be quickly discredited and values of orange property would depreciate enormously. Holders of securities on this class of property would become restless; foreclosures would probably follow and the situation would be much worse.

What are the facts? First: That we have a very large, and from year to year an increasingly large quantity of oranges in California.

Second: That Florida, which has practically become our only competitor under existing tariffs, has also a rapidly increasing quantity of oranges, her crop this year approximating 2,000,000 of boxes, so that between us the markets of the country are called upon to take nearly double the amount of oranges that was ever before offered. In other words, before the great Florida freeze, her shipments had approximated 5,000,000 boxes per annum. Ours were then less than 2,000,000 boxes, making a total of nearly 7,000,000. This year, the California and Florida product together will aggregate probably nearly 13,000,000 of boxes. Over against this, however, is the fact that the financial condition of the country generally is very much better than it was in the early '90s, and there are many more consumers of oranges than ever before. During the same period, however, other fruits have vastly increased in quantity all over the country and these are to some extent competitors with oranges. For some reason not yet determined, we are having greater difficulty in getting our oranges to market in sound condition than in earlier years. Whether this is due to the methods of fertilization or other treatment, remains yet to be seen. The fact is a serious one. The growers have some things to learn upon this point.

Coming down to the season's operations, for nearly two months immediately following Christmas, the whole country from the Rocky mountains to the Atlantic seaboard was almost constantly in an Arctic condition of temperature. The longest extremely cold period for many years prevailed almost everywhere. As for instance, in St. Paul the mercury never rose above zero for thirty-five days, and as far south as the Ohio river, and from mountains to seaboard the temperature was below zero many times, making it practically impossible to handle any fruit or other perishable products. We experienced therefore in our attempt to market oranges, an almost complete deadlock. A great deal of fruit was frozen hard in the cars in spite of anything we could possibly do. I cannot see how any blame can attach to any parties whatsoever for this condition, which involved an enormous loss to our orange growers. Nevertheless, the shipments up to this time have not been a total loss by any kind of means. The California Fruit Agency has paid over to its various members up to this time on the season's crop nearly two millions of dollars, with probably another million in transmission and to be realized upon the shipments out and unsold. It is true that this is not all net returns to the growers, because the packing charges must come out of it, which is a very large item. Nevertheless, it still leaves a large sum of money for the growers themselves. Moreover, it should be borne in mind that only about one-third of the crop has been shipped, and that we have much fruit of fine quality. No one can safely forecast what the markets will do, but we have every reason to expect a decided improvement from day to day. It will take the eastern markets a little time to recover from the accumulation of fruit that ought to have been distributed in January and February and could not be distributed because of the extreme low temperature, but when this is out of the way, we think the country will take a large quantity of fruit at fair prices.

No one should imagine that the citrus fruit business has reached its end. Every industry, especially of an agricultural nature, is subject to its fluctuations and temporary backsets. The grain business of the West and Northwest has at times been paralyzed, and we hear of overproduction, and the impossibility of recovery, etc., but it did recover and was scarcely ever more prosperous than it is today. The same thing is true of the stock business of the western ranches, and the cotton business of the South. It is true that the citrus fruit business is to some extent in a class by itself, and cannot be absolutely measured by the rules that apply to other agricultural or horticultural pursuits—but it is here to stay, and will be a continued source of revenue and profit for many years to come. In order to keep it so, everything possible must be done to increase the distribution—economize in marketing as well as in production.

Another indispensible thing, in my judgment, is a reduction of the freight tariff, which is too high. Upon this question I have spoken and written so many times and in so many places during the last five or six years that anything I might say now is a mere repetition. There was a time when the growers of oranges in California could afford to pay the freight rates, because of the prices obtained for the goods in the markets, but with the increase of the product, prices have tended steadily downward, and we have reached the point when the business cannot successfully carry the present freight rates. If it be true that the railroads cannot afford to carry the fruit for any less money than the present rate, then I should revise my statements above and say that the industry cannot continue to be prosperous because the fruit grower would, in that case, be compelled to discontinue business, and the railroads would lose the haul. Nothing, however, that has ever been said on the subject, convinces me that the railroads cannot afford to carry the fruit for much less than the present charges. I believe they can, and I believe they will.

Summing it all up, I should say that it is not the time for getting feverish and panic stricken. Fruit growers should address themselves calmly and conservatively to the correction of any evils that exist, but not to the discrediting or impairment of the business by wrong theories or conclusions.

MEXICO OBJECTS TO HAVING HER WORMY ORANGES KEPT OUT.

Correspondence has been going on between the Mexican government and our own in regard to the embargo upon Mexican oranges in this State. The matter was finally referred to the Secretary of Agriculture, Wilson, who decided that inasmuch as it was directly in the lines of police protection, and outside of federal jurisdiction, the general government could not interfere in the matter. It was then refered to Governor Pardee and is now being considered by him. It seems that the Mexicans have got the idea that California orange growers are jealous of the superiority of their fruit and that the existing embargo is without cause. In this, of course, every Californian knows they are mistaken, for we are not afraid to place our oranges beside those grown anywhere in the world, but we are afraid of the terrible orange maggot which is found all over Mexico and which, were it once introduced into California, would soon remove all danger of overproduction of oranges, at least of marketable ones in our State. This pest belongs to the same class as the terrible fruit fly which has destroyed the fruit industry of a large part of Australia and for which George Compere is now searching for a parasite. Once introduced it would be infinitely worse for our orange growers than is the codling moth for the apple orchardists, and as an ounce of prevention is worth a pound of cure, the embargo placed upon the entry of Mexican oranges into this State is one of the best things that the Horticultural Commission has ever done, and it is not likely to be undone by any action of Governor Pardee.—John Isaac.

SEARCHING FOR THE FRUIT FLY PARASITE.

George Compere, an old time resident of Los Angeles, now entomologist of the West Australian government, was recently in San Francisco on his way to Brazil, where he is going to search for an efficient parasite of the fruit fly, which has been so terribly destructive in Australia, and which, from information he has received, he believes originated in South America. The ravages of the fruit fly are well known to all readers of this paper, and Mr. Compere states that they are still so bad that it is almost impossible to grow fruit in the section of Australia which he represents on account of the pest. No fruit is immune, and so rapid has been the spread and so destructive the work of this pest that fruit growing in many sections is a thing of the past. If Mr. Compere succeeds in his mission and discovers the natural home of this fly and the enemy which preys upon and keeps it in check, he will have done a work that will entitle him to the thanks, not alone of his own government, but of all the world, for all fruit growing sections are threatened with this pest in time if some efficient check is not discovered. During one of his trips in Europe Mr. Compere claims that he found the parasite which keeps the codling moth below the danger line in that part of the world. That there is some agenecy which does this in Europe cannot be questioned, for the codling moth is one of the oldest of our described insects, and it has never been a serious pest in England or on the continent, and if Mr. Compere can discover, or has discovered as he says, this parasite, and will introduce it in America, he will do a work greater in its permanent results than that of any entomologist of his age.—John Isaac.

The following weather conditions are reported by the Weather Bureau for the past week:

From San Francisco Bay northward the seasonal precipitation is now considerably above normal. At Peachland the observer reports 40.86 inches up to March 1st. In all sections except the overflowed lands grain and grass are in excellent condition and have made rapid growth during the past week. The outlook is good for large crops in nearly all places that were not flooded, and partial crops may be raised on those lands. Farm work is progressing slowly in the northern sections, but good progress is being made in all other sections. Green feed is plentiful in nearly all places, and cattle are improving. The planting of summer gardens is in progress. In Southern California the rainfall of the preceding week was very beneficial and the soil is in very good condition.

Deciduous fruit trees are rapidly coming into bloom in nearly all sections, and the present outlook is good for excellent crops. The acreage in fruit trees and grapes has been considerably increased. It is reported that citrus fruits in Southern California were never in better condition than at present, but owing to marked shortage of cars, picking may be temporarily discontinued.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

THE CLOVERDALE CITRUS EXHIBIT.

I attended the late citrus fair at Cloverdale and was surprised at the size of the exhibit, the artistic merit of the display and the excellence of the fruit. I had long been under the impression that these fairs were mere play affairs at which there was a small amount of inferior fruit on exhibition, but, even knowing the citrus possibilities of the northern counties as well as I did, I did not expect to find either as large an exhibit or as excellent fruit as was shown on this occasion in a section so far north and so close to the ocean as Cloverdale is. The fruit on exhibition was of good size, fine texture, free from rag, fine grained and excellent flavor. There was a good display of lemons as well as of oranges, and these were of uniform size and had been carefully selected and well cured. Besides these there were exhibitions of citrons, olives, olive oil, walnuts, almonds, apples, and other fruits, showing the varied horticultural products of this section. The pavilion in which the exhibition was held was built expressly for these shows by the people of Cloverdale and is a monument to their enterprise. It was handsomely decorated with evergreens, brilliantly lighted with electricity, and altogether was one of the most attractive citrus fairs I have ever attended, although, of course, falling far below, in points of size and variety of fruits displayed, those given in Southern California. I afterward drove around the country around Cloverdale in which, after seeing the citrus exhibit, I expected to find some extensive orange and lemon groves, and was equally surprised to find nothing that could really be called an orange grove, the largest single tract being only 12 acre in extent, and the whole collection on exhibition had been gathered from small patches, ranging from a few trees to an acre or so scattered over the whole valley. In answer to the question, "Since you grow such good oranges, why don't you grow more?" The answer was that growing grapes for wine paid so much better, that people would not give up their vineyards for orange groves. Vines come into bearing in a couple of years after planting and the growers soon get profitable returns, and, when producing, they pay better than oranges. There is no danger, therefore, of the Cloverdale section ever coming into the market as an active competitor with citrus fruit, and her annual citrus fairs will remain for advertising purposes to show what that section is capable of. Cloverdale is certainly one of the garden spots of California, surrounded by low mountains, protected from the fogs of the coast and the winds of the valleys, its temperature is uniform, free from extremes of heat and cold, and with a soil of unlimited fertility, it can produce anything that can be grown in the State. As an evidence of the wide-awakeness and up-to-dateness of the people, I would add that I found the Cultivator very generally circulated and widely read there.

* * *

RAINS INTERFERE WITH ORCHARD WORK.

The heavy and almost continuous rains of February all over the northern counties have very seriously interfered with orchard work and in many sections pruning is behind and spraying has not commenced. Orchardists are taking every advantage of a lull in the storm to prosecute their work, but unless there is a hold-up in the downpour, a good many orchards will be too far advanced for any winter spraying.

* * *

DEMAND FOR PICKLED OLIVES.

Reports from the olive pickling works in Yuba, Sutter, Butte, San Joaquin and other counties, in which the olive is being pickled for export, are to the effect that the demand for choice pickled olives is greater this season than ever before known, so great in fact, that there will be some trouble in filling all the orders. This is an encouraging sign and indicates that the American taste is being cultivated to an appreciation of this, one of our choicest table relishes. It would seem from this that there is yet room for extension in the direction of olive growing and, of all varieties, perhaps, the Mission is the best. This is, without doubt, the best all around olive which we have. It is good for either pickles or oil. It is the most hardy of all our olives, less subject to disease than any other, more resistant to pests and the most certain bearer. The greatest enemy we have ever had for the olive has been the black scale, and this, in some sections, especially in the coast counties, has been so bad in some instances as to render olive growing impractical. The introduction and spread of the Scutellista cyanea has overcome this difficulty and today it may be claimed that the Mission has no pests or disease detrimental to it. There have been very many failures made in olive growing, owing to the fact that it has become almost a common belief that the olive thrives best on ill treatment, and that it will grow and pay on soil good for nothing else. This is not true. No tree responds more quickly to good treatment than the olive. It will drag along and bear some inferior fruit under conditions which other trees would die under, but if profit from an olive tree is desired, then it has got to be carefully cultivated, given suitable soil and plenty of it, and treated in all respects with the same care we should bestow upon any other orchard tree.

* * *

AN IMPROVED FRUIT PACKAGE.

An Oklahoma inventor has got up a new style of fruit crate which, from its description and accompanying illustrations, would seem to be an improvement on the present style of boxes, especially for shipping to long distances. The new crate is hexagonal in shape, the shape of the cells in a bee comb, and the one most economical of space known. Cleats around the top and bottom prevent the crates from being packed close together and leave ample space for the free circulation of air, while the crate itself is so arranged that there is ample room for a free circulation of air among the fruit it contains.

* * *

SPREAD OF ASPARAGUS RUST.

Around San Francisco Bay and running up the Sacramento river, asparagus growing is as important as is celery culture in the peat lands of Orange county. In many places asparagus beds, hundreds of acres in extent, are growing and hundreds of thousands of dollars have been invested in these farms and in canneries devoted to putting up asparagus for the eastern market. It will readily be seen that any disease threatening this important industry in those settlements where it exists, will be viewed with more than ordinary alarm. For many years past a disease commonly known as asparagus rust has prevailed over a great part of the east, and in some sections asparagus growing has had to be abandoned on account of its ravages. It was hoped that California was so remote from the diseased sections that she would escape contagion, and a continually widening market be supplied for our cleaner product. But such was not to be. Some two years ago Mr. Craw discovered and reported to the State Board of Horticulture that this dreaded disease had found a foothold in some of our larger asparagus fields and an attempt was at once made to prevent its further spread, but it was too late; the pest had obtained a foothold and has since spread until nearly all the principal sections are affected. So serious was this disease that, last year, the principal asparagus growers made up a purse of $2500 to be expended by the State University in the hope that some remedy or preventive means might be found which would save their industry from the threatened ruin. Prof. Ralph E. Smith, who was detailed to study up the disease, has made his report upon it and this has lately been published by the University. A perusal of the bulletin reveals little new in regard to the disease and offers little in the way of effective treatment. It, however, contains much valuable information in relation to it and offers some good suggestions in regard to its treatment. The conclusion forced upon us, from reading the bulletin, is that we have got to face the fact that the most serious of asparagus diseases is with us, and with us to stay, so far as any known relief at present is concerned. It is devoutly to be hoped, however, that future experiments may result better than those recorded here.

NURSERY

W. HERBERT SAMSON, PROP.

We have for sale all leading varieties of Deciduous Fruit Trees

OUR SPECIALTY:

Lob Ingir or Genuine Smyrna Fig of Commerce

A WORD ABOUT FIGS: We sell the genuine Fig of Commerce. Our cuttings came from bearing trees in the orchard of the Stanford estate, near Vina, and the fruit from these trees, after being examined by the best fig experts of the State, is pronounced the genuine Fig of Commerce, the Lob Ingir. Dr. Eisen says this and no other variety should be known as Smyrna, if the name Smyrna is to be used at all. We can refer prospective purchasers to the Supt. of the Stanford ranch, at Vina, for a verification of this statement. As to my own reliability, I can refer parties to any of the leading merchants of Corning, and to the Bank of Tehama County, and the Herbert Kraft Co. Bank, at Red Bluff, Cal. No one in the Unites States originated the Commercial Smyrna Fig. It is a variety which has been grown in Asia Minor for thousands of years. Parties may originate a fancy name and copyright it, but this does not make the fig they sell under a copyrighted name, any better. The fig we sell does not require a high sounding name to make it appear as the only commercial fig. All that we claim for our fig is that it is known as the Lob Ingir, the cuttings of which came originally from the famous orchards of Smyrna, Asia Minor, and is of the variety so largely imported into the United States in the dried state. We are not charging you for a private copyrighted name, but we sell you good 2 to 4 foot trees of the Genuine Smyrna Fig of Commerce at $150 per M. To fully demonstrate the methods used by some nurserymen in giving old varieties of fruit trees a new name and thereby make it appear that they have the only genuine article, we will say, how ridiculous it would be if we copyrighted a name like "Muro" and sold the old variety of Muir Peach under this name. Do not be misled by copyrighted names. We have the genuine Smyrna Fig of Commerce and if you want to confirm our statement, we do not hesitate to refer you to the above named parties. We can supply prospective planters a small sample of our dried figs for comparison with the so-called copyrighted figs. We also have for sale all varieties of Capri Fig trees, and all of our customers will be supplied at the proper time with a colony of Fig Wasps, free of cost. Address

W. Herbert Samson, Prop., Corning, Tehama Co., Cal.

BY J. W. MILLS, ONTARIO, CAL.

ASPARAGUS RUST.

Editor Cultivator: Will you kindly inform me how to prepare asparagus seed so as to kill the rust germs? I wish to plant asparagus seed and fear it may have rust germs on it. I have seen wheat and barley soaked in bluestone water, but do not know the quantity to use. How can bisulphide be used? Is it better than bluestone?—W. S. C., Highland.

Soaking the asparagus seed in bluestone will undoubtedly kill the rust germs. We would suggest wetting the berries in the solution and rolling them between the hands to remove the pulp and at the same time destroy with the bluestone solution what spores or mycelium there might be in it. Wash the seed from the pulp in the solution and allow them to remain under the liquid for ten or fifteen minutes. The seeds should be violently stirred so as to remove the bubbles of air that stick so persistently to them. Wherever the air adheres to the seeds the bluestone does not come in contact with them and there the spores, if they be there, are not killed. Make the solution one pound of bluestone to 10 gallons of water. After the seeds are removed from the bluestone water, wash them in pure water and plant them immediately. Cover the plants with burlap as soon as they appear, placing the cover high enough to be out of reach of the tops. Any kind of covering that will keep the dew off will answer the purpose. This has been demonstrated by Prof. R. E. Smith to prevent the development of the rust. If the plants thus pass through the first year of their existence without the development of rust, it will surely be safe to transport them to sections where the rust does not exist. Before planting them it might be well to dip them in a solution of bluestone and water made half the strength of that described above. Do not keep them in the solution any longer than is necessary to wet the entire plant, then rinse in clear water and plant at once and irrigate thoroughly. Bisulphide is not as good as bluestone for this disease.

* * *

PEAVINE MILDEW.

Editor Cultivator: Can you tell me through your paper what I can do to prevent my garden peas from mildewing? The mildew affects the vine as well as the peas but does not appear to do much damage except to the appearance. Will sulphur do them any good and will it harm them in any way?—C. P., Sierra Madre.

This disease does not usually affect the pea vines until warm weather comes on. Sulphuring the vines will help the vines and will do them no harm. The sulphur should be applied long before the mildew makes its appearance or it will do no good. There is nothing that will relieve the plant after the blue growth appears, as by this time the vegetative or growing part of the fungus is already growing all through the stalks and leaves and cannot be reached without actually tearing the tissue apart. The blue, dusty appearance of the vines and leaves is caused by the fruit or spores of the fungus which has about completed its growth and has done all the damage. It is a mistake to think that this mildew does not damage the vines or the peas. It stunts the vines and peas and gives them a poor flavor. The peas are so disfigured that they will never bring the best price.

There may be some failures by using the sulphur because it is necessary to have very warm weather to volatilize the sulphurous acid and this is what does the work. The grape mildews seem to start later than the pea vine mildew. One spraying with Bordeaux mixture, followed up with the sulphur after a week or two, ought to keep off the disease.

* * *

E PLURIBUS UNUM.

Editor Cultivator: Please give names of the best of the following varieties of fruit for home use? 24 apples, 4 pears, 4 plums, 4 apricots, 4 peaches.

Where can I get sugar maples and elm trees and will they do well in Orange county? Is there any kind of current and gooseberry that will do well here? What kind if gums are best for piling?—M. C. Cole, Santa Ana.

We would recommend for the home orchard, confining the limit to your figures, as follows: Apples: Early Harvest, Red Astrachan, Skinner's Seedling, W. W. Pearmain, R. I. Greening, Jonathan, Mo. Pippin and Stump. This makes a complete list for the home orchard and if you wish to use up more space, plant two trees of each variety. For pears, we would have Bartlett, Winter Bartlett, Lawson and St. Andre. Plums: Tragedy, Cherry plum, Ontario, Satsuma. Apricots: Newcastle, Hemskirk, Royal and Tilton. Peach: Imperial, Early Crawford, Pansy Pabor and Foster.

You may get sugar maples, elm trees from any of the large nurserymen who advertise in this paper. We do not know if these trees will thrive in Orange county. There is no way of telling until a trial is made. If you can trace up some of these trees that may be growing around or in Santa Ana, you would have the best possible evidence now at hand. Currants and gooseberries do not thrive with us and we should judge that they would do better in your locality. These fruits need a cool, moist climate and it can hardly be hoped that they will do as well with you as they do in the bay region of San Francisco, where the climate suits them to perfection.

The Eucalyptus Globulus is used more exclusively than any other gum tree on this coast for piling. The principal reason may be that it is the most numerous and gives good satisfaction, though there may be other varieties that surpass it. Eucalyptus rostrata is one of the most valuable timber trees, and will, perhaps, prove more durable than Globulus when used for piles. Rostrata does not grow as fast as the latter and for that reason has not been planted very extensively.

* * *

HOME ORCHAD AGAIN.

Editor Cultivator: Will you kindly give a list of the following fruits: Apple, peach, pear, plum and fig, that you would recommend to plant for home use along the coast in Southern California.—A., Montalvo.

The above list is a good one, with perhaps the addition of the following peaches: Amsden June, Wiggins, Lewkin's Honey and Salway. Baldwin's Late is a good peach, but a shy bearer. We doubt if there is any fig that would do well at Montalvo, it being so near the coast. Our best white fig is White Datatto, but we doubt if it would mature with you.

* * *

OLIVES.

Editor Cultivator: I am sending you olives, all off the same tree; will you please tell me what variety they are? —Subscriber.

The olives you send are without doubt Cayon.

* * *

APPLES IN COLD STORAGE.

A great deal of interest is being manifested in apple culture in certain parts of California and the amount that will be shipped out will increase yearly. The storage problem is an important one and it is fortunate that the department of Agriculture at Washington has made exhaustive studies in this work. Our growers are just far enough along to need the information obtained. Mr. G. Harold Powell, who is now here for the purpose of investigating along the same line in citrus fruits, with his assistant, did this work, which is now published as Bulletin No. 48 of the Bureau of Plant Industry. It should be in the hands of every apple grower who expects to store his fruit for the winter trade or expects to ship it away. While our local conditions are entirely different from those where the investigations were carried on, the principles that were worked out are fundamental and will apply anywhere. The investigations were carried on in ten different States, reaching from Kansas to Maine. One hundred and eighty varieties of apples were used in the experiments. Different kinds of culture, packages, wrappings, time of picking as related to maturity, different ages of trees from which the fruit was picked and different methods of treatment before and after cold storage were part of the plan of work.

Make Your Own Fence...

We will furnish the wire at 2c per pound, No. 14 guage. Weighs about 1¼ pounds single strand per 100 feet. Figure it yourself and get a good fence cheap. You make mesh or openings to suit requirements. This is galvanized wire that has been used for other purposes, or it would be worth two or three times our price. Remit for amount required and get quick shipments. No quantity under 100 pounds supplied.

Lee Chamberlain & Co. Station C 105 North Main St. Los Angeles, Cal.

Conducted by PROF. A. J. COOK, Claremont, Cal

[In Prof. Cook's article last week he was made to refer to Mr. Pease, of San Bernardino county, as manager of the famous Arlington Heights estate. This was an error for which Prof. Cook was not responsible. Mr. James Mills is manager of that estate.—Editor.]

THE CLUBS.

If any one has doubts about the utility of the club movement, and questions in the least their usefulness, let him take time to attend one of the meetings of the San Dimas Heights Farmers' Club and he will be speediiy converted to the fact of their exceeding value. It was my pleasure to meet with the club at its last meeting. The usual number of considerable over 100 greeted the speakers, and were alive to every word that was uttered. How easy it is to enlist all in any enterprise that promises good to the community, where there is such a club. We met in a fine hall owned by the club that will seat five hundred at least. A goodly number of comfortable chairs, a fine piano, and a nucleus of a good library already are theirs. San Dimas is one of our best and most desirable orchard sections, and this alone would attract would-be purchasers, but the fact of this most flourishing club has had, I am sure, not a little to do in giving to this section the proud reputation that it bears. We know that the small grower, especially of lemons, is at ill-advantage with the large growers who have hundreds of acres and ship hundreds of car loads of fruit. How can this misfortune be met? Plainly by co-operating and combining the small growers, so that they can handle a great output. But how can we get the general grower to exercise the great caution that must be observed to create a uniform pack, and send only the best fruit to market? Plainly, here comes in the best work of the club. Here shines out the example of San Dimas' victory. She has now a lemon house that vies with the Limoneria and Arlington in the excellence of its pack, and the fine condition of the fruit as it goes to the eastern markets. And she is not done yet in working for the first place. Her manager knows full well the excessive care necessary in picking and handling the fruit, and with the club and its large attendance at his call, he can impress his ideas upon others, so that they will bear quick and ample fruit. I am glad to know of the many splendid clubs, and the magnificent work that they are doing; and I shall not rest till every neighborhood has one of these most beneficent organizations.

* * *

CLUB PROGRAMS.

Mrs. E. McL. is one of the active members of the live Carpinteria Club. She sends a program of their last meeting and suggests that the Cultivator publish it. I like the idea, and like her urgent request that more of the club programs and proceedings be published. She says that nothing would be more interesting and helpful.

Apropos to this suggestion, I wish to give the program of our club at the last two sessions: At the February meeting we had a talk by Mr. Geo. Dunlop of Hollywood, on "Direct Legislation," and an experience meeting on "Scale Insects and Red Mites, and the Diltillate Spray." At the last meeting we had "Direct Primaries," by Hon. E. M. Camp, of Sierra Madre, and "Ethics in our Schools," by Dr. G. J. Roger. I know some object to two of these subjects, as they are "political." Not so our club. It has worked too long for that. Indeed a vote of thanks was passed to the program makers for bringing in these themes. While this may be politics, it is not partisan politics, and as the success of these measures would be fatal to the machine, the boss and the lobby, we are likely to hear too little of them in the regular campaigns. To give information on great themes that vitally concern the great body politic is the proud work of our farmers' clubs.

* * *

POTATO SCAB.

Mr. Miller, Pomona, asks me to give the latest regarding Potato scab. Up to a very late date, not much has been known as to the cause or cure of this disfigurement of our great American "Tubers." Some have thought that insects, or "Millipeds," were the cause, others that too much nitrogen in the soil occasioned the scab, while others have suggested a fungoid or bacterial origin to the disease. Of late two or our stations have shown that there are two forms of the disease, one deep, caused by fungous attack, and the other more superficial, and caused by bacteria. Prof. Thaxter, of Yale, is the discoverer of the fungus. Prof. Thaxter has not only demonstrated the presence of the fungus, but has shown that it can be inoculated at will. As we now know the cause we may hope to soon have a cure.

FOUL BROOD AND BLACK BROOD.

We have known for some time that these two diseases were amenable to the same treatment, but have supposed that they were caused by two different bacteria. We now learn from the Pathological Division of the Agricultural Department at Washington, that the same bacillus causes the black brood that produces foul brood. The experts reported to the same effect last year, but their decision was doubted, so that they have gone over the same ground this past season, and have examined many samples, and now assert positively that the same specific germ causes both diseases. Such work by the department ought to be very much appreciated, and I am sure it is. It is well known that foul brood in California takes on quite different forms. We are all the more sure now that the same bacillus causes both forms, and now we must add black brood as a third form of the mischief that is caused by the bacillus of foul brood.

* * *

HONEY PROSPECT.

Bee keepers are very much discouraged over the honey prospect for the coming season. It does look very dark indeed now for the bee keepers. Yet I do not think that we must give up the crop yet. If we shold have frequent rains from this time, I think we might hope for a considerable crop, if the season from this on is favorable. It used to be thought that we must have at least 15 inches of rain to insure a crop. We now know that much less is required in case it comes so as to do the most good. If we could have timely rains through this month and April, I believe we might hope for a good yield of honey yet.

* * *

INSECT FRIENDS.

Dr. B., of Lordsburg, asks how we may know whether it is the Scutellista or lady bird beetles like the Rizobius, that are destroying the black scale in our orchards? The easiest way is to note whether there is a small hole in the back of the scale or not. The larva of the Chalcid or Scutellista is a white, footless maggot-like larva, while the larva of the Rhizobius is a long, greenish grub with three pairs of legs just back of the head. Both are often found under the scale—the Scutellista always—but the larva of the Rhizobius is active and moves freely about, while the larva of the Scutellista is almost motionless. The pupa of the Lady Bird is usually found outside the scale, and is sub-spherical, while the larva of the Chalcid is of the usual elongated form, and is always found under the scale. Of course the mature insects will be very different. The black Rhizobius is the usual form of the lady birds, nearly a hemisphere, and is more ready to walk than to fly, when disturbed; while the Chalcid is a small black fly, ready to take wing and fly off at the least scare. The lady bird lays its cluster of eggs on the twigs or leaves near the scale insects, while the Chalcid fly lays the eggs singly in the scale and, as they hatch, the larva destroys the scale. So one of the Chalcids destroys one scale, while one Rhizobius may eat up several scale insects. Each fly, however, lays many eggs and so she is the cause of the taking off of numerous scales.

* * *

PLOWING OR CULTIVATING, WHICH?

I think most of our orchardists plow their orchards at least once a year. I think most of the best ones plow twice. The most popular plan seems to be to plow early—after the first rain—and again in late winter. If a cover crop is grown, it seems best to plow as it is sown, in the early days of September, and again when it is plowed under, not later than February. I presume that good results will be gained if the earth is stirred deeply, whether it be done by cultivator or by plow. Yet I can but believe that it is wisest to turn up the deeper soil that it may get the benefit of the air. In case the cover crop is used, and it will be more and more, then one plowing is absolutely necessary. Mr. Mills of the Arlington Heights orchard, told me that he greatly prized the disc plow. It did seem to be doing splendid work as I saw it turning under the great growth of peas.

* * *

CHANGE IN APRIL INSTITUTES.

There is a slight change in the dates of the April institutes, as follows: Anaheim, March 31st and April 1st; Monrovia, April 1st and 2nd; Elsinore, April 4th and 5th; Hemet, April 6th and 7th; Cucamonga, April 8th and 9th; and Inglewood, Monday April 11th. Prof. S. S. Twombley, of the San Luis Obispo Ploytechnic School will be among the lecturers and it is expected that Prof. Th. J. Means, of the Department of Agriculture, will lecture on alkali.

Good Money

In orange and lemon orchards provided you have the right climatic conditions, a good soil, and good trees. We take it for granted that if interested in planting a grove that you are well settled on the matter of soil and climate, hence we want to talk

Good Citrus Trees

—To you, for we feel quite sure that is the only kind we have; besides, our trees are not only good, but the best of their kind, while our prices are no higher than those asked for inferior specimens. An examination of our superb stocks will authenticate this statement. May we have the pleasure of a personal visit from you in the immediate future?

Good Advice

You know the proverb is that "the meanest vice is advice,"—but that depends. For instance, we have issued a booklet giving the practical side of the orange and lemon business; how to plant, cultivate, irrigate, prune and care for an orange grove. Possibly you would like a copy; it is yours if you will write us the probable number of trees you will want, and mention this advertisement. Correspondence a pleasure.

Coast News and Notes

OF INTEREST TO FRUIT GROWERS, STOCKMEN AND AGRICULTURISTS

Tropico has organized a berry growers' association.

Whittier will commence using the Home telephone service about April 1.

Reports from western New York are that the Elberta peach crop for 1904 is ruined.

The Sacramento river was the highest at Colusa, and several other points on the river, it has ever been; so say the records.

The big Moulton ranch at Colusa, which contains about 18,000 acres, was recently sold for approximately one million dollars.

Apple growers of La Grand, Oregon, have found an eastern market for their holdover crop and are now shipping in car lots. They are getting from 35 to 40c per bushel.

For the first time in the history of the coast, potatoes in car lots are being shipped from Washington and Oregon to Kansas City, and eastern markets. The demand has caused prices to jump from $11 to $16 per ton.

Next week the citizens of Hemet will meet to make arrangements for the two days' institute to be held April 6th and 7th. The program includes papers by F. C. Baker, Mrs. Minnie E. Sherman of Fresno, and Prof. A. J. Cook.

The members of the Women's Club of Whittier planted a thousand geraniums on Reservoir Hill last week. Other flowers and shrubs will soon be planted there, the intention being to make it one of the beauty spots of Southern California.

As an indication of the wide extent of the ravages wrought by the San Jose scale in the East and South, a late bulletin issued by the Agricultural department, tells of experiments made with the California wash in Illinois, New Jersey, New York, Maryland, Georgia and other States.

The annual meeting of the State Board of Trade was held at San Francisco, Tuesday, at which time most of the old officers were re-elected. In his report, Gen. Chipman gave the exportation of wine for 1903 as 863 carloads over that of 1902; vegetables, 1705 carloads; canned fruit, 1365 carloads; citrus fruits, 7395 carloads; green and deciduous fruits, 380 carloads. Five hundred ninety-eight carloads of oranges were shipped in excess of the preceding year, a large percentage of the increase being in the northern and central counties.

At the Fresno raisin growers' meeting, held last Saturday, the following members of the association were placed in nomination for directors for the ensuing year: Robert Boot, Hector Burness, M. Theo. Kearney, John Fairweather, A. L. Sayre, D. D. Allison, A. V. Taylor, T. C. White, T. G. Alexander, A P Jordan, J Q Anderson, Joseph Jarvis, J H. Beecher R. K. Madsen, L. D. Scott. At the conclusion of the association meeting Mr. Kearney called to order a mass meeting of growers and presented his plan for controlling the raisin output and markets. Another meeting will be held in two weeks from that date to further discuss the raisin marketing question and to hear the report of a committee of seven, which had been appointed to pass upon the plans proposed by different members.

At the last Fruit Growers' convention held at Fresno in December, a resolution was passed that a committee of fifteen be appointed to devise a plan for the co-operation of raisin prune and all classes of cured fruits and nut growers of the State. The committee to report to the next Fruit Growers' convention. In accordance with the resolution, the following committee was this week appointed by Elwood Cooper, State Horticultural Commissioner: A. R. Sprague, chairman, Sacramento; F. H. Babb, San Jose; S. G. Rodeck, Campbell; A. L. McCrea, Fresno; Arthur R. Briggs, Cal. State Board of Trade, San Francisco; F. Q. Story, Chamber of Commerce, Los Angeles; H. P. Stabler, Yuba City; John Markley, Santa Rosa; F. A. Chadbourne, Suisun; Geo. A. Lamiman, Olinda; R. C. Allen, Bonita; R. H. Bishop, Orange; W. P. Weber, Santa Paula; Thomas Jacob, Tulare; Frank E. Kellogg, Goleta.

The Willamette Valley Prune Association is making an effort to dispose of its prune holdings and, according to the Packer, have adopted the following plan to that end. The association has employed N. J. Damon to go into Middle Western cities and arrange a house to house canvass for the sale of fruit in 25-lb. boxes. The price fixed is 10c per lb., delivered, making a box of prunes cost $2.50. The plan includes the payment of 50c per box to agents. Mr. Damon is already in the East and is supposed to be at work, but no reports of results have been received. Believing that a 25-pound box selling for $2.50 is too large to find a ready sale in cities, the association is planning to procure pasteboard boxes, holding from 2½ to 10 pounds, to be used in putting prunes upon the market in popular sized packages.

THE PRUNE CROP BEST.

At the meeting of the San Jose Farmers' Club, held last Saturday, C. D. Harvey presented a very able paper relative to diversifying crops in the Santa Clara country. Mr. Harvey was very strong in his conviction that there is more money in raising prunes than in general farming, and that the key note to future sucess is to be found in a proper marketing system. We quote in part from Mr. Harvey:

"My early life was spent upon a New England farm, where diversified farming was recognized and practiced in its fullest sense. The meat, butter, cheese, poultry, eggs, grain, as well as all food supplies for the stock, were produced upon the farm. I was familiar with, and still advocate diversified farming and rotation of crops where conditions are favorable, and were I again located where soil and climate, frosts and snow, sunshine and summer showers favored such diversity, I would practice and encourage the same course, but when the peculiar adaptability of soil and climate have shown that prune culture has been more profitable than other crops in this locality, it prompts every intelligent farmer to cultivate that which secures the best return with the least competition from the outside world. It is this which has built up this industry and filled this valley with small holdings and beautiful homes. Many are too small to support a family on the diversified farming plan, and if adopted as a general plan it would compel the small owners to abandon the small holdings, which would then be absorbed by the larger owners. This results, not from any failure to produce the prune successfully, but, as was suggested in the published interview with Mr. Wooster, as follows: 'The market did not expand as rapidly as the industry and consequently prices fell, and growers began to grumble that there was nothing in prunes.' This is the situation fairly and briefly stated. A brilliant success in growing a prune which has no superior in the world must now be abandoned because no corresponding effort is made to market the same.

"A strange remedy is suggested to plant something else and pull up the trees, anything to limit and destroy the industry.

"Suppose we were to try a direct and economic distribution in the different markets of the world, under the control of the owners of the products instead of raising a miscellaneous lot of farm products to be handled and marketed by an equally miscellaneous lot of middle men, whose interest in the industry is limited to the brokerage commission they can secure, would this not be a more feasible remedy than to retain the evils of the present system, and increase the competition in the outside markets where at present we have little opposition and thus retain in our valley the hundreds of small homes which now exist, and profit by the reputation we have already won for the Santa Clara prune, taking no back steps nor back seats in the commercial prune markets?"

The Horn of Plenty awaits every Farmer who uses Nitrate of Soda
(THE STANDARD AMMONIATE)
In the Orchard or for Small Fruits, for Grain, Grass, or Vegetables, results are certain. 100 pounds per acre, used as a Top Dressing for a growing crop, with or without the use of other fertilizers, will yield results that will be to the farmer like Finding Money. Send name and complete address on Post Card for my new Bulletin, "Food for Plants."
I have nothing to sell; no catalogues. I am simply publishing information of Experiment Station Results from the use of Nitrate of Soda, and giving it free.

Coast News and Notes

CONTINUED

LIVE STOCK.

Horses and mules from Northern California are being shipped to the Philippines in large numbers.

It is estimated that there are about 7,000 head of cattle in the Imperial valley and about 600 head of dairy cows, and about 5000 hogs.

HORTICULTURE.

W. N. Woodson, founder of the Maywood colony, advocates the planting of almond and fig trees and grape vines.

The Upland Citrus Association is erecting an elevated orange washing platform similar to the one in use at Duarte, which has proven successful.

During March deciduous fruit trees will be in bloom and during this time danger from frosts is always feared. So far reports are fine for the "setting" of a good crop.

Orange growers will have to stop picking for an indefinite length of time. The delay is occasioned by a shortage of cars that no one seems able to explain.—Citrograph.

The Imperial Press says that over 100,000 trees have been planted in the valley during the past sixty days. It also states that negotiations are nearly completed for the erection of a 1200-ton beet sugar factory, to cost $1,250,000, in that locality.

AGRICULTURE.

The Fullerton News says the cabbage crop from that section will be only about thirty cars this season, owing to the early drouth.

Two hundred acres of Egyptian corn will be planted near Chino by the Chino Land and Water Co. It is proposed to feed the corn with beet pulp to cattle next fall.

The Fallbrook Review advises those who have hay to sell to dispose of it now as the prospects are flattering for a fine hay crop. In that event the price of hay will be cut very considerably.

The Eureka Mfg. & Preserving Co. has increased its capital stock to $50,000. It has now in operation a large factory and expects before long to operate a cannery to can vegetables and fruits.

The vegetable gardeners around Alameda have begun suit against the Payne Smelter Works for damage to their crops. A peculiar feature of the matter is that, notwithstanding the alleged damage, the vegetable men have recently agreed to pay $100 a year more rent for the land than in the past.

Hay cutting at Imperial will begin about the middle of March. The average yield should exceed two and one-half tons per acre. The recent warm weather has forced the barley crop beyond the ability of the cattle in the Imperial valley to keep it from heading out.

Elwood Mead, professor of the Institution and Practice of Irrigation at the University of California, has just returned to California after a fifteen months' absence, during which he studied the irrigation and drainage systems of Europe and the United States, and his observation in regard to the needs of California is that the agricultural industry of California will be greatly benefited by an adequate drainage system.

At the meeting of the San Jose Farmers' club, held last Saturday, it was decided that the next meeting would be held at Sorosis in about two weeks. The subject for discussion at the meeting will be: "Resolved, That the farmer has nothing to say in determining the price of his products." It is expected that farmers from Saratoga, Campbell, Los Gatos and Cupertino will join in making the club meeting a success.

MISCELLANEOUS.

A boulevard is being constructed between San Bernardino and Colton.

A large number of pumping plants are being installed in Tulare county this season.

The San Jose Ostrich Company is a newly incorporated institution capitalized at $25,000.

Entries for the bench show of the Santa Clara County Kennel club will close April 15th.

The Womens' club is at work getting everything in readiness for the annual flower festival to be held at San Jose.

The complete form of a mastodon was found at Hillside, near Seattle, last week. The skeleton is valued at $50,000.

A meeting of citizens interested will be held March 12th, to aid in the construction of an electric road from Globe to Tulare.

Escondido wants a cannery. The last issue of the Times of that place advocates the moving of the idle cannery from San Diego.

A big dredger is at work along the river south of Napa building eight miles of levee to reclaim a large body of rich tule land.

The Fish Commission will send a man to Mexico to secure a large number of a new variety of quail, to be tested in country south of San Francisco.

The East Napa woolen mills are being refitted with new machinery, and by April first will be in operation. The capacity will be 200 comforters and 100 mattresses per day.

The notice of raise of rates by the Sunset telephone company at Vacaville has resulted in a heavy loss of patronage and the probable organization of an independent exchange.

President Moore of the National Good Roads Society is expected in California shortly and it is expected that two big "good roads" meetings will be held while he is here, one at Los Angeles and one at Sacramento.

The California Cordage Company, with manufactory and headquarters to be located at San Jose, has been incorporated. The company is capitalized at $250,000, mostly subscribed, and will at once commence the manufacture of cord.

The property owners in Perris valley have filed a suit demanding large damages from the Temescal Water company, it seems, because, as is alleged in the petition, the water company has drained the country of water and left the land dry.

A great system of water works is being surveyed to bring the waters of Pend d' Orille lake in Idaho to Eastern Washington, where more than a million acres of fertile land will be irrigated and made as rich as the lands in the Imperial valley.

At a meeting of the State text book committee held last week at Sacramento, State Printer Shannon was directed to manufacture 75,000 introductory geographies, 50,000 introductory histories, 50,000 grammar school geographies and 75,000 grammar school arithmetics.

The Manufacturers and Producers' Association of this State has in preparation a graphic exhibit chart to be displayed in the California building at the Louisiana Purchase Exposition at St. Louis, which will give a most striking and impressive presentment of the industrial activities of California. The chart will be about 10x14 feet in size. Its title will be as follows: "What Two Per Cent of the Population of the United States Are Doing in California—Industrial Statistics of California and of the Remainder of the United States Compared."

Ten thousand excursionists are scheduled to arrive in Southern California this month. Railroad officials say the rush is to be a record breaker and the heavy trains will tax the motive power of the companies to the utmost. It may be stated with certainty that of this army of tourists fifteen per cent will remain in the State as residents.

The Carnegie Library building at Santa Monica is rapidly nearing completion and it will be finished by the date required in the contract, March 20.

A colony of 544 persons is about to locate in Santa Barbara county.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

INCUBATORS.

Some of my sisters in the poultry yard are having trouble with their incubators and appeal to me for advice and help. It is usually the sad cry that twenty or thirty, or even fifty per cent of fertile eggs do not hatch out. Some say the chicks even pip the eggs but cannot get out. Others complain that even when the chicks hatch, a large number are crippled and have to be killed and some hatch out with one leg broken or dislocated.

I have been through all of this trouble myself, have studied and pondered and wept over them, poor little chicks, and finally I have, I think, discovered the cause, at least I was thoroughly satisfied in my own cases. The cause of cripples is invariably overheating of the incubator, either the heat has run up some time when not noticed, or the thermometer may be incorrect, one overheating may do it. If the eggs are overheated before the sixth day it is death to the germ, but why then, are not all the eggs spoilt, you ask? Because, in most machines, the heat varies in different parts of the egg chamber, so that all the eggs are not subjected all the time to the same heat. Some eggs also have thicker shells and are larger or smaller than the others. Those that die in the shell at or before the sixth day are usually rejected as infertile at the second test. Those that die from over heat later on are usually considered weak germs, but some grow to be great big chicks and yet cannot get out of the shell. (How one does regret their loss!) These come from too much moisture in the egg. The eggs ought to have been aired more and dried out more, so the chicks would have more room to turn themselves inside the shell, and would live instead of being smothered to death. The eggs both under hens and in an incubator require cooling and airing and turning at least twice a day. If you set a hen the same day that you start the incubator and examine the eggs of both, through the egg tester, you will learn a great deal and you can air them so as to keep both sets of eggs even. I did this and was surprised to find how much larger the air space became under the hen. I watched and sfudied most carefully and that is how I discovered what made my chicks die in the shells. I do not know the scientific reason for this, it may be also that the egg shells expand and contract, as most things do, by heat and cold, and that this expansion and contraction, the result of airing the eggs, breaks down the tough fibre of the shell, so that when the chick is due to hatch, it can break its way through. Or it may be that the air cell being larger, the chick can turn itself better, and so kick its way out, or it may be that the cooling and heating again of the shell makes it sweat, and that this gentle moisture is what the shell requires, but this I do know by sad experience that if the eggs have been insufficiently aired and cooled, and if the air space is, in consequence, too small, whether under hens or in incubators chicks will die in the shell.

By my own experience I have learnt that over heating (106 degrees is danger point) will kill the germ in the early stages, say for ten days; after that it will make cripples, "spraddlers," that have to be killed. Not airing sufficiently, or not having the ventilators open enough, or not drying out the eggs properly, will make chicks die in the shell and will hatch chicks sometimes with one (usually the left) leg out of joint. The poor little chick being cramped for space, dislocates its little leg at the knee joint. I would again urge every one with incubators to have their thermometers tested, so as to be sure they are right; it may save you many dollars worth of eggs and chickens. In this climate eggs do not require moisture in the egg chamber. I have tried it and smothered the chicks by it. If I thought moisture was required I would prefer floating the eggs in warm water (about 98 or 100 degrees) about two days before hatching time. I keep the ventilators open all day, close at night in cool weather to keep the temperature even, and keep them closed during the hatch.

* * *

ANSWERS TO QUESTIONS.

Balanced Rations.—Mrs. Basley: I have been an interested reader of your articles in the Cultivator on "feeding for eggs." As I understand them they refer to hens kept in yards or pens. Will you kindly give us an article upon feeding hens running at large in an orange orchard. Do they not find a balanced ration for themselves in a measure?—Subscriber, Claremont.

If your orange orchard is kept as clean as most of the orchards, there would be poor picking for the hens, not a blade of grass or even a leaf of weed, they will probably learn to eat the oranges and orange leaves. A friend of mine complained to me that the hens ate the lemon leaves and even lemons. "Poor things!" I exclaimed, "that shows they have no other green food." You will have to judge for yourself, if the fowls have greens enough; do they also have grain enough (three ounces per hen); as for the animal food, what insects or worms would they find? Here in the summer time there are none, the worms go deep down into the ground and the other insects disappear or dry up. A good way for you to judge would be to examine the fowls at night; their crops should be full when they go to roost; or a better way still would be to kill a hen at night, for dinner the next day, examine the contents of her crop, weighing it, and decide for yourself what your hens are eating and if they have sufficient or where they lack and supply the deficiency. Or you might try Dr. Nottage's plan, given in last week's Cultivator, of letting the hens balance their own rations.

* * *

Keeping Eggs.—Editor Cultivator: I would like information as to keeping eggs through the cheap prices for same, if there is any way that is practicable. If you know of any way, or know how I could obtain such information I would be very grateful to you for same.—A. C. B., Santa Barbara.

I, personallly, have tried in the last twenty years the following ways of keeping eggs—rubbing the eggs all

First-Class Incubators and Brooders

The "PACIFIC" is the most sensible Egg Hatching Machine yet invented and does its work perfectly without a nurse or night- watch. Send 4c for my 70-page Catalog No. 2. It tells all about them and has other practical matter on poultry raising, poultry houses, etc,, which makes the book worth a $ to anyone who keeps a dozen fowls.

Mr. Wm. B. Dean, Los Angeles. Stockton, Cal., Dec- 16, '03.
Dear Sir—Have just finished first hatch with my No. 1 Pacific and secured 52 nice, strong chicks from the 62 eggs placed in the machine. Never used an incubator before and am delighted with results, also with my incubator. Yours truly,
Mrs. A. N. Zumwalt.

White Leghorns, Black Minorcas, White Wyandottes and Barred Plymouth Rocks

Trophy Winners at Late Los Angeles Show

In each variety my fowls won a share of the regular premiums, and in some thirteen out of a possible twenty-five, or more than all competitors combined. My winning of First, Second, Third, Fourth and Fifth Premiums on White Leghorn Cockerels was the most striking success of the Show. The winning of the National White Wyandotte Club's Blue Ribbon for the best display of White Wyandottes was equally significant. But over and above all, the winning of the Times Eagle Trophy, the most coveted of all the prizes, awarded for the best display—numbers and quality considered—was the most signal and the most important victory of the entire Show. The handsome Cup offered by The Live Stock Tribune was awarded to my stock on the same grounds. These victories only add to an already long list. My fowls have received first premiums wherever exhibited. Over eighty premiums in the last five years.

My fowls are not only standard-bred, but utility-bred. Hundreds of customers attest their merit. They have proved their superiority both in the Show Room and as Breeders. There are no better fowls to be found anywhere, East or West. Both Stock and Eggs sold under absolute guarantees

Geo. H. Croley, Poultry Supplies

508 SACRAMENTO ST., SAN FRANCISCO, CAL.

over with a small piece of butter to fill and close all the pores, eggs keep fairly well for three months; the same by coating them with vaseline. Packing in sand, with the little end down, fairly satisfactory; placing in bran, same way, also in saw dust, unsatisfactory; in wood ashes, also unsatisfactory. Putting down in lime and salt solution, fairly satisfactory, if the lime is not strong enough to cook the eggs—and lastly, the liquid glass solution, which is thoroughly satisfactory in every way. The following formula of silicate of soda (called also "water glass" and "liquid glass") varying slightly in strength, was used with success in tests made at the Agricultural Experiment station of Rhode Island, North Dakota, Montana and in the Dominion of Canada:

Formula: Water glass (silicate of soda), one part; water that has been thoroughly boiled and then cooled, seven parts; mix the water glass with the water thoroughly, pour the solution over the eggs.

The proportions of water glass to the cold boiled water varied in the different experiments from one part water glass and five parts water to one part water glass and ten parts water. In the above formula I quote a happy medium and the one I tried myself a year ago with perfect success. All tests made at the experiment stations proved satisfactory, some eggs being kept ten months. In all the tests the eggs were placed in stone jars.

Last year on the thirteenth of March a neighbor and I put some eggs into the water glass, as an experiment and when we ate them at the end of eight months, found them in a state of perfect preservation. The eggs, when broken into a saucer, would stand up as if new laid; they were, in fact, perfect in looks, taste, smell and for cooking. I believe that eggs from hens kept without a male bird, and gathered fresh every day, placed immediately in the water glass would keep over a year and in perfect condition. The water glass does not stain the eggs; it makes them feel smooth and clean. Eggs, of course, must be clean when put into it.

The eggs I tested were placed, some in a stone jar, others in a five gallon tin oil can. Those in the tin did not do as well, as the tin rusted and discolored some eggs. Another year I would place them either in stone jars or small wooden kegs. The water glass cost seventy-five cents, at the drug store, per gallon. One gallon is enough to keep about seventy-five dozen eggs. A weight should be used, a stone on a board to keep the eggs down under the solution for, of course, if they come out into the air they will spoil.

I would strongly advise any one wishing to keep eggs to dispose of all the male birds, for when an egg is fertilized it has the small germ of life in it, when the egg is kept a certain time the germ dies, then there is death, the dead germ in the egg, which decays and a bad egg is the result. Eggs not fertilized keep much longer and have a much better flavor. So dispose of your useless roosters. Eggs should be kept in a cool place always.

HOW TO TREAT FOR HATCHING.

When receiving eggs ordered from a distance, do not put them under the hen or in an incubator immedately, but let them remain quietly for twenty-four hours, so as to allow all the fertile germs to recover their natural position, as the constant jarring on the cars or vehicle is apt to strain the fine fibres. By adhering closely to this a much better hatch can reasonably be expected.—James Hague.

POULTRY IN NORTHERN CALIFORNIA.

The present season for the poultry raiser promises to be one of the most successful ever experienced in Northern California. We find that the poultrymen, both those operating on an extensive scale as well as those working upon a more unpretentious basis, are hatching out more chicks several times over than ever before. This looks very much as though the poultry industry is assuming a very firm foundation, in fact all indications point toward this as one of the leading industries of the State. Its magnitude is not half realized by the public generally, yet statistics prove that there are actually more people interested in poultry than in any other of the industries pertaining to agricultural and live stock interests. Take, for instance, a drive from San Francisco or Oakland into the interior, and one will notice "chicken" ranches large and small on each and every side, and not only are chickens found in the rural districts and in the country, but many familes who have only one small city lot find it profitable to keep and raise a few chickens. We have been astonished recently at the number of people who have come to our notice who are able to pay their entire grocery bills from a small flock of 25 to 100 hens. Eggs are always in demand and a staple article everywhere, and the San Francisco market is one of the best in the world for eggs and poultry, the result being that poultrymen who are within a reasonable distance of the metropolis are able to market their poultry and eggs at the very best prices the year around. Fancy market eggs and dressed poultry bring splendid prices, and each year hundreds of people within a short radius of San Francisco are embarking in the poultry business. Of course, there are many failures, but these failures may be attributed to neglect and lack of the proverbial "horse sense" coupled with the very foundation so necessary—energy. To make a success of the poultry business one must give every detail close and careful attention, and neglect nothing, and when the work is systematized it is very pleasant, in fact a delightful business. We know of nothing which will bring such satisfactory returns on so small a capital as a "poultry ranch." Some five years ago a friend of ours started out with a capital of less than $200.00, thinking he could possibly make a living for himself from raising "chickens." He rented a small place of five acres, and bought 50 White Leghorn hens. He worked for neighbors the first year considerable, doing his own work at the same time, incubating and brooding all the chicks he could accommodate. The second year he had a fine flock of 300 pullets, and quite a little "apparatus" such as incubators, brooders, houses, yards, etc., for carrying on his business. He has now been in the business five years and has a flock of 1500 hens and is carrying on one of the most successful businesses we know of. It seems as though it requires less of his time to care for those 1500 hens than it does most people to take care of 200. He works regularly, but not hard as some people would consider the duties, and the best part of the bargain is that his bank account is growing most satisfactorily. Aside from selling eggs for market and securing the highest market quotations, he has a splendid business furnishing eggs for hatching to other breeders and realizing therefrom good prices. He is one who has made poultry pay, and pay well. We know of several others almost as successful, and hundreds who are do-

ROUP and CHOLERA

Why do so many so called poultry medicines fail? Because they are made to sell at 100 per cent and not to cure. Palmer Poultry Powder sells on its merits. Roup or cholera is no barrier to the poultry raiser now. Before this famous remedy was tested and its value proven the hatchet was used for roup. Now Palmer's Roup Remedies are used and the fowls saved.

PALMER'S POULTRY POWDERS

Trade Mark

You may think your fowls are healthy but do not lay. You buy egg producing food to force egg production. When your fowls are healthy nature fills the egg basket. Don't be deceived by cheap nostrums.

Palmer's Cholera Compound makes and keeps your hens healthy and vigorous and doubles the egg product. To try it is to buy it, to buy it is to make money.

ing well. Never in the history of this State has there been such a demand for high class, pure bred stock. Breeders report that long before the ordinary season was over for selling stock their supplies were exhausted, the early demand had been so great. We can attest to this fact ourselves, for we have shipped stock to nearly every section on the Pacific Coast, and find the interest in thoroughbred poultry on the increase everywhere. Many people are locating here from the East and taking up the raising of poultry as an occupation, for California offers the greatest inducements in this line.

Poultry shows held the past season have done much to create interest in poultry. People visit these exhibitions without any idea of ever becoming interested enough to raise any chickens themselves, but it is very often the case that just such people are struck with the chicken fever so severely that they go into the business for all they are worth, of course this creates a demand for the fancier's best product and at fancy prices. Such people do not always make a success of it, but those who think before they leap usually do. It pays handsomely to start with only the best stock money will buy. For instance, suppose one starts to raising chickens and pays $5.00 for a nice male bird, and $3.00 each for six females. This will give him a start and from the eggs this pen will lay he may raise 100 or more pullets the first season. If they are fine thoroughbred stock, he will have a handsome flock, and all he raises that he does not care to keep are the same breeding as the original pen and will bring a much better price than low grade stock. The original outlay for the pen of pure bred birds is nothing compared with the amount he will realize from his flock from keeping only thoroughbreds, over and above what he would for mongrels. This fact is demonstrated every day, and $20.00 or $25.00 outlay for a pen of six fine birds is the cheapest investment one can make. It pays to get only the best. A little difference in price should not influence one to take an inferior bird and use as a breeder.

Leading California breeders are preparing to send a carload of their choicest specimens of high class poultry to the St. Louis World's Fair next October, when it will certainly be proven to the country that this State is right in the front for producing the finest that grows. Those who are enterprising enough to exhibit there will certainly reap splendid returns, for California certainly produces some of the very finest poultry of any section in the country.

That California within a few years will be the greatest poultry producing State of the Union is the opinion of those who have watched the industry grow. We have the climate and almost every other advantage in our favor.—J. C. Williams, of Williams Bros., Fruitvale, Cal.

WATER FOWL CLUB OF AMERICA

At the annual meeting of the Water Fowl Club of America, held at Lincoln, Neb., January 20, 1904, the following members were elected to office for the ensuing year: James Hague, Oakland, Calif., president; W. R. Curtis, Ransonville, N. Y., vice-president; E. E. Smith, Lincoln, Neb., secretary, and M. F. Delano, Millville, New Jersey, treasurer; Chas. McClam, New London, Ohio; W. T. Stack, Kansas City, Mo.; J. L. Lamont, Whitewood, N. W. T., executive committee.

To the duck raisers who are strangers to our fancier's circle I extend an invitation to join us and assist to push forward the car of progress in water fowl culture. I hope that every one interested in water fowl who is not now a member of the club, may be able to see the advantages accruing to him as a member. For further information write James Hague, President Water Fowl Club of America, Oakland, Calif.

AN UGLY DISEASE WHICH CAN BE PREVENTED.

If there is a poultry house on the place in which hens were kept last winter that were affected with scaly leg, the hens that are put in confinement there the coming winter will have the same trouble, unless the house has in the meantime been very thoroughly cleaned and disinfected. More than this, if one of last year's flock remains, on the legs of which the traces of the disease are still visible, and is put back in the house with the others that have heretofore been free from the trouble, she will communicate it to the entire flock before spring. Scaly leg is easily cured in its first stages, but is hard to get rid of when it has become long established. It is an ugly disfigurement, and should be subdued at the start.—Farmers' Tribune.

BREEDING TURKEYS.

One good tom is enough for 10 hen turkeys. Too many hens, however, should be avoided. One union is sufficient to fertilize all of the eggs in one laying of the turkey hen, and hence it has been said that the number of hens to one turkey cock may be unlimited. The best breeders, however, find that as the number of hens allowed one bird approaches a dozen, the chicks show a falling off in constitution; and the number should therefore never be over a dozen. A tom may be used for breeding at 2 years old, and the hen at 12 months, but are not in their prime till a year older. A common mistake is made in mating stock that is too young. —Pacific Homestead.

Some two-year old hens have as much grit in their disposition as pullets have. Such hens, if active appearing, better be retained their second year. One New York hen is just reported as laying 263 eggs in her second year.

THE NATURAL HEN INCUBATORS AND BROODERS

Points of Merit That Are Causing Such Large Sales of These Machines All Over the U. S.:

A continual circulation of pure, fresh, warmed, moist air in every part. Chicks can regulate their own wants as to heat and air by having a range of from 60 to 100 degrees to go into. Chicks will not crowd, as they have warm material to place their backs against similar to the old mother hen. No chilling or overheating. Lamp fumes or gasses entirely separated from chicks and fresh air. Brooder can be heated up in fifteen minutes in any season. The most economical on oil of anything in the shape of a brooder. One filling of lamp—3 quarts of oil—will last from five to seven days in mild weather. The incubator is guaranteed to hatch chicks as strong as the hen can. The only brooder that has and is capable of raising 100 per cent, not only once, but time after time. Our catalogue and book combined will explain more of the merits that have made these machines famous. Send for it. Mailed on receipt of 10 cents in stamps. It has helped thousands to success that have previously failed with other makes.

Winner Buffalo World's Fair, Los Angeles, Oakland, Fresno

We won nearly every 1st, 2nd and Special on White Leghorns at Los Angeles, December, 1903. The greatest exhibit ever heldwest of the Missouri.

WHITE LEGHORNS

Our flock was formerly headed by the Prize Cock of the New York show, whose sire also won the first at New York the previous year. Of our bird, the judge said: "The best-shaped bird I ever saw; the finest tail and carriage I ever saw; the whitest bird I ever saw."

Among the choice leaders now of our flocks is Rob Roy, a most perfect specimen of extremely large, snow white birds, winner of 3 firsts at New York State Fair, and other prominent exhibitions. He is also a remarkable sire of prize winners. One of his cockerels is at present among the leading birds of the Eastern States. Romeo, a 7 lb., large, snowy white bird, winner of first at Madison Square Garden, New York's great show, and winner of first wherever shown, as well as being a remarkable sire. Similar remarks apply to Sunny Jim, a high-class large, perfect bird, from famous egg-producing strains of large eggs.

Best Strains, Best Birds, Greatest Layers, Largest Eggs, Up-to-Date in Every Respect.

None better. Lay more and larger eggs, 6 and not over 7 to the pound. Test yours.

To our flock of already choice birds, we have recently added some of the best birds to be found among the most famous flocks of the largest and best Eastern breeders, Selected not only for their Show qualities, but more essentially for their laying qualities of la ge eggs, which we have always made our strongest point in breeding or selecting. Among them is "WHITE ROSE," first pullet at Madison Square Garden, January, 1901; first prize pullet at Cortland, December, 1900; also winner of Golden Special for highest-scoring bird in Show, 96½ by Zimmer; also her two full sisters, and first prize hen, Snow Queen, at Madison Square Garden, New York, 1903. Judge G. H. Burgott says of her in American Fancier, Jan. 17, 1903; "A typical grand bird." Also others equally good from the same pen. and the prize cockerel at the Pan American World's Fair, (we having previously owned the prize cock and infused his blood in our young stock). We now place him as a splendid addition of new stock, and one of the most perfect speeimens of true type of large pure white Leghorns to be fonnd.

"The hens that lay are the hens that pay." Nearly all flocks of White Leghorns are the old small variety, layers of small eggs; our strain is snow white, large birds, bred for many years to lay more and larger eggs. Ours won many first prizes all over the East at biggest shows as well as Pan-American World's Fair. Such strains of White Leghorns give one-quarter more egg production, cost one-third less for feed and care than any other variety, while the large white eggs sell from 2c to 5c more per dozen. Buy a choice cockerel, the best in California, and improve your flock. Eggs for hatching.

W. W. HOWARD 3024 E. Main St. Los Angeles, Cal.

A new chicken-picker has been made which is said to possess merit, something the previous devices have not shown, it seems. In the future, it may be expected that all the big poultry agencies will turn over to their patrons chickens and other feather creatures which have been separated from their feathers by this new and highly sanitary device. The operation of the picker is easy. The fowl is placed on a sliding car or table directly beneath the "fingers" of the machine. The operator starts the apparatus and so moves the table as to bring every portion of the fowl beneath the fingers, which rapidly pick off the feathers. The latter are drawn upward by the other portions of the machinery and deposited in bags that are waiting.

The "Puritan Poultry Farm," Stamford, Conn., which claims to be the largest poultry raising plant in the world, does not bother to disturb incubator eggs by testing out the infertile. But they understand handling fowls so eggs are generally fertile. A fertile egg generates heat, an infertile does not. Do not, therefore, let thermometer lie on latter to mislead. Better use two or three thermometers as checks on each other. The clear infertile eggs, when thoroughly cooked, make good poultry food. Those which start to hatch and then die, decay and are only fit to feed hens that have the egg-eating habit.

Profit in poultry business—as in everything else—only comes as the result of good, steady, hard work and close application by those who known how to handle fowls. Every one must learn how to do this before he will gain a living therefrom. The best way is to start in a small way and gradually extend the business until it is as large as desired. And having mastered every little detail by having served an appreticeship at the same, one will eventually become master of the art.—Farmers' Sentinel.

The stunted pullet will sometimes be the first one to begin laying in the fall. She completes her growth some weeks ahead of her assocates, and as a consequence, the matronly instinct asserts itself the soonest.

The highest scoring female of the White Leghorn variety of poultry is said to be owned by a breeder at Waco, Texas. Her score is 97 points—the highest in the world. Hewes was the judge.

IDEAL TRAP NEST.

The above illustration is one of the most simply constructed, cheapest in cost, and at the same time most effective. It can be constructed of empty soap, fruit or oil boxes, by anyone handy with tools. It is an entirely new form of closure or trap, a patented device, to take the place of a trap door. This attachment consists of two parts only, is made from wood and attached to the nest box by two screws. That is about all there is to it; there is no inner box. No tripping door. No inclined platform. No string, spring, pulley, rubber, roller, hinge, wire, weight or chain, but simply two pieces of wood of original design, secured to the box by two screws operating more simply and entirely unlike any other trap nest. These trap nests enable you to cull out all unprofitable birds, and thus from the good ones left breed up in one season a valuable flock of far better layers and better birds with high egg records. W. W. Howard of 3024 E. Main street, Los Angeles, is handling this trap and reports best of results with it.

FEEDING HORSES.

In feeding horses very few stop to think that their stomachs are small and that they cannot stow away as much forage as ruminating animals of their size, but notwithstanding this, most farm horses have their racks stuffed with hay two or three times a day—getting all they will eat. It is a fact that this produces an uncomfortable distention of the stomach, flatulence, indigestion, weakness, laziness and sometimes founder. As a rule it is cheaper and every way better to feed horses less hay and more grain. It is the height of folly for any farmer to scrimp the allowance of oats and stuff the horse with hay.

While twice a day is often enough to feed ruminating animals, horses should be fed three times. Cattle have large storage capacity. They can bolt the food as fast as they can wad it down and afterwards regurgitate it and masticate it at their leisure. But the horse, not having this power, requires to be fed often and less at a time. A work horse should not be fed hay at noon, as he must carry it around all afternoon undigested. At noon feed him a good allowance of grain only. He thus gets the requisite amount of nutriment in a more concentrated form. About 14 pounds a day is all a horse should have. Make the rest of his ration some kind of grain. Feeding too much hay often causes heaves. Liverymen have generally learned how to feed work horses. They give very little hay, some none, but a small quantity of straw to add bulk to the ration of grain.

Few stockmen in their feeding operations take into account the widely differing structure of the stomachs of ruminants and horses. In the former the stomach consists of four divisions, whereas the latter has but a single sac. As a result of this difference, digestion with a horse is a much simpler matter mechanically than with a cow, though chemically the results are similar. The stomach of the horse is but slightly called into action during the digestive process, and provided the food be properly masticated and incorporated with the salivary secretions, it is arrested for a short time only in the stomach, but is passed onward into the intestinal canal, where the process of digestion is completed. In the stomach the food is brought under the action of the gastric juice only. On this account the intestines are more liable to disease. A surplus of easily digested food is apt to derange the small intestine; whereas food containing much woody fibre, such as over-ripe hay, coarse straw, etc., accumulate in the large intestine and causes derangement, inflammation, and even paralysis of the intestinal tissue. Boiled or steamed food is retained in the stomach too long and causes distention. Such food is not prepared for intestinal digestion. This elementary knowledge of the anatomy and physiology of the stomach of the horse should suggest to the feeder that a large digestion of hay or coarse fodder of any kind by the horse will result in disorders of the digestive organs.

Experiments have been made which show that horses have a "uniformly lower digestive efficiency than ruminants." The horse dissolves less crude fibre than the steer or sheep, and this peculiarity is more marked in the case of the crude fiber of fodder crops than in grains. The horse on an average retains his food in the digestive tract 4 days or less; cattle 3 or 4 or 7 or 8; sheep or goats from 3 to 4 days with ordinary rations to 7 or 8 when straw is eaten. That food is actually more finely divided by ruminants in chewing and digestion is indicated by the mechanical condition of the manure. In sheep manure the undigested residue is in smaller fragments than in that of cattle. Since crude fiber is chiefly digested by the action of bacteria, the longer the materials remain in the digestive tract the greater the opportunity for action of such micro-organisms.

	Horse.	Cow.
Average capacity of stomach	19 qts.	266.9 qts.
" " " small intestine	67.4 qts.	69.7 qts.
Average capacity of large intestine	137.4 qts.	40.19 qts.
Average length of small intestine	73.6 ft.	150.9 ft.
Average length of large intestine	24.5 ft.	36.3 ft.

—Iowa Homestead.

ANNUAL MEETING OF THE JERSEY BREEDERS.

(Continued from first page.)

as thereby will be secured vigor, constitution and procreative powers, size, lung expansion, and full round body, with strong heart action, are much desired in a bull to head the herd. We should look to beauty as well as power in the sire and especially so in Jersey stock. Quality and beauty may be united in an animal. Seek to breed up all the time, for neglect tends to backward breeding."

"Organization" was discussed by Mr. James Boyd. In this strong paper he showed clearly the benefits of organization to accomplish results in the work before the Jersey Breeders' Association. This paper will be produced

E. E. Moore, of Compton, talked briefly of the mistakes of Jersey breeders. In this address he supported the doctrine laid down by Prof. Major in many essential points, and showed clearly the necessity for care, capacity, and management in successful breeding.

Dr. Hassen, late member of the Legislature, suggested the methods to be employed to secure needed cattle legislation. "Awaken the interest of your member and senator," he said, "and if your bill has merit follow it from the committee to which it is assigned until it comes from the executive with his signature of approval." Mr. Boyd followed this talk with the observation that much can be done along this line by enlisting the sympathy of Farmers' Clubs, and cited the passage of several bills at the last session of the Legislature advocated by clubs throughout the State. Organization also will materially assist in obtaining needed legislation.

Mr. Campbell spoke of the value of advanced registration as a means of advancing the interests of the association in this part of the State. He advocated the value of an examining committee whose work shall be, at stated times to make tests, examine herds, and report to the secretary their findings, so that a local herd book may be kept and the performances of individual animals made a matter of record. Mr. Miller supported this suggestion and stated that advanced registration is now permitted by the American Jersey Cattle Club, when kept in two classes, "A" and "B". The association, after passing a vote of thanks to Prof. Major and the people of Buena Park for courtesies, adjourned to meet at Orange the second Tuesday in March, 1905. The meeting, while not largely attended, was very interesting.

Guy H. Miller, of Riverside, has presented the State Polytechnic Institute at San Luis Obispo with a young Jersey bull—Prof. Bruce King—son of officially tested cow Signora Bruce, as a starter for the Institute herd.

CLEANING TEST BOTTLES.

Those who have operated the Babcock test have experienced the difficulty of keeping the test bottles clean after they have been used some little time. C. B. Moak of the Minnesota Agricultural college says on this subject:

"In a glass or earthenware jar make up a solution of one part bicromate of potassium to twenty-five parts of sulphuric acid, and shake or stir well so as to dissolve the bicromate of potassium. As soon as the solution has turned slightly pinkish it is ready and may then be used or may stand indefinitely without injuring it except that it will weaken unless tightly corked.

"In using, only a small amount need be placed in each bottle, and in handling one should handle this with great care as it is apt to spatter.

"After adding, shake the bottle for some time so that the sides will have been completely washed, and then allow to stand for a short while, and then again shake. After the second shaking empty the solution back into the receptacle, as this can be used over and over again for the same purpose. After the bottle has been emptied rinse with water from three to five times, and then wipe dry with a cloth. After carefully using this cleaning solution upon any glassware you will find that it looks nearly as clean as when it first came from the manufacturer."

THE WASHING OF BUTTER.

Those who have made the subject of butter making a life study always wash butter with cold water, says Fannie M. Ward in the Epitomist. We think it best to add a little salt to the water used for washing. Butter that is inclined to be soft is certainly improved by washing with cold water—it makes it firmer. As Miss Hess says in the special dairy number, it is difficult to wash a lump of grease—so the right time to cleanse butter of the milk is before it is churned into a mass of grease. The churn should be stopped when the butter is in a granular condition. Then the buttermilk may be drained off and the butter evenly washed and salted without spoiling the grain. We consider it important to wash butter thoroughly with pure, clean cold water, keeping it up until the water coming from the butter ceases to have a milky appearance. However, the care of the cream beforehand is of more importance than washing, methods of salting, working, etc. There is no way to improve butter that is off flavor when it comes from the churn. Washing won't help it; bad butter soon becomes very bad, no matter how careful and cleanly it is packed.

CARROTS FOR HORSES.

John Williams, a reader of the Cultivator, urges the advisability of raising carrots on a large scale to feed horses. He says he has been experimenting on this vegetable for several seasons, feeding it to his horses, and that he has had excellent results therefrom. The value of carrots as a food for horses is not so well known and recognized as it should be. Four or five pounds of carrots may be fed daily to a working horse with decided advantage, and a limited quantity may be fed to road horses. They serve to keep the digestion in tone, and act very beneficially on the digestion of other food. Carrots are easily grown and every farmer should make a point of raising some for feeding purposes. We have frequently heard of the value of carrots for cattle when fed in small quantities and regularly with meal or bran. The best results are obtained when the carrots are cooked.

SALT THE BUTTER ENOUGH.

While in the office of a butter dealer this week, the writer was asked to urge the butter makers to salt their butter more. Many lots are too lightly salted to bring out the flavor, he said, and it would improve them from one to several points. Looking into this statement further by a visit to a number of other dealers, it was learned that the complaint was general—much of the butter was too light in salt. Therefore now proceed to be urged and see that the butter has enough salt in it—but first be sure whether you are among those who need the urging. It is worse yet to go too far the other way. You know how it is with beef stock when the cook forgets and puts on another handful to make sure, or how much is it they do use?—Chicago Dairy Produce.

REMARKABLE RECORD OF A JERSEY BULL.

The bull of the Jersey breed that leads all others in the number of tested daughters is Exile of St. Lambert. Ninety-four of these have made records of over fourteen pounds of butter a week. He is said to have been a bull of great vigor and vitality, and retained his vigor up to the very day he died, at 13 years of age. This bull had for a dam Allie of St. Lambert with a record of twenty-six pounds, twelve ounces of butter in seven days, and full sister to Ida of St. Lambert, with a test of over thirty pounds per week. He was exercised in the following manner: A good strong post was firmly fixed in the ground and stayed on four sides. Across this a strong pole of hickory about twelve feet long was attached by means of a swivel. Exile was secured to one end of it by a chain from his nose to the pole, which was weighted down at the other end to balance it. He took his exercise in a circle.

As prepotent a Jersey bull as there ever was is still alive in King of St. Lambert's King, owned by F. W. Hart of Cleveland, O. He was by King of St. Lambert, the sire of twenty-six tested cows, and out of his own daughter, Elsie Bonner. I never enjoyed a day much more than one spent looking over Mr. Hart's herd, and especially looking at this bull, his mother, and daughters, and last, but not least, a young bull showing vigor to spare, sired by King of St. Lambert's King, and out of his own dam.

Of the well known Guernsey bulls, Lily's Bonny Boy, owned by Mr. N. K. Fairbank, Lake Geneva, had 41 registered daughters, and 13 of these at least have made 343 pounds of fat in a year, and Lily Ella and Lilyta made in official tests 782 and 710 pounds of fat respectively. This bull was out of Lily of Fernwood, 22 pounds, 11½ ounces of butter in a week, and one of the best cows of the breed. He received his exercise by daily work in a tread power to run a separator.

The Guernsey bull having the second highest number of tested daughters was also owned in Wisconsin, and was Benjamin 1931. He had 25 registered daughters and nine of them have records ranging from 349 to 508 pounds of fat in a year, and ten of them have made weekly records ranging from 12.02 to 17.7 pounds of fat. He was exercised twice daily in the tread power, and proved a good sire until he was 9 years old. He was never as vigorous as some bulls, due, I think, to poor care when he was about a year old. His dam, Tricksey, was in 1888 first prize cow at the Wisconsin State fair, and made 2 pounds, 7¾ ounces of butter in one day. Mr. S. C. Kent, who imported over 1000 Guernseys, says she was the best cow he ever owned. —Chas. L. Thill.

DANGER TO THE HORSES.

"Do you mean to say you didn't give that horse-thief by jury?"

"We didn't dare," answered Bronco Bob. "If anything as unusual as a trial took place the whole town 'ud turn out to see it, and some one would be sure to sneak in and steal some more horses."—Washington Star.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE, CAL.

NATIVE PALMS.

G. E. P., Pomona: California has but one native palm—the U. S. has seven—names and ranges as follows: Royal palm (Oreodoxa regia) which is found in southern Florida, and also in the West Indies and Central America. This palm is too tender for any but the warmest spots in our State and even then our climate is too dry for its perfect development.

The Sargent palm (Pseudophoenix Sargentii), is a very rare palm from the southern Florida Keys, and is said to have little horticultural value—we have never seen a specimen, so cannot tell if it would thrive here, but probably not.

The Mexican palmetto (Sabal Mexicana) extends quite a distance into southwestern Texas. It is quite hardy and grows well with us, but very, very slowly.

The Cabbage palmetto (Sabal palmetto) of the south grows along the Atlantic coast from North Carolina to Florida, in which State it also grows on the Gulf coast. It is perfectly hardy in California, but grows slowly under any method of treatment.

The Silvertop palmetto (Thrinax microcarpa) and the Silktop palmetto (T. parviflora) are both from the southern Florida Keys and do not seem to be at home with us. Our climate is too cool and dry, no doubt.

Washingtonia filifera is the scientific name of the California Fan palm which is so extensively planted all over the State. Its range is that part of the Colorado desert lying between San Bernardino and Yuma. The first ones encountered in a trip eastward over the S. P. R. R. is near the station of Seven Palms, though great numbers may be found in the Palm, Andreas and other canyons near Palm Springs. This palm is known to do well in its native State, but like all others, it thrives best when well supplied with water. The U. S. Government botanists have given this the hideous name of Neowashingtonia, but other botanists seem to take no notice of it, for which all patriots, especially Californians, should be thankful.

The Public Roadways.—The temptation to say something occasionally about public roadway improvements is too strong to resist. It may be considered by some a hackneyed and threadbare theme, but that does not detract from its importance, nor deter the journalists and magazine writers from hammering away until the public mind shall be fully aroused to the necessity of taking some definite action. Not only have the press become active again in the discussion of this matter, but the governors of many of the States have recently embodied strong recommendations in their messages favoring legislative aid in the improvement of the country roads. Every county should have a "Good Roads Association," or "Highway Improvement Club," for the purpose of promoting the work of road building. The State Road Association of Illinois was instrumental in having the present road and drainage law of that State enacted. As one of the beneficial results of the enforcement of that law, land values have doubled, because the farmer can now reach the shipping points easily and readily at such times as he may choose to sell. He can take advantage of the market when it is best for him, regardless of the weather. He is saved much time, much wear and tear of wagon, team and patience. Good roads broaden the way to a better development of the country and tends to relieve the congestion of the centers of population. Good roads lead people out of the cities. They make the country more populous and more popular.

Mr. Brownlow, of Tennessee, has had a bill before Congress for some length of time, which provides for aid by national legislation. It provides for an appropriation of several millions of dollars, but the expenditure could not be better applied and the source it comes from will serve to knit the ties of the Union more firmly if possible. It is the best form of public beneficence that has been suggested. All California should urge our representatives and senators to support the measure, and should also prevail upon our State Legislature to make provision for an amount of money corresponding with our pro rata share from the Federal Government, to be used for the construction and maintenance of good roads.

Small Packages In Favor.—The steady advance in popularity of the apple box over the barrel is the subject of a timely discussion in the Chicago Packer on the evolution going on in the ranks of consumers. As the Packer forsees the future, the barrel will have to go, and in its place will come the box with its convenience in handling and its freedom from unsanitary conditions. In another decade the barrel will seldom be seen as an apple package. This may sound radical, but viewed from an unprejudiced, disinterested position the change is practically a foregone conclusion. Even apple packers, the hardest element of all to convert, will not submit continuously for several seasons to what they had to face the past fall in western New York, where apple barrels were held at times as high as 40 to 50 cents. At many points local coopers "held up" packers for 55 to 65 cents. At such prices the use of barrels become false economy when the standard box can be had for 12 to 15 cents.

Not only were the apple men caught by the barrel shortage, but the cranberry men as well. This was marked in the Jersey cranberry deal where at times barrels were to be had only at famine prices. Thousands of boxes were packed and shipped to the large markets where they were assorted and repacked in barrels.

* * *

Continuing the discussion as to the availability of the apple box as a package for shipment, the Packer says: "The use of the box package for apples is rapidly growing, as one can see at a glance in any large fruit house today. Where nothing but barrelled fruit was shown a few years ago, a box package being practically unknown except in California fruit, today long tiers of boxes with their lids thrown back showing from 24 to 36 in the top layer are a common sight. The fruit salesman will tell you that it is far easier to sell 50 boxes of fancy goods than the same quantity in barrels. Where the retail grocer is practically the only customer for the barrelled goods, the consumer himself is now being seen in the wholesale district. A box of apples is not beyond his pocketbook, he has been educated up on oranges by the box and takes to apples like a duck to water, especially if the fruit is fine and of regular size. He will balk on a barrel of Jamaica oranges but will take a box, a barrel of apples he will never consider."

There is a suggestion in this connection which it will be well to bear in mind; the nearer the original packages can be made of the same size, which will sell as it comes to the grocer and the consumer in turn, the more rapid will be the distribution of any product.

Herein lies the secret of the success of the small package movement. What applies to staple products still more forcibly rules in the matter of perishables. Experience has proven the utility of the small package. Wherever it has been exploited it has won its way. It is, as the Packer well says, "a time saver, a labor saver and in the end bound to win."

THE FUN AROUND A FARM.

Let others grieve, as grieve they will, the
lonely lot and solemn,
Monotonous existence that a farmer has
to live.
And funny scribblers fashion stories, col-
umn after column,
Upon the round of lonely life the home-
stead has to give.
I'll still believe, in spite of these, there's
happy days and cheering,
To occupy a fellow's thoughts and keep
him out of harm,
And backed I am in this belief by memories
endearing—
There's lots of sunshine here and there,
and fun around a farm.

If rumor you would appreciate you must not
be dyspeptic,
Your liver needs must well perform its
functions every day,
It must not ever enter opposition diamet-
ric
To your enjoying happy things that chance
to come your way.
And since there's so much gout in town
and chronic stomach trouble,
And long-drawn faces quite enough to
summon up alarm,
I cannot help but say, although I prick
some writer's bubble
There's more of sunshine here and there,
and fun around a farm.

The height of fun is measured by our
powers of enjoyment,
I say, and healthy livers set that measure
pretty high!
A hearty laugh's for vocal chords a mighty
good employment,
A lively tune's the best of things to time
one's labors by;
There's too much of stooping over desks and
counters in the city,
There's too much hollowness of chest and
flabbiness of arm,
Too little joy—too much of close air and
stuffy—more's the pity;
While, oh, there's sunshine everywhere,
and fun around a farm.—Roy Farrell
Greene.

A NATURAL MISTAKE.

Really, Gifford was not at all to blame for it. Anybody might have made the same mistake. Gifford was short and fat and new to the big woods. He had been in camp a week and had spent most of the time lying in a hammock and reading a novel while the other men tramped the trails and rowed through Eagle creek to Vir-gin or Lake Julia. Everybody said that Gifford was too fat and lazy ever to make a woodsman.

But that was before Miss Shurtleff and her mother came to the camp. They had a log cabin next to the big cook shack, and it was announced that Mr. Shurtleff would come to join them later. The young woman was tall and athletic looking, full of life and eager to see and do all there was to be seen or done within twenty miles of Big Lake.

Perhaps it was intentional—at any rate Gifford got mixed up in the introductions. But that was nothing against him. Anybody might easily have made the same mistake.

Gifford fell desperately in love with the younger of the two women at first sight. And his new love transformed him. He became all at once the most enthusiastic oarsman and wood tramper of the party. It made a hero of him. What would have terrified him before he now gladly undertook.

One evening, when everybody in camp was sitting under the birch trees watching the sunset, a curious animal as large as a small dog ran shambling down in front of the shack and tried to hide under a pile of logs. Gifford and Gifford's Irish terrier, both entirely new to the woods, were up and after it in a minute.

"O, what in the world is it?" cried Miss Shurtleff. "Do you suppose that it is dangerous?"

Gifford would show her he knew not the meaning of fear. He ran directly toward the beast, which, badly frightened as it was, made but poor progress over the sand.

Gifford's dog was even before him. It attacked the animal with open mouth. But it made but one bite and then began to roll over and over, yelping with agony. "Look out!" called one of the guides. "It's a porky hog. Better not touch it."

But with Miss Shurtleff looking on Gifford would have attacked a raging lion. He raised a club he had picked up from the ground in his right hand, and with the other grasped the beast by the back. But, like the dog, he did not keep his hold. His hand felt as if it were full of hot needles, and from his heroic lips came a groan of pain.

But even that was worth while, for his sufferings called such expressions of tender sympathy from the red lips of his divinity that Gifford would gladly have embraced another porcupine. Tommy, the guide, pulled barber quills out of Gifford, who bore the pain like a Spartan and then performed a similar operation on the dog, which, for the remainder of its stay in the woods, absolutely refused to go within reaching distance of anything that had life.

Doubtless Gifford would have discovered his mistake earlier if the two women had not persisted in always remaining together. Doubtless also there was a conspiracy to keep him in ignorance of his mistake, though no one believes that Miss Shurtleff or Mrs. Shurtleff was a party to it. And the fact that two women called each other by their first names—Anne and Julia—prevented his making the discovery in that way.

With his left hand done up in a bandage to soothe the pain of the porcupine quills Gifford became more than ever the slave of the young woman. She, on her part, was kind enough to him, though she seemed anxious that he should pay attention to the older lady rather than to her. And Gifford obeyed her commands and waited on the ancient person assiduously. Once the old lady announced that she would like to drink some milk, fresh and warm from the milking, and Gifford, at a look from Miss Shurtleff, volunteered to get up every morning at four o'clock, when Tommy milked, and get the milk for her. That was heroic, for Gifford liked better than most men to lie abed late in the morning.

Every day, when he could persuade them to go, Gifford took the two women out rowing or fishing or exploring. Before they came to camp he had been too lazy to go out on the water unless Tommy pushed the boat, but now he was always ready to row a boat containing both Miss Shurtleff and her mother any number of weary miles, while Tommy, with a smile hidden under his brown mustache, came skimming along behind, with nothing but the lunch basket in his skiff.

When you consider that Gifford's arms were short and thick, that his wind was bad and his hands tender, and he had never done rowing before that summer, you may begin to realize the power of love. Big blood blisters came on the palms of Gifford's pudgy hands, and he suffered almost continually from pains in his back and legs, but not for a moment did he ever think of giving up the battle. Miss Shurtleff expressed an admiration for water lilies; Gifford waded out in ten inches of water and two feet of mud to get them, greatly to the damage of his footgear and trousers. Miss Shurtleff casually remarked that the great hairy woodpecker must be a curious looking bird; Gifford, fat and round, climbed a forty-foot pine stump, and took a young bird out of its nests to show her. Incidentally the stump broke as he was coming down and Gifford fell into the creek. Fortunately the creek bottom was good and soft.

The climax came on Saturday. Tommy, the guide, precipitated matters the night before.

"Mr. Shurtleff is coming Sunday morning," he said.

Gifford started as if he had been shot. In the more than two week's which had passed since Miss Shurtleff came to the camp he had never once had an opportunity to speak with her alone. And now her father was coming. For some reason Gifford felt much afraid of Mr. Shurtleff, though he had never seen him. He was anxious to reach some sort of an understanding with the daughter before the old man put in an appearance. Only one day remained in which to make the attempt. Gifford's back ached and his arms were sore; his hands were one mass of blisters and his legs pained him at every step. But he was game.

"What do you say to a little row down to Big Dog lake?" he asked airily that Friday evening after supper. Big Dog lake was a good twelve miles to the south. Altogether the trip meant a row of twenty-five miles.

"I'd like to go," said Miss Shurtleff, "but it's a terribly long row."

"Not at all," said Gifford, and Tommy, the guide, retired to the porch and laughed noiselessly, with one hand over his mouth.

"I'll take you in my boat," said Gifford desperately, "and—"

"No," interrupted the young woman, "I think we'd better go together. We can both go in Tommy's boat and you can—"

"Not at all," said Gifford; "I will row you both, of course, if you prefer to go together."

They started at five o'clock in the morning. Gifford felt sure he should faint before they covered the first five miles. But he gritted his teeth and kept on, though every stroke was agony. He had laid out his plan of campaign. He would wait until they landed for luncheon, and then make an opportunity to speak to the young woman alone.

Luncheon time came. Gifford ate almost nothing. When they had finished their coffee he started to walk back into the woods. Presently there came the sound of a cry.

"Come here quick," Gifford was calling. Tommy, the guide, must have been posted beforehand. At any rate he did not move. But the young woman was up in an instant, running back through the wood's trail as lightly as a fawn. The old party sat still on her cushion—which was as Gifford had expected.

Gifford wasted no time.

"Miss Shurtleff," he began abruptly, "I love you and I made this chance to tell you so."

"What?" said the startled young woman.

"Miss Shurtleff, I love you," again declared the red-faced Gifford. And

Nobby
Sack Suits

The new loose-cut sacks, designed for men who want to keep a little ahead of the procession, are either very swell or the reverse—depends on how they're tailored.
Ours will bear the most critical inspection of men who have the custom-tailor habit—the quality of the cloths, the character of the cut, the careful, painstaking tailoring are above reproach.

The Call of the Hen

A Visit to the World's Largest Poultry Farms

BY A. R. COULSON

PART II.

In last issue we told about C. H. Purvine's poultry farm and the thousands and thousands of young chicks that Mr. Purvine is raising on Coulson's Chick Food. Also about the mammoth incubators that just hatched out 6000 more chicks that will be raised on Coulson's Chick Food and all these incubators and some others are filled again and about the middle of March will bring out about 13,000 or 14,000 chicks at one hatch.

After leaving Purvine's place, as we were driving along the road, we overtook a man with a six-horse load of Coulson's Food. (See illustration.) We asked the teamster where he was going with that big load and he said he had on 70 sacks of Coulson's Food, 35 sacks of Coulson's Little Chick Feed, and 35 sacks of Coulson's Egg Food for the hens, and he was going to Wm. Bassett & Co.'s poultry farm and that they got a load like this every three or four weeks.

As Mr. Bassett's place was only about one-half mile ahead from there, we concluded we would like to stop and see Mr. Bassett, so we drove in. Although it was after one o'clock when we got there, Mr. Bassett insisted upon us having a lunch and set before us a dinner fit for a king, which we ate with great relish, especially the cream and butter, for Mr. Bassett has a fine creamery and they milk 90 cows.

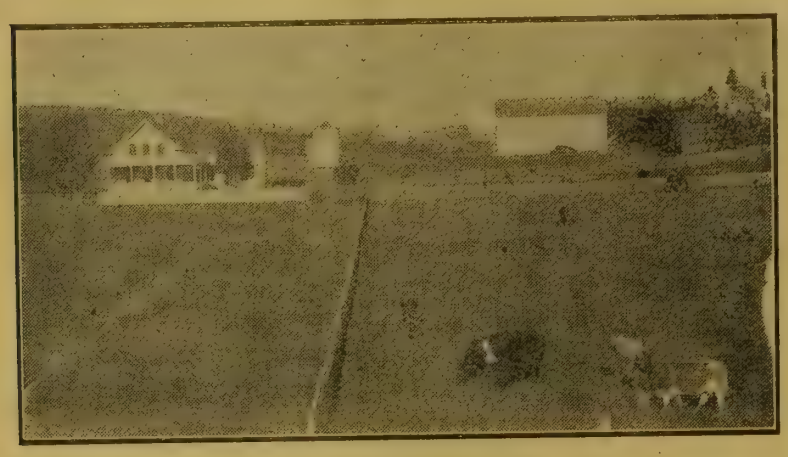
After lunch Mr. Bassett took us out and showed us ten brooder houses and yards containing all told about 6000 little chicks that he was raising on COULSON'S CHICK FEED, and he said they consumed about 1½ sacks a day of it; that COULSON'S CHICK FOOD was the BEST FOOD for little chicks; that they thrived well on it and kept strong and healthy.

About 2000 of these little fellows were only about three days old and the rest about one week old, and they were certainly a spry, healthy looking lot of chicks and you ought to see them eat Coulson's Chick Food.

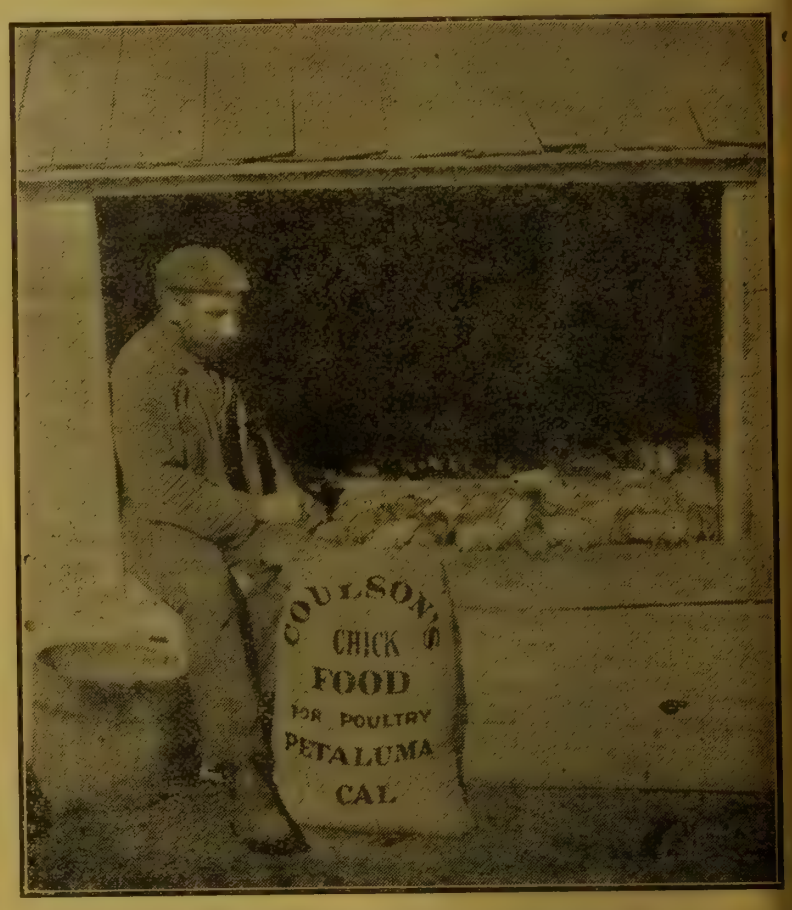
Then Mr. Bassett showed us the incubator house containing incubator holding about 3000 eggs which would hatch out in about two weeks a couple thousand or more chicks that would be fed on Coulson's Chick Food the same as the rest of the little chicks.

After this we took a walk over a couple of hundred acre of land looking at some of their fine White Leghorn hens. These hens are kept in colonies of from 300 to 500 hens, and 2 or 3 acres run are given each colony. Altogether they have nearly 3000 laying hens, and they consume about 2 sacks of Coulson's Balanced Ration Egg Food to a meal and they lay from 1200 to 1500 eggs a day.

Now, this dairy and poultry farm is 14 miles from Petaluma and contains a little over 300 acres of land and is owned by Wm. Bassett. Wm. Bassett's nephew, whose name is also Wm. Bassett, has one-half interest in the poultry which they have been raising for the past 6 years and so profitable has it proven that the younger Mr. Bassett has purchased for himself a fine place of 100 acres which he will stock with poultry and make a modern up-



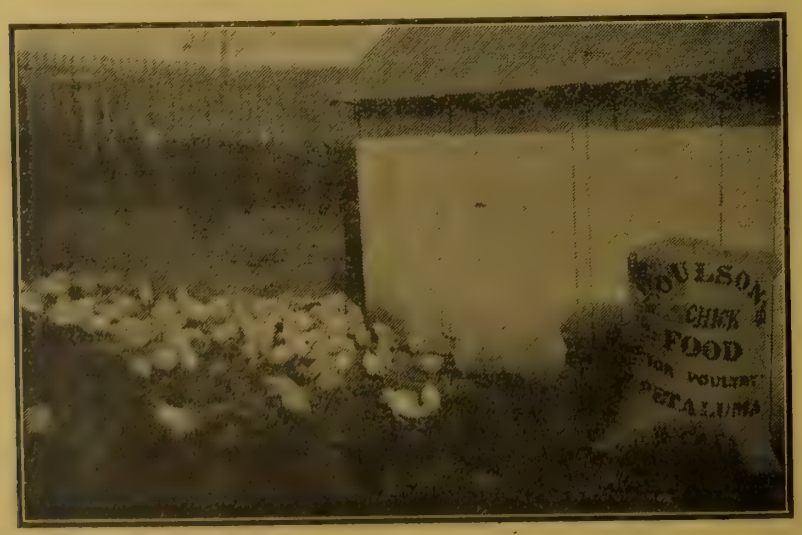
Birdseye View of Wm. Bassett's Residence.



A Window that slides open in the side of brooder house; 600 little chicks in the house. Mr. Bassett, Jr., feeding them Coulson's Chick Food. Notice how busy they are eating it; some of them go right into the sack and help themselves.

Scene on the Road 14 Miles from Petaluma. A Six-Horse Load of Coulson's Food, (35 Sacks of Coulson's Chick Food for Little Chicks and 35 Sacks Coulson's Egg Food for Hens), about Three and One-half Tons Going to Wm. Bassett's Poultry Farm.

Another brooder house containing 500 little chicks about 1 week old. See them eating Coulson's Chick Food. On Wm. Bassett's pla



One Lot of Brooder Chicks Eating Coulson's Chick Food on Mr. Wm. Bassett's Place.

Six Weeks Old; $3.75 a Dozen

Mr. Bassett sold 600 roosters SIX WEEKS OLD that were raised on Coulson's Chick Food for $3.75 per dozen. It is wonderful how Coulson's Chick Food makes chicks grow.

Scene on Wm. Bassett's 300-Acre Poultry Farm. The Hens are Kept in Colonies of from 400 to 500 and a Run of 2 or 3 Acres is Given Each Colony.

ate poultry farm.

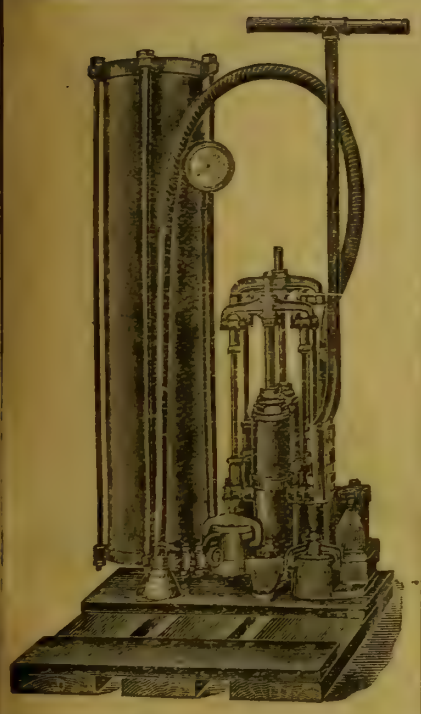
The moral of this story is, if you re raising any poultry, you want to o like the larger and successful poulrymen; raise your little chicks on 'OULSON'S CHICK FOOD and feed he laying hens on COULSON'S EGG 'OOD and you will have success and ake more money out of your poultry.

Remember an egg contains 16 per ent protein while wheat and corn and ill feed contain only 10 per cent, consequently the hen has to eat double the amount of feed to get the other 6 per cent protein. Coulson's Egg Food contains as much protein as an egg contains, so by feeding Coulson's Egg Food you get more eggs with less feed.

Ask your feed dealer or send to factory.

A. R. COULSON.

The next issue of this paper will show an 800 acre poultry farm where Coulson's food is bought by the carload, "and chickens"—A FEW!



SAY!

Are your trees covered with moss or scale so that they can't get a healthy growth? You are sure to have small fruit from unhealthy trees. Instead of 6 per cent you will make 300 per cent on the money invested in a thorough spraying of your trees. But if you use a cheap squirt gun pump you may as well pour the material on the ground and save your time. Use a good pump and do a thorough job and you will get results all right. Our

BEAN TORRENT

is the pump to buy. We haven't space to tell about it here, but send for circular giving full description of all our goods. We can also send you a book of formulas free. Did you ever try a Bean Clipper Nozzle? Address a postal at once to

BEAN SPRAY PUMP CO.
SAN JOSE, CAL.

BAKER'S

TRACELESS HARNESS

No Whiffletrees—No Traces

This harness is indispensable to every fruit grower—vineyardist or orchardist. Saves time, labor and patience. Pays for itself many times over every season in the saving of injury to trees and vines and damage to growing fruit, which always occurs from the use of ordinary whiffletrees and traces. One of the handiest of farm equipments.

We have hundreds of testimonials from every State, like the following:

Sunland, Cal., December 27, 1902.

SIRS: In regard to the Baker Traceless Harness which I purchased from you, I wish to state that when using it on the team among my trees, I know of no improvement which can be made on the outfit unless I cut the legs off the horses. It is impossible to injure the trees or fruit while using it.

Yours well satisfied, T. G. CUSHMAN.

Sebastopol, Cal., March 29, 1902.

DEAR SIRS: Your harness is all you represent it to be in every particular We judge it a big success for plowing vineyard and orchard.

Yours very truly, C. D. HAMILTON

Don't delay—write us to-day for illustrated catalogue of this valuable harness, mailed free for the asking. Live agents wanted everywhere.

HOOKER & COMPANY, 16-18 Drumm St., San Francisco, Cal.
Sole Agents For California.

Los Angeles Markets.

Los Angeles, March 10, 1904.

The local market has shown but few variations during the last week. The city dealers, generally, are quite well satisfied as to the outlook for supplies during the coming season. Provisions in nearly all lines are freely offered. Demand is good at the following quotations:

Butter.

Butter suffered a decline of 10c per 2-lb. block as a result of the last Creamery Board of Trade meeting, There is a still lower tendency due to the increasing supply at the producing centers. Just how long these conditions will prevail, is due largely to weather and the outlook for pasturage.

B. of T. Cream', 2-lb roll		60
So. Cal. Dairy, do	50	52½
Cold storage	42½	45
Cooking, per lb	18	19

Cheese.

The storage supply is large and on account of decline of butter, a lower quotation is expected.

Cal. and 3 lb. hand	18
Cal. Downey and Anchor	17
Swiss	19
Imported do	28

Eggs.

There has been a still further decline of 2 cents per dozen on fresh ranch eggs, being quoted at 17 cents flat.

Fresh ranch	16	17
Store, case count		15

Poultry.

Poultry is still reported very scarce, by the local dealers, there being but few offerings at these high prices. This is the time of the year when there is money in the production of eggs. There is a fair supply of eastern stocks on hand which are in good demand, and it is thought that the trade will be satisfied until the young poultry becomes more abundant.

Spring chickens, per lb	20	22
Hens, No. 1, per lb	14	15
Ducks, per lb	14	15
Turkeys, per lb	20	22
Turkeys, cold storage	22	23

Live Stock.

Prices remain firm at last week's quotations. Best beeves are in very good demand.

Hogs, per cwt	5 50	5 62½

Lambs, do	3 00	3 50
Wethers, do	4 25	4 50

Potatoes.

Potatoes are holding firm at last week's prices. Seeds are quite scarce, especially Early Rose. It is reported that the new crop will be very late.

River, per cwt	1 60
Oregon, do	1 75
Local Sweets, white	3 00
Early Rose seed	2 25
Pinkeye, do	1 60
Nevada Pearls, do	1 60

Vegetables; Mixed.

Notwithstanding the fine conditions of the new crop, the prices quoted are held firm. The supply is abundant and of a very good quality. The demand is cleaning up most of the supplies in a satisfactory manner. The local dealers have been notified that the new California Rhubarb Association will handle the entire output for this season. The opening price will be $2.50 for forty-pound boxes. All the rhubarb is practically grown in a radius of about ten miles of San Lorenzo, consequently local dealers will have to sell at 2.75. It is felt that the consumption will be limited at these figures.

Onions, yellow per cwt	2 50	3 00
Nevada, fancy do		3 00
Beets, per 100 lbs		1 25

Walnuts, soft shell	14	14½
Walnuts, hard shell	13½	14
Peanuts, eastern	06	07
Peanuts, California	05	05½

Hay and Grain.

Hay has taken a firmer tone during the past week, there being but few small lots offered. The continued scarcity of rain has again had a tendency to slacken the movement and unless there is rain within the next few days, to insure the farmers of a new crop, it is thought that the prices will retain the former high mark and even go higher. The late hot winds have damaged the crop quite materially.

Grain will no doubt hold firmer in sympathy with other feeds. Prices range as follows:

Alfalfa		15 00
Tame oat	15 00	16 00
Barley hay	15 00	16 00
Wheat hay	15 00	16 00
Wheat	1 35	1 45
Barley	1 12½	1 15
Oats	1 25	1 35
Corn	1 25	1 30

Mill Stuff.

Quotations f. o. b. cars L. A. are:

Rolled barley	1 30	
Bran	1 30	
Feed Corn Meal		1 50
Middlings		1 45
Cracked Corn		1 45

Chicken Wheat		1 65
Cocoanut Meal		1 50

San Francisco Markets.

San Francisco, March 10.

Dairy.

Receipts of butter show increase and the outlook is favorable to further heavy shipping, but as only a small percentage of the arrivals scored in the strictly fancy grade, values for this quality were well sustained and holders of the favored marks were firm in their demand for the outside quotation.

Eastern .....Nominal

Poultry runs light this week and prices remain firm. Some variation from last week's quotations are noted.

POULTRY—Old Roosters, per doz., $5@5.50; young Roosters, $6.50@7.50; Fryers, $5.50@6.50; Broilers, large, $5@5.50; small, $4.50@5; Hens, small, $5@6; large, $6.50@7; Ducks, per doz., old, $5.50@6.50; young, $6.50@7; Live Turkeys, per lb., 16@18c; Dressed Turkeys, per lb., 20@22c; Geese, per pair, $2@2.25; Goslings, $2@2.25; Pigeons, per doz., old, $1.25@1.50; Squabs, $2.25@2.50

Fruits and Vegetables.

The heavy rains of the past two days caused oranges to suffer to some extent. The market, however, for choice and standard Navels exhibited a steady undertone at sustained prices and with the ceasing of the rain a fairly active movement was noted for local accounts. Retailers took the better quality offerings, which are now running to a high score, while the lower class stock was well cared for by peddlers.

DECIDUOUS FRUITS.—Apples, per box, common to choice, 50c@$1.25; fancy, $1.50@1.75.

CITRUS FRUITS.—Per box: Oranges, Navels, fancy, $1.50@2.25; choice, $1@1.50; standard, 75c@1.25; acording to size; Seedlings, 50@90c; Lemons, $1@2.75; extra, $3; Grape Fruit, $1@2.50; Tangerines, 75c@1.25; Limes, $6@6.50.

VEGETABLES—Asparagus, per lb., extra, 12½@15c; No. 1, 9@10c; No. 2, 6@8c; Tomatoes, per box or crate, southern, 75c@$1.50; do, Mexican, $1@1.50; Rhubarb, per lb., 6@8c; Green Peppers, per lb., 15@25c; Dried Peppers, Stockton, 5@8c; southern, 8@12½c; String Beans, per lb., 10@15c; Wax, —; Green peas, per lb., Bay, 6@8c; do, southern, 4@6c; Egg Plant, per lb., 20@25c; Summer Squash, per box, $1@1.25; Cucumbers, hothouse, per doz, 75c@$1.25; Mushrooms, per lb., 10@20c; Garlic, per lb., 5@7c; Dry Okra, per lb., 12½c; Marrowfat and Hubbard Squash, jobbing at 2@3½c per lb.

POTATOES—Per ctl: River Burbanks, $1.05@1.15; Early Rose, $1.25@1.35; River Reds, $1@1.10; Garnet Chile, $1@1.10; Salinas and Lompoc Burbanks, nominal; Oregon Burbanks, $1.20@1.40; Nevada, $1.40; Petaluma and Tomales, $1.10@1.20; Sweet Potatoes, $2.65; New Potatoes, per lb., 2½@3c.

Hops.

The price for new crop is 25@30c per lb, according to quality.

Beans.

No change to speak of in prices of beans. The market is slow and holders manifest little interest in parting with their stock.

BEANS—Prices, per ctl: Large Whites, $2.65@2.80; small do, $3@3.25; Pea, $3@3.25; Lima, $3.30@3.40; Red, $4@5; Pink, $3.20@3.40; Bayo, $2.50@2.60; Blackeyes, $2.05@2.25; Kidneys, $4.75@5.

Live Stock.

Hogs are in sharp request and with available supplies barely adequate to trade wants, the market is stronger and higher prices are quoted for the hard grain-fed offerings of desirable weights. Cattle are also in strong demand and keep well cleaned up at full current rates. Other live stock is as last quoted with the movement of good volume and the market displaying a firm undertone.

CATTLE—No. 1 Native Steers, 9@9½c; second quality, 8@8½c; thing Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4@5½c; Bulls and Stags, 3½@4½c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4¾@5½c, gross weight; heavy, 4@4½c, gross weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs., and over, 5¾@6c; weighing under 130 lbs., 5½@5¾c; weighing 250 to 300 lbs. 5@5½c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

HAY—Per ton: Wheat, $16@18.00; Wheat and Oat, $15@17; Oat, $15@17.50; Barley, nominal; Clover, $13@14.50; Alfalfa, $13@14; Stock, nominal.

STRAW—Good to choice, per bale, 60@75c.

OIL CAKE MEAL—In lots of 20 tons, $29.50.

CRACKED CORN—Choice quality, per ton, $29@30.

FEED CORN MEAL—Choice grades, per ton, $29.50@30.

GROUND BARLEY—Per ton, $23@24.50.

COCOANUT CAKE—In lots of 10 tons, $22; 5 tons, $23.50; less quantity, $24. Prices are mill rates and are subject to change without notice.

Cereals.

FLOUR—Net cash, Family Extra, $4.80@5.15 per bbl.; Bakers' Extra, $4.60@4.80; Oregon and Washington, $3.65@4.50.

WHEAT—No. 1 Shipping, per ctl., $1.38¾, choice, $1.41¼; White Milling, good to choice, $1.43¾@1.55.

BARLEY—Choice No. 1 Feed, $1.06¼@1.10; off grades, $1.03¾@1.05; Brewing, No. 1, $1.11¼@1.20; Chevalier, nominal at $1.20@1.40.

CORN—Good to choice, per ctl; California, new, large Yellow, $1.37½@1.45; small do nominal; White, $1.37½@1.45; Eastern, $1.30@1.40.

CRACKED CORN—Choice quality, per ton, $29@31.

OATS—Good to choice White, $1.27½@1.40; Red, $1.30@1.35; Black, nominal at $1.27½@$1.40.

RYE—Good to choice, per ctl., $1.30@1.32½.

WOOL.

There is no material change in wool.

Fall clip, per lb: California Plains, 6@8c; Foothills, 8@10c; Middle Country, 10c@12c; San Joaquin Lambs, 8@10c; Northern free, 11@12c; do, defective, 9@10c; Humboldt and Mendocino, 11@13c; Nevadan, 10@13c; Oregon, Valley, spring, 17@18c; Eastern, do, 10@14c.

Eastern Markets.

Grain and Produce.

CHICAGO, March 9.—Comparatively firm English markets, notwithstanding the weakness in Chicago yesterday, caused wheat here to open with a considerable show of strength. May was ¼ to ¾ higher, at 92@92½, and July was up ½ to ⅝ at 88½@88¾. These were the top figures of the day. Prices were sustained for a time near the level by a prediction of a cold wave extending as far south as Nebraska. After the first installment of buying orders had been filed, however, the market began to sag gradually. The downward tendency was accelerated by the extreme weakness which developed in coarse grains under heavy liquidation. The market rallied under a fair commision-house demand, and shorts covered freely, forcing up the price of May and July to about the top figures.

Cash quotations were as follows: Flour was quiet and weak; No. 2 spring wheat, 88@92; No. 3, 82@92; No. 2 red, 93@97; No. 2 corn, 49@50; No. 2 yellow, 50; No. 2 oats, 39¾@39¾; No. 3 white, 39¾@42½; No. 2 rye, 60@62; good feeding barley, 38@40; fair to choice malting, 45@55; No. 1 flax seed, 1.08; No. 1 Northwestern, 1.14; prime timothy seed, 3.00; mess pork, per bbl., 13.15@13.87½; lard, per 100 lbs., 7.10@7.15; short ribs, sides (loose), $6.87½@7.12½; short clear sides (boxed), $7.15@7.50; clover, contract grade, 11.65.

DAIRY MARKET.

On the Produce Exchange today the butter market was quiet and easy; creamery, 14@23½; dairy, 13½@21; eggs, steady, 17@19½; cheese, steady, 10½@11½.

Dried Fruits, Nuts, Etc.

NEW YORK, March 9.—The market for evaporated apples is firmer, with demand good, and holders inclined to ask higher prices; common, 4@5¼; prime, 5¾; choice, 6@6½; and fancy at 7. Prunes appear to be meeting a little better demand, and rule steady at from 3½@6½, according to grade. Apricots are in limited supply, both here and on the Coast, and are firm; choice, 9¾@10; extra choice, 10½@10¾; fancy, 12@15. Peaches firm; choice, 7¼@7½; extra choice, 7¾@8¼; fancy, 9@10.

CITRUS MARKETS

The orange market has shown stronger tendencies this week, owing, in part, to improvement in the weather. A better tone pervades the eastern orange market as a whole and the outlok is better than for some days back. Florida oranges are about gone. For fruit is cleaning up rapidly and the general feeling is that an improved market is in sight.

VETERINARY DEPARTMENT

BY DR. W. J OLIVER,
109 No th Broadway, Los angeles

POSSIBLY GLANDERS.

Editor Cultivator: I have a horse that commenced running at the nose about two weeks ago and his nose is sore wherever the discharge touches him. The discharge is mixed with white specks. The horse feels well and looks well. What shall I do for him?—W. H. O., Covina.

Your horse shows symptoms of glanders. Have him examined by a competent veterinary surgeon.

KIDNEY DISEASE.

Editor Cultivator: I have a cow about ten years old, too weak in her hind parts to get up. She eats hearty and seems well in every other way. This is the fourth day she has been down and last night she had a nice large calf, but rather poor and couldn't get up nor stand for several hours. Can you oblige by telling through the Cultivator what to do for the cow?—F. A. E., San Luis Rey.

Give the cow the following and she will soon get on her feet. Nit. potash 3 ounces; nux vomica powder, ½ ounces; mix. Give dessert spoonful 3 times a day. You can give this rolled up in paper like a ball, or give in solution in bottle.

USE A NOSE PREVENTATIVE.

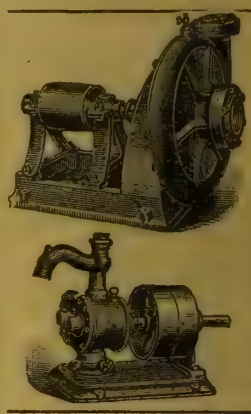
Editor Cultivator: Would you kindly answer through the Cultivator if there is any remedy to break a cow from taking her own milk. Have been milking a heifer six or eight months and in the meantime have tried different things but all to no avail, among them, by putting a strap over the nose studded with nails, a stick attached to halter and belly girth; also, three horse collars about the neck, none of these prevent her, and thinking some of the many readers of the Cultivator have had a like experience I would be deeply indebted for information to cure her—R. J. B., Ventura.

There is an arrangement made the shape of the nose attached to a ring in the nose, that hangs down over the upper lip that is said to be effective. This does not interfere with their feeding and would be worth trying.

DIABETES.

Editor Cultivator: Have a mare twelve years old, in good condition, but she is continually passing water twelve or fourteen times a day. Can you tell me the cause and cure in Cultivator? She drinks lots of water and eats well.—T. H. H., El Cajon.

This is a case of diabetes. Change the feed; give iodine tincture, one tea spoonful night and morning; increase the dose if necessary after 3 days. Stop the medicine gradually as soon as relieved.



GOULDS' HORIZONTAL CENTRIFUGAL PUMPS
RUN LIGHTER AND TAKE LESS POWER TO OPERATE AND PUMP MORE WATER THAN ANY OTHER STYLE CONSTRUCTED ON THE MOST MODERN DESIGNS.

A NATURAL MISTAKE.

(Continued from page 259)

then Miss Shurtleff's face broke into a smile.

"Why, my dear man," she said, "I am Mrs. Shurtleff. Julia, there on the bank, is my step-daughter, and the only Miss Shurtleff that I know of."

Poor Gifford's face was purple.

"You see, my husband is thirty-five years older than I am. But I'm not angry with you. In fact, you've paid me a great compliment. But I thought you knew all the time."

Mrs. Shurtleff wanted her step-daughter to help her row back to camp in Tommy's boat, but Gifford would not listen to it. He was game to the end. He left the camp that night and went back to Milwaukee. He didn't care to wait and meet the aged Mr. Shurtleff.—Chicago Tribune.

A NEW STORY OF JOSEPH JEFFERSON.

The man who drove me from the little hamlet of Buzzard's Bay along the three-quarters of a mile of winding road to Crow's Nest, Joseph Jefferson's summer home, was a bit of a philosopher in his way.

"I've lived some sixty-odd years in this vale o' tears," he said, as we plodded on in the misty rain, "an' I've l'arned one or two things. One is thet the bigger a man is, the clusser ye can approach him."

He gave the horse a fleck with his long whip, and continued, meditatively, "T'other day a man come over to my place opposite the station. 'Me good man, he said, haughty-like, 'hev ye a hoss?" I hed. 'Git it out at once,' he went on. 'I think I'll let ye drive me down the road a bit. But ye must be quick, as I ain't used to waitin' much.' His manner riled me, an' I told him my hoss was busy. 'Busy?' he said, an' drew up his head half a foot higher. 'Thet can't be. Trot along, me man, an' git out yer rig. I'll give ye a dollar fur the afternoon.' It was so funny I laughed in his face. 'Ye are a fool,' I said, an' went into the house.

"Thet same day another man come along. I was cleanin' this buggy, an' the man stood an' watched me. 'How dye?' he said. 'Fine day, ain't it? How's the missus? I see ye have some fine turnips growin' over there. Good year fur turnips, ain't it? Got some myself thet promise well. Ye ought to see 'em. When ye are up my way drap in, an' I'll show 'em to ye.'

"'I will, Mr. Jefferson,' says I. A while later I l'arned thet the other feller was a butler fur a family on the other side o' the bay. It beats all, the difference between people, don't it?"—January Woman's Home Companion.

A DEFERRED RESTITUTION.

A pig belonging to a widow named Murphy mysteriously vanished one night, and Pat Hennessy, a ne'er-do-well, was suspected of having had something to do with its disappearance. He denied all knowledge of the pig, however, and as there was no evidence against him he was allowed to go free; but at Mrs. Murphy's instigation, the priest went to see him.

"Pat," said the priest, "if you've no fear of the law in this world, at least give a thought to the hereafter. When you're before the Judgment Seat, what are you going to say about that pig?"

"Shure, I dunno," replied Pat. "Will they be after askin' about th' pig in Purgatory, yer Riverence?"

"They will," said the priest.

"Will Mrs. Murphy be there, yer Riverence?"

"Yes, Pat."

"An' th' pig?"

"Yes, Pat."

"Shure, I'll wait an' give it to her thin, yer Riverence."—February Woman's Home Companion.

RECIPES

Eat Little, but Have That Little Good

Deviled Chicken.—Two cups finely chopped cooked chicken; 2 tablespoons butter; 2 tablespoons bread crumbs; ½ cup cream; 2 hard boiled eggs; 3 drops onion extract; 2 tablespoons chopped parsley; salt and pepper to taste; melt the butter, add the bread crumbs and cream, stir until the mixture is heated; add the eggs (the yolks and whites passed through a seive), the parsley and seasoning. Mix well, take from the fire, put in shells or individual dishes, cover with greased bread crumbs and brown in a quick oven. Curry powder, paprika and other seasoning may be added at will.

* * *

French Toast.—Several slices of bread may be dippd in th following mixture and fried in butter, making a nice dish for luncheon: 1 egg, 1 cup sweet milk, a little salt. This may also be served at dinner, instead of fritters, with fruit syrup or jelly poured over it.

* * *

Macaroni and Cheese.—Wash 1-3 pound small French macaroni, cook in boiling water until tender, drain and add 1 pound finely cut cheese, ½ teaspoon salt, a little pepper, a dash of red pepper, a pinch of mustard, pour over it a cup of milk, put over the fire and stir until the cheese is well melted. Butter a baking dish, put in the macaroni with bits of butter and slices of cheese on top. Cover closely until time to bake. It is better to prepare this the day before it is wanted. Before putting in oven pour over a little more milk and bake from ¾ to 1 hour in a moderate oven. Send to table in the dish it is baked in.

* * *

The water that is used for tea and coffee should not be alowed to boil long before using.

WHAT MAKES A LADY.

Every girl is ambitious to become a lady.

The most noticeable feature about a real lady is that she never makes herself conspicuous in the slightest degree. She dresses, talks, walks and acts quietly. You cannot tell her a block away, because she is dressed so modestly and appropriately that she is not conspicuous.

She never adopts flaring hats and gaudy colors, simply because they are the fashion; she never laughs so loudly that people turn to look at her, and she tries to cultivate "that most excellent thing in woman—a soft voice."

The very best thing you can do, girls, is to behave and look like a lady.

To be a true lady means to be a good many things. It means modesty, gentleness, self-control and thoughtfulness for others' welfare.

Try to realize that it is better to be ladylike than to be "stylish" when to be the latter means that you must wear a ridiculous hat and impossible shoes.

All men admire and respect the woman who is a lady as well as a woman. They know that if she is a lady in the truest sense of the word she is gentle, and there is not a man living who does not love gentleness.

When you find your voice and laughter growing loud and attracting attention, just pause and ask yourself: "Am I behaving as a lady would?" When you are choosing your clothes, avoid conspicuous effects.

Be a lady in looks as well as actions. —Beatrice Fairfax.

A GORDON ANECDOTE.

The late General John B. Gordon used to tell the following incident as a pretty good joke on himself:

Not long after the Civil War the general and a number of friends formed a co-partnership for raising stock and for trading in land. The business office and the general's home, for the time, were near the banks of Flint river in Georgia, and the style of the organization was The Flint River Land and Live Stock Company.

Mrs. Gordon had not favored the enterprise and had endeavored to dissuade her husband from participation in it, but failing in this she "lay low and said nothing." A few months after the beginning of the venture, one of those heavy freshets, for which that region of Georgia is famous, came on, the river spread in width from its hundred yards to half a mile or more, and the flood submerged nearly all the land and drowned most of the cattle, etc., of the company. One day, while the general and his wife were standing on a porch and viewing sorrowfully a floating procession of animal carcasses that swept past, Mrs. Gordon spoke up and said:

"General, isn't your firm called 'The Flint River Land and Live Stock Company?'"

"Yes, my dear," was the reply, "but why your question?"

"Well," said the lady, "I was thinking that a more appropriate name just now would be 'The Flint River Water and Dead Stock Company.'"—Ex.

A farmer presented himself at a rural school, dragging an overgrown youngster reluctantly through the door. "This here boy's after an eddication," he explained. "What d'ye teach here?" The timid teacher replied that she taught history, grammar, reading, arithmetic, algebra, trigonometry—"That'll do," interrupted the farmer. "Load him heavy with triggernometry. He's the worst shot in the family."—Ex.

Dining Car Service Unequalled

"For the past three years it has been my good fortune to come across on the first Santa Fe Limited from Chicago to Los Angeles, each time having with me some members of my family. In trying the various routes across the continent, I have found no service better or the treatment of the employes more courteous.

The accommodations this year on the Limited train are certainly all that can be desired, and both the service and quality of the meals furnished on the diner surpass, in my opinion, any dining-car service on any other railroad east or west."

E. M. LYON,
Of I. L. Lyon & Sons,
Redlands, Cal.

Culture of the Strawberry

By Dwight Griswold, Tropico

In all the field of cultivation there is none other among the small fruits that has more to interest or greater diversity of methods of cultivation than the strawberry; different soils and different localities call for different varieties and different treatment to obtain desired results; but there are some things that apply to all localities and to all varieties, and no one has yet combined into successful practice all the best things of the various methods used, or obtained uniform results from any particular plan pursued.

The condition of plants, and the weather following their planting will often upset the best calculations that are based upon former results.

We will only touch briefly upon the various points that seem to us to be of the most vital interest to those engaged in strawberry growing and trust to subsequent discussion to elaborate as much as may be needed.

In that section of the State where I have the pleasure of living the business of raising strawberries has become one of great importance and profit, and is carried on with a degree of intelligence and careful detail that has earned for the locality of Tropico a deserved reputation for the finest strawberries grown anywhere in the State, and as fine as those produced anywhere in the entire country.

In preparing the ground for planting, care should be taken to have five or six inches of thoroughly pulverized surface upon a good firm subsoil; soil that is loosened, and open to a greater depth than this, requires more water for irrigation and gives greater trouble in firmly setting and starting plants. In fact, our observation would lead us to prefer a soil but little disturbed to one that has been broken up to a great depth.

When making final preparations for planting the field should be free of all weeds and any refuse that will prevent getting a smooth and well graded surface. All labor expended with that object in view will be repaid many times over in better and more satisfactory planting, cultivation and irrigation.

Except on ground that has been impoverished by heavy cropping, we have never found commercial fertilizers of much benefit, and would hesitate to use anything in that line except pure blood and bone. After the first year on vines that have borne heavy a good dressing of stable manure, or a compost of several kinds can be applied in the fall to good advantage, and vines so treated will generally bear well the fourth year out; but stable manure worked into the soil will almost without exception call for more water, resulting in rank plants and berries of very poor quality.

In planting several methods are used in laying out the beds, either in single or double rows, according to the nature of the soil and the results to be obtained in a given time.

Single rows are to be preferred in a soil that packs or bakes, while double rows give the best results in a sandy or porous soil where the water penetrates quickly and the surface does not crust. When we do not plant for runners or permit them to fill in the rows, we use from 40 to 100 thousand plants to the acre planted level and in rows eighteen inches apart; in planting for matted rows only 10,000 to 12,000 plants are set to the acre, in rows two feet apart; from this last way of setting no returns should be expected the first year and all such obtained will be at the expense of future profits.

All the labor should be done by hand, weeding, cultivating, furrowing; it is far more effective and just as cheap as horse power.

From the time the plants are first out until the bloom has set, they should be kept thoroughly cultivated and in a thrifty condition; then close and deep cultivation should cease and the soil be kept moist by more frequent cultivation and light soil mulching.

Fifteen Acres of Strawberries.

Plants do well planted at any time from January 15th to October 1st; the time of planting should be governed by the results wished to be obtained in a given time.

Experience has demonstrated that plants set as early as July and August, as a rule, will not fruit until the following spring, in April or May; while plants set in September, with favorable weather and good care, will fruit in November and December. These early set plants all bear heavy crops of fine berries the first year, making but few runners and those late in the season.

Plants set in January will generally give fair crops the first year and make plenty of sets, while those set later, up to April first, make rapid growth, few berries and abundant, strong, early runners.

The best method to obtain a satisfactory fall and winter crop is to hold over plants by bedding out in nursery form; these should be set out in August and be kept well irrigated and thoroughly cultivated. These plants will generally commence bearing in October or November, and continue fruiting until frosts come.

We have had in an exceptional season, such planting continue fruiting for fifteen months, during which there was not a week that berries were not picked for market.

While there are several varieties of strawberries that do well in our locality, the Brandywine has proven itself much superior to all others that have been tried, both for length of season and profitableness. Its large size, perfect form, deep brilliant color, eating and shipping qualities, makes it a general favorite, as its almost exclusive planting shows, and justifies the reputation it has of being the best strawberry grown anywhere in the State.

Whatever the variety planted, care should be used in the selection of the stock and only strong, vigorous plants be used, for it takes more care, labor and expense in every way, except in the first cost of plants, to raise fruit from weak, degenerate stock, while the net returns are cut down one-half.

If fresh eastern plants cannot be obtained it is better to get plants from a distance and from soil of a different nature; good plants will do better the fourth year out than poor plants will the third year.

Continuous replanting will be of interest to those of small holdings who wish to keep in the business of strawberry growing; soil of a good quality, containing plenty of humus, can be replanted without giving it rest by adding a moderate amount of pure blood and bone; our own experience has shown that excellent results can be obtained by such replanting, though reports coming from most sections would indicate that the practice is not generally profitable.

The preparing of the fruit for market has probably received more attention in the section about Tropico than anywhere else in the State; and if it is worth while to raise strawberries, and good ones, it is certainly worth while putting them up in the best possible shape for market. When picked they should be immediately taken out of the sun and wind; the grading should be done in the field and the packing and final crating should be done in the shade with the least possible amount of handling.

Far better work will be done by the hour than by the piece; any berry that will not reach the consumer in good condition should never be put in for market.

Tell your pickers and packers to reject all fruit such as they would be unwilling to eat.

We find it a good plan to put the grower's name in each basket on a slip of paper; it helps the grower, if his goods are right, and protects the consumer from imposition.

There is a good market in the far eastern cities for berries from October to January, but unless the shipper is willing to take the utmost care in selecting and handling the berries before starting them on their long journey, nothing but loss and disappointment need be looked for.

We have found that a registered trademark helps to distinguish and give reputation, for when you feel that you have a good thing it is easier to persuade others that you have such.

From the time you start to prepare the ground until your berries are in the hands of the consumer, if you wish success, you must study every step in the process and meet the necessities and conditions as they appear.

Simple as the growing of strawberries may seem, you will find it an occupation that calls for active, intelligent effort.

NATIONAL CO-OPERATIVE CONGRESS.

Alonzo Wardall, chairman of all industrial and commercial co-operative societies in the United States and Canada, has issued a call for a convention to organize an American Co-operative Union. The call is in part as follows:

"All Industrial and Commercial Co-operative Societies in the United States and Canada are invited to participate in the organization of an American Co-operative Union; the congress for that purpose to be held on the World's Fair grounds at St. Louis, June 16 and 17, 1904, and representation to be as follows: Each local society, either affiliated or non-affiliated with other societies, to be entitled to one delegate; and each general organization of such societies, either State, district, or national, to be entitled to five delegates; one vote to each delegate, and no proxies.

Delegates should bring credentials signed by the proper officers of their societies.

The purpose of this congress is to form an unincorporated federation of the industrial and commercial co-operative societies of America for educational and organization work, to promote our business interests, and to arrange for holding annual congresses.

Under the head of Industrial Co-operative Associations are included all forms of agricultural organizations, shipping, fruit, cheese, buttter, etc."

Mr. A. H. Naftzger, of Los Angeles, is the member from California on Committee of Arrangements.

ITEMS OF INTEREST.

We Feed the World.—The figures just given out by the bureau of statistics, now a part of the department of commerce, for flour exports in 1903, are especially interesting at this time. The total is considerably larger than for any preceding year, showing the importance the wheat industry has attained in the commerce of the world, and the further fact that not only does America lead the world in raising wheat but in manufacturing it into bread. The statistics exhibited by the bureau referred to, in round numbers, show the total exports for 1903 reached 20,000,000 barrels of 196 pounds per barrel. The value of the flour exceeded that of any preceding year, with the exceptions of 1892 and 1893, but the quantity exported was materially less. The exact number of barrels of flour exported from the United States in the fiscal year 1903 was 19,716,634, valued at $73,756,404, while in 1893 the number of barrels was 16,620,339, but the value was $75,494,347, prices of that year being materially higher.

The fluctuation of prices in the export of wheat has been due to poor crops in Europe, principally, but with few exceptions from 1880 to 1903 the output of wheat has steadily increased, the percentage of last years' crop which was exported being as 54.5, compared with 17.5 in 1880. These figures are, in every way, phenomenal, for they indicate how rapidly America is advancing to the certain position of the foremost wheat producing country in the world. Other countries have, in times past, produced in a single year more wheat than this country; but the significant point in the matter is the uniformity with which the producing power in America has been maintained, as well as the growth of the wheat and flour industry. We shall soon be able to supply the world with both wheat and flour, even if the per cent of gain in the wheat crop is not materially increased.

* * *

An Important Decision.—The recent decision of the Supreme Court at Washington upon the merger case of the Northern Securities Company, wherein it holds that the "holding" corporation organized by J. J. Hill and J. Pierpont Morgan for the purpose of holding the control of the Northern Pacific and Great Northern railway companies to prevent competition, was in violation of the law under the Sherman act. In other words, it was in restraint of trade to merge the two great competing lines and to operate them as one. This decision practically endorses the position of the executive branch of the government in its contention against the methods and operations of trusts. The announcement of the decision did not affect the stock market, except to cause a slight advance in the price of the stocks of the two roads concerned.

This decision will stand in importance as one of the greatest in the history of our national jurisprudence, inasmuch as it practically defines the limitations to which corporations may go. It is far-reaching in its effects. The principle involved applies to all corporate bodies organized for profit, and approves the Sherman act for the regulation of trusts, making it impossible of revocation by congressional action. The decision will rank in history with the famous Dartmouth College case and the notorious Dred Scott decision on the fugitive slave law. The Inter-State Commerce Commission may find in this decision some thing helpful to aid it in defining the limitations of transportation companies in the matter of arbitrary ratings, of classification and charges, and to more easily prevent extortion and unjust discrimination.

* * *

The Slaughter of Song Birds.—The wanton slaughter of song birds by small boys with air guns and nigger shooters is arousing public sentiment to a pitch where prosecution of these vandals will be energetically carried on. It is high time the officers of the law take due notice of the ruthless slaughter of the innocent song birds, and move with severity on boys, big and little, who are destroying them. Let the women of this State join in this crusade, for if a stop is not immediately put to killing song birds we shall be without them in California. Let the campaign be inaugurated at once by press, women and public officials to the end that swift punishment may follow all violators of the law.

* * *

Spare the Trees.—California is rapidly losing what forest trees it has. Not only in the towns and cities are our shade trees being destroyed by linemen in the service of telegraph, telephone and electric light companies, but the lumber companies are denuding millions of acres and wantonly destroying much of the young growth in our forests, so that the great West, which, less than a quarter of a century ago was literally a wilderness of fine forests, is, today, barren, showing only stumps and brown fields where verdant grasses and rich foliage grew in profusion. The result is that spring thaws create raging floods and summer suns seasons of destructive drouth, in which no green thing can live. Our protracted drouths are the result of denuding the land of its protection of trees and these will continue to afflict us until we return again to a balanced condition where nature originally put us, or at least, until we cover in part the territory denuded of forest trees with a growth of vegetation to induce rain and conserve the water which melts from snow, all of which now goes to waste.

The Bureau of Forestry at Washington has just entered into an agreement with a company controlling 1,300,000 acres of timber land in the States of Washington and Idaho to prepare working plans for their enormous holdings which will provide for growth of new trees to take the place of those that are cut, thereby securing a constant replenishment against denudation.

Tree planting and the natural reproduction of deficient forests receive a constantly increasing share of the attention of the Agricultural Department. Last year the department prepared plans for tree planting in twenty-nine States, involving the examination of 40,557 acres of land, including the prairie regions along the Fort Worth and Denver City railroad, 640 acres in Alabama, the Dismal Forest river reserve of Nebraska, the San Gabriel forest reserve of California—in Oklahoma, North Dakota and Arizona. The work for this year will include tree planting on Pike's Peak and in Wichita, Prescott and San Bernardino forest reserves.

* * *

No Relief In Sight.—Reports have been sent from New York to the effect that the transcontinental lines are about to reduce the cost of transportation to the citrus growers of California. It is a matter of regret to say that at present no relief is in view. The matter of freight reduction on California oranges and lemons has been pushed by the president of the Southern California Fruit Agency for several years, but as yet no compromise has been effected, and from all appearances none is in sight. We do not believe, as some newspapers contend, that the orange industry is on the verge of collapse, but we do believe, as has been repeatedly said in these columns, that sufficient reduction in freight rates should be made to the grower to permit of a better return on his investment. Such a reduction ought to be made by the railroads and we firmly believe it might be made without loss to them, and with future profit in the largely increased business which extended orchard growing would excite by reason of encouragement to the industry.

* * *

Vaccination Is Cheap Insurance.—Carefully estimated statistics place average losses from Black Leg in unvaccinated herds at 15 to 20 per cent. Estimated loss due to postponing vaccination until after disease has appeared in herds, 5 per cent. The possibility of even this 5 per cent loss can easily be avoided by vaccinating young stock previous to the beginning of the Black Leg season.

MARKETING FRUIT.

Mr. George T. Powell, a prominent fruit grower in New York, recently read an article before a Spencerport Farmers' Institute on fruit marketing, and among other things said:

"More growers fail in the important essential of properly marketing their products than at any other point. In many instances valuable products over which the agriculturist has worked the entire season, are practically sacrificed at the end of it through ignorance or inattention to the proper methods of marketing the fruit. The fruit grower should visit the markets himself and observe closely the methods, the demands of the buyers, and other essentials of the business. In this way a vast amount of practical and valuable information may be acquired.

"Growers do not recognize sufficiently the importance of proper grading of the fruit. Too often we get the impression that all the apples we grow should go into the barrels, and altogether too much does go there. The demand at the present day is for fruit well graded and of an absolutely good quality. Western fruit men recognize this fact and the consequence is that western fruit is more carefully graded than that of the East and commands a higher price in the markets of New York City. In California the people understand the science of marketing. The fruit is put up with uniformity, which unfortunately is not the case in New York State, where each individual fruit grower puts up his own fruit in his own way. The result is that the buyer casts aside our fruit, giving preference to the California products."

California fruit shippers will note the importance given to proper grading of fruit. Indifference to this feature has, in the past, proven a severe drawback to some of our fruit interests. If we are wise we shall take greater care along the lines suggested by Mr. Powell in caring for and marketing our fruit.

BY J. W. JEFFREY, LOS ANGELES

LET US REASON TOGETHER.

An account has been published of a meeting held at San Fernando on March 13th at which meeting the organization of "The Fruit Growers' League" was attempted. The plan proposed is to form such leagues in every citrus fruit growing district in Southern California, and meetings have been called, it is stated, in many localities for that purpose. It seems strange, that any one would attempt at this time to go behind what has already originated in the most sure and thorough effort at co-operation ever attempted among farmers. For four years the Cultivator has devoted a department to this movement, giving a history of its inception, an exposition of its principles and an account of its achievements. Nothing that any new Moses could do could come so directly in touch with the fruit growing individual as the agitation which began in 1892 to assume form in the organization of dozens of local associations, each with its own capital stock and all amalgamated under a comprehensive plan which for ten years stood the buffeting of opposition and adverse circumstances and won the victory as far as possible with the support of only a portion of the growers. This movement originated among the orchardists of Riverside and Pomona. It came directly from the people concerned fundamentally in the success of the citrus fruit business, was supported and extended entirely by these people, and controlled by them to this hour. Whatever evils exist in the business of fruit selling, be assured did not originate through any fault or omission of the co-operators. When experience has finally sifted out the proposition to a final conclusion, the people will see how utterly void of practical sense are such ephemeral efforts as are now being made to crystalize the dissatisfaction of a disastrous season into a movement without excuse, continuity or sound principles. The present movement to organize a side scheme is the first one on record in which the attempt has been made to organize the growers against themselves. The sober thought of every one must convince him of the impossibility of ever organizing anything as strong as the Exchange.

Let us place this matter in a stronger light. Suppose the "alleged" Fruit Growers' League could by some mischance secure the allegiance of 50 per cent of the growers. It would be composed of the same people now in some form of co-operative association. It would have no higher quality of business ability than the 50 per cent now in the Exchange, would meet the very same marketing difficulties and have the same opposition at this end of the line. The measure of business capacity can reach no higher than the average ability of the growers to prepare their fruit for the trade intelligently and economically; and their judgment in selecting the very best men to be found for managing the selling machinery. In every local association, local exchange, and in the Central Exchange the growers have built from the best men they have. Or, if not, would the proposed "League" be able to select better men? Would an experiment incited by a newspaper upon the issue of high freight rates or low prices have weight, authority or staying capacity, when an organization founded upon the eternal principle of selling one's own products, cutting out all unnecessary factors and eliminating all possible speculative elements has had extreme difficulty in holding its own against adverse conditions? A June frost would be a perpetual stayer in comparison with the proposed "League" should it ever get farther than freak head lines in a local journal.

If a co-operative fruit organization cannot be permanently constructed upon the issues of non-commission dealing, the elimination of speculation in fruits, distribution under constituted authority and preventing inter-competition between the products of each grower, there is no use of attempting it upon calamity, exhorbitant railroad charges and roseate promises of people who "win big fights" upon paper.

The Cultivator does not wish to question the sincerity of those who are attempting to correct the evils that may exist in the present methods of marketing fruit, whether they arise from faults of organization or outrageous circumstances. These people who are now making the new talk may be as sincere as were those who campaigned so faithfully during the early nineties for reform and did so much to establish it. But external remedies do not usually reach deep-seated troubles. Such are adverse weather, over-production, heavy competition from other countries and other classes of fruit trade opposition, excessive freight and icing charges, the difficulties of proper distribution and poor carrying qualities of fruit. These questions cannot be juggled with; they must be met with a united front by organization established upon deeper qualities than caprice, fault-finding or assumption. Some of them are beyond power of control from even infallible policies were such policies possible. Others have been handled with consummate ability and persistency, and all of them broadly and honestly. This is all that can be hoped for from any form of organization, and no one should follow any scheme that does not appeal to practical sense or recognize the futility of ill-considered effort. Whatever remedies are necessary must be applied through the medium of well considered and standing authority.

CITRUS FRUITS

A PROBLEM IN PACKING.

J. H. Reed in Riverside Press.

In taking but a part of a crop of oranges, is it best economy to pick clean over a portion of the orchard, or take part of the load from all the trees?

It may seem late in the season to discuss this matter, but I can't help thinking that many are acting in it without careful consideration, even now. Granting that special conditions may sometimes make it best to take the entire crop at one picking, under ordinary conditions, it seems to me a wasteful mistake.

The coloring of an orange is no more sign that it has completed its growth than that its starch has been fully converted into sugar, rendering it thoroughly palatable. Its size continues to increase for weeks and months after it has turned yellow; apparently slowly, but really not so slowly as many think, who have not given the matter special consideration. When my attention was first called to it some years ago, I carefully measured and labeled a large number of well colored fruits of different sizes, and kept careful record during the picking season. Though general observation had convinced me it was considerable, this test showed a much greater increase after the ripening process had commenced than I had supposed.

The commercial sizes, ranging from 96s to 300s, and below, vary by ⅛ of an inch in diamter. This 1-16 of an inch added to the surface, seems but a slight increase, but means more than one would casually think.

Let us figure a little. Allow a box, say of 150s (3 inches in diameter) to increase to 126s (3¼ inch), and we have saved 11½ per cent in solid contents or weight; that is, 8 pounds per box of 70 pounds, or 800 pounds on each 100 boxes. If worth 1½ cents per pound, it means a gain of $12 on the 100 boxes, leaving a net gain of $10 on that amount. An increase of ⅛ inch in smaller sizes, makes yet larger per cent of increase of solid contents. For instance, 250s (2½ inches) increased to 216s (2⅝), have gained over 15 per cent; that is 1050 pounds on every 100 boxes—$15.75. If fruit is worth 1½c per pound, a small fraction of which would pay for the additional cost of picking and trouble.

This slight increase of 1-16 of an inch to the surface is quickly added to all healthy fruits, till full maturity is reached, which is well on into the spring months. In fact it does not require long to put on ⅛ of an inch to the surface (an increase of two sizes), during the picking season, on thrifty trees, if they have been early relieved of a portion of their load. The increase from 250s to 200s (two sizes) amounts to 33 1-3 per cent of contents, or a gain of 35 cents per box of 70 pounds.

The extra cost of partial picking, and the convenience of having the orchard cleared early, are insignificant compared with these gains. Several of our successful orchardists who have handled their crops in this way for many years assure me that their saving is from 10 to 20 per cent of the entire crop—a matter certainly worth considering, at least.

Besides the increase of the crop there are several important advantages in this partial picking. Trees carrying a heavy crop well into the spring must spend on it much of the vigor needed for the blossoming near at hand, while if relieved early of a portion of it, the trees would be ready to take up the new work as well as develop the balance of the crop faster.

Again, early in the season, large sizes are most in demand. Even in the present glutted condition of the markets large sizes are at a premium, while small sizes are not paying their freight. Later in the season, as a rule, the small sizes are sought for, while large sizes are discontinued.

In younger orchards there is often a material saving in taking off early, specially exposed and partially sunburned fruits, many of which would go into the culls if allowed to remain till the trees are cleared.

This season we have an unusual small amount of splits, black rot and other culls, which, with no loss from frost, has materially increased the volume of marketable oranges. But ordinarily I am quite sure it paws to relieve the trees of all easily recognized culls at an early picking.

Of course the picking to size should not be carried to the extreme of leaving only the smallest sizes at the close of the season. But since our marketing is necessarily extended over several months, I am quite satisfied that the practice of relieving the trees gradually by commencing to pick the largest and the most exposed fruit early, followed by one or two partial pickings to size during the season may be much more generally adopted to the advantage of the grower far beyond any additional cost and trouble it may require.

WORKING OVER ORANGE TREES.

Editor Cultivator: Will you please tell me how it is best to replace Joppa orange trees in an orchard, bud over to Valencias or plant in two-year-old Valencias on good strong roots? Which would give the quickest returns?—Subscriber, La Canyada.

You will get quicker returns by budding over the Joppas as they stand, provided they are in a thrifty condition. The budding is successfully done by putting the ends in during the time when the trees are well along in their vigorous spring growth, removing all branches except those which are used for budding into, so that the growth will be thrown into the remaining branches. From four to six weeks after budding, the wrappings are taken off and the tops sawed off just above the buds, wax the ends and whitewash the trunks and branches. The particulars in the operation were given in the February 19th number of this paper. Bulletin 138, issued by the Agricultural Department of the State University, also gives detailed instructions. This may be had by dropping a postal card to the Director at Berkeley.

* * *

DEAD WOOD IN ORANGE TREES.

Editor Cultivator: Will you kindly answer through the Cultivator telling what harm dead wood does to an orange tree? Is it poisonous to the rest of the tree?—J. M. Stevenson, Nordhoff.

We have no reason to believe that dead wood in an orange tree is poisonous to it. It is simply nature's method of pruning. It, however, represents a loss to the grower, inasmuch as it must become useless and takes up room that should be devoted to growing healthy, well-lighted, fruit-bearing wood, before it dies. These dead limbs are useless for several years before they die, and should be removed before they become dead wood. As a general rule, orange trees have too much thick brush on them. This crowding of the leafy branches overgrows and kills the weakest growth. We do not know exactly what advantage there is to be gained by keeping this weak growth trimmed out, as we do not know of any comparative experiments that have been made. Mr. G. H. Powell expects to have work done along this line that will give much valuable and definite information. It would be safe, perhaps, to assert that the dead wood does no harm other than filling up the inside of the tree and excluding the light to a certain degree, and provides scratching posts for some of the fruit.

* * *

NAVELENCIA ORANGES.

A subscriber wishes to know the merits of the Navelencia orange. So far, we have been unable to secure definite information about this orange. We will give our readers all the facts obtainable as soon as we get them.

ORANGES AND SNOW.

In its last issue the California Cultivator criticizes the Times because we mentioned the snow on San Hedrin and the Citrus Fair at Cloverdale in the same issue. The tone of the criticism indicates that they think we made rather a ridiculous mistake, but we assure them we did not, and can go them one a lot better. Last Sunday we stood among the orange trees at Dan Gobbie's, in the western suburbs of Ukiah, and picked oranges while we looked at the beautiful snow capped range about eight miles east of Ukiah, and old San Hedrin loomed up perfectly white about twenty miles to the northeast. On the lower hills surrounding the valley the grass is growing fine, and the alfalfa and early sown grain in the valley are six inches high, making a beautiful green carpet from one side to the other. In the meadows and on the hillsides buttercups and baby-blue-eyes are beginning to bloom, while the hum of bees among the sweet manzanita blossoms lent an air of springtime to the scene.—Ukiah Times.

CLIMATE AND CROP REPORT

The weather and crop conditions are reported by Alexander McAdie for the week ending March 14, as follows:

Nearly normal temperature prevailed throughout the State during the week and the weather was generally cloudy or partly cloudy. The heavy rainfall on the 9th and 10th was accompanied by unusually high southeast winds in the central and northern sections, the most severe ever experienced in some places. The excessive rainfall in Northern California caused a rapid rise of rivers and creeks, which overflowed their banks and flooded grain lands and orchards. The snowfall in the mountains was unusually heavy and extended well down into the foothills. On the lands in those districts not under water grain is in good condition and growing rapidly, wth prospects of a large crop. From San Francisco southward the rainfall was lighter than in the north, but was of immense benefit to all crops. In the southern coast districts grain is in good condition and the outlook is said to be as good as at this date last year. In the southern San Joaquin valley and Southern California grain and hay prospects are better than at any time during the season. Green feed is plentiful in all sections and cattle are doing well.

The high winds caused some damage to orchards, mainly in the uprooting of trees, but the loss will not be severe. Deciduous fruit trees are in bloom in all sections and give indications of a large yield. Southern vineyards were benefited by the rain.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

PROBABLY SAN JOSE SCALE.

Editor Cultivator: My apple trees are affected by a disease or parasite which gives them a scaly or greasy appearance, as on twig enclosed. Usually only a part of tree is affected, but sooner or later that part dies. What can I do for them? Also please give treatment for wooly aphis on apple trees.

The specimen twig accompanying the above was covered with San Jose scale, and this is evidently what is killing the trees. The remedy is the salt, sulphur and lime spray, applied before the trees are in leaf. Wooly aphis on apple is a more difficult proposition to handle than even San Jose scale. This pest breeds on the roots of the trees, on which it produces great wart-like knots, in the crevices of which it lies, protected from any wash or spray that we can apply. Any remedy applied to these insects can only afford temporary relief to the tree. Clear the earth away from the roots of the tree and apply the kerosene emulsion, dig a trench around the trunk of the affected tree about a foot from the trunk and fill this with gas lime or wood ashes, rain falling on this will leach it and cause a caustic lye to reach a great part of the pests and will kill all it reaches; bi-sulphid of carbon has been used with good results, but with this there is danger of injuring the tree and it is not to be recommended. When the aphis makes its appearance on the twigs a good plan is to take a swab dipped in coal oil and touch the bunches where they are lodged.

* * *

GRAFTING THE GRAPE VINE.

Editor Cultivator: I wish to set 20 acres to grapes; the cuttings are made from Lenoir stock, which I prefer to bud or graft to table or raisin grapes. I would like to know through the Cultivator, or otherwise, how and when the work should be done. When should the stock to bud or graft from be cut? Should cuttings be budded after they are planted in field or in the nursery row, and at what time? What should be the probable cost per 100 for budding? This stock is to be planted on deep light sediment soil that cannot be irrigated. If cuttings are planted, how much rainfall will be necessary, with good cultivation, to insure enough moisture for first year? Any information will be gratefully received. Very respectfully, Box 345, Orange.

Scions for grafting may be cut at any time when the vines are dormant. If it is desired to keep them for any time before working, they should be covered with cool, moist sand or soil and not be allowed to dry out.

Any one of the methods mentioned by our correspondent may be followed. It is a common thing to remove the stock into sheds and graft on benches. The work can then be done under cover, regardless of the weather, and is much easier performed than either in the nursery or in the field. Grafting should be done during the dormancy of the vine, which is at any time during the winter months.

We cannot give the probable cost for grafting as it would vary with conditions, the amount paid, and the quantity of work performed. It is, however, a very inexpensive operation.

The grape is one of our hardiest of fruits and will live with very little rainfall, although, of course, it will be better if it gets sufficient. On the soil mentioned six inches of rain should suffice, if it came at proper periods.

If our correspondent will address Prof. E. W. Hilgard of the State University, he can procure two excellent bulletins on this subject, Nos. 127 and 146, on Bench-Grafting Resistant Vine and New Methods of Grafting and Budding Vines.

* * *

SEASONAL WORK AGAINST THE CODLING MOTH.

The season for spraying against the codling moth is close upon us once more and, in the apple sections of Watsonville, Santa Barbara and Sonoma counties, the pricipal apple sections of the State, active preparations are being made to wage a relentless warfare on this, the most serious and costly of all our apple pests. The excellent work done by the University professors in the Watsonville section last summer, will bear good fruit there this year in a wider and more intelligent use of the spray pump. The Paris green wash will still be used most extensively, although experiments have been carried on with other arsenical washes, for the reason that its use is more generally understood and no wash sufficiently better has been found to warrant its abandonment. The common formula of one pound of Paris green, six pounds of lime and 200 gallons of water is the one generally used and is well known to all old orchardists, but as there are many who have not used it, it may be well to give the whole formula. Make the Paris green into a paste, with a little water, before placing it in the spray tank, and while in use keep the mixture constantly stirred, or the Paris green will settle to the bottom and the last of the spray will be so strong that it will damage the foliage, while the first will be too weak to be effective. The object of adding lime is to prevent burning the leaves and in using it the lime should be slaked in water, and when it has settled, the clear water should be added to the solution. As to frequency of spraying, Prof. Clark, acting from his experience in the Pajaro valley last season, says:

"Our positive recommendations as to the all important question of timing the sprays is:

"1st. In every locality, until definitely proven that it can be omitted, spray at such a time as to leave a dose of poison in the blossom cup.

"2nd. One or more sprays for the spring brood of moths as determined by the breeding jar.

"3rd. Sprays against the summer and fall worms as determined by the examination of bands."

* * *

CAMELLIAS IN SACRAMENTO.

A. B. Nye, Governor Pardee's private secretary, has presented the Capitol Commissioners with a large number of Belgian camellias, which are to be used in the further adornment of the capital grounds. It is the intention to set these in masses in order to get the best effect. The selection is an excellent one, for there is no place on earth, we believe, where the camellia does better than in Sacramento. All the requirements for its growth are found here, a moderate temperature, moist soil and not too dry an atmosphere. The beauty of the camellias in the capital city is always a cause for comment on the part of visitors, and indeed they seem to grow here almost without attention. During the early spring months they bloom profusely and are altogether the most satisfactory shrub we know of for this section.

* * *

DRY OR WET SPRAYING.

Advocates of dry spraying and vendors of dry spraying apparatus are endeavoring to introduce this method into California to take the place of the present system of wet spraying. The dry spray has been extensively used in some of the orchard sections of the East and from reports seems to be satisfactory. In California it has not yet been tried to any extent, and it is questionable whether it would be as effective here as there, conditions and climate being so different. In the eastern fruit sections it is rare for a week to pass without some rain and the air is ever surcharged with moisture. In consequence the foliage of the trees is always damp and any dust thrown on it will adhere for some time at least. In California we have months without rain and with very little atmospheric moisture. In such case, will the dust form of insecticide remain on the tree long enough to be effective, or will it blow off, if not wholly, to so great an extent as to be valueless? Even in the East where conditions are more favorable for it, there is still a diversity of opinion in regard to its value as compared to the wet sprays. If the dust spray is as good, or any where near as good or effective as the wet sprays, it would be of great value in our State, especially in sections where orchards are located long distances from a water supply. In the Sacramento valley, for instance, there are orchards located miles from any water and where it is necessary to haul all the water required in the manufacture of the washes now used. This adds very greatly to the expense of spraying in such cases, and the use of a dry spray would be a great saving beside being much more convenient and easily applied. We should not advise any one yet to abandon the wash they are acquainted with and the effects of which they know, in favor of what may even be a superior one, but experiments with the dry spray are worth making and if they should prove as efficacious as those at present in use, they will work a revolution in our methods in many parts of the State.

W. HERBERT SAMSON, PROP.

We have for sale all leading varieties of Deciduous Fruit Trees

OUR SPECIALTY:

Lob Ingir or Genuine Smyrna Fig of Commerce

A WORD ABOUT FIGS: We sell the genuine Fig of Commerce. Our cuttings came from bearing trees in the orchard of the Stanford estate, near Vina, and the fruit from these trees, after being examined by the best fig experts of the State, is pronounced the genuine Fig of Commerce, the Lob Ingir. Dr. Eisen says this and no other variety should be known as Smyrna, if the name Smyrna is to be used at all. We can refer prospective purchasers to the Supt. of the Stanford ranch, at Vina, for a verification of this statement. As to my own reliability, I can refer parties to any of the leading merchants of Corning, and to the Bank of Tehama County, and the Herbert Kraft Co. Bank, at Red Bluff, Cal. No one in the Unites States originated the Commercial Smyrna Fig. It is a variety which has been grown in Asia Minor for thousands of years. Parties may originate a fancy-name and copyright it, but this does not make the fig they sell under a copyrighted name, any beiter. The fig we sell doss not require a high sounding name to make it appear as the only commercial fig. All that we claim for our fig is that it is known as the Lob Ingir, the cuttings of which came originally from the famous orchards of Smyrna, Asia Minor, and is of the variety so largely imported into the United States in the dried state. We are not charging you for a private copyrighted name, but we sell you good 2 to 4 foot trees of the Genuine Smyrna Fig of Commerce at $150 per M. To fully demonstrate the methods used by some nurserymen in giving old varieties of fruit trees a new name and thereby make it appear that they have the only genuine article, we will say, how ridiculous it would be if we copyrighted a name like "Muro" and sold the old variety of Muir Peach under this name. Do not be misled by copyrighted names. We have the genuine Smyrna Fig of Commerce and if you want to confirm our statement, we do not hesitate to refer you to the above named parties. We can supply prospective planters a small sample of our dried figs for comparison with the so-called copyrighted figs. We also have for sale all varieties of Capri Fig trees, and all of our customers will be supplied at the proper time with a colony of Fig Wasps, free of cost. Address

W. Herbert Samson, Prop., Corning, Tehama Co., Cal.

SEED BED STOCK...

Orange and Grape Fruit

Extra Fine Lot. Absolutely Clean

James Mills - Riverside, Cal.

BY J. W. MILLS, ONTARIO, CAL.

ATTRACTIONS OF THE DESERT.

The greatest charm that pervades the desert, as writers tell us, is almost wholly concerning the miner. This is not now the case in certain parts of the Colorado desert. Here, the farmer has gotten a foothold that seems to be a substantial one, and the regulation rules of farming are sometimes woefully out of place. Some of the strange sights and exaggerated growth of plants under irrigation make written descriptions savor of Rider Haggardism. We took a long drive over some of the "poorest" land in the heart of the Cahuilla district, where the encrusted surface seemed a mass of irregular blisters of dark brown soil. The wagon wheels went through it with a crushing sound similar to that caused by driving through a pond covered with thin ice. Inspection showed us that we were passing over a crust of salt—table salt—that was mixed with mud and dust. Beneath it the soil was moist and rich in appearance. We gathered up slabs of salt and dirt to take home and show our friends. Presently a bright green spot hove in sight, with what appeared to be a drift of snow around it. Near by an artesian well was spouting water into the air, the water being used to wash down and off the salt, so that the ground would be in condition to plant a melon crop. The land on which the barley was growing had been flooded, a ridge of soil having been thrown up around it. The barley had been cultivated in and the water turned on. The grain had made a growth of three feet and fairly covered the ground, no salt appearing on the surface of the soil in which it grew. The ridge of soil around it was snow white and crystals of salt even projected among the barley leaves along the border. Strange as it may seem, the barley next to this salt-covered ridge was the tallest and darkest green in color. The surrounding land, which had been flooded and left uncultivated, had the appearance of a snow drift and it was here that we gathered up some refined table salt, part of which we used on our hard boiled eggs at lunch time.

We came to a settler's shack, which domiciled an energetic farmer who was living out a homestead right. He showed us into his cellar, in one corner of which was his "time well," as we called it. The cellar was about six feet deep and a small hole was dug in one corner. At that time, the first of March, the water was nearly on a level with the cellar floor. The water in this hole rises and falls with the seasons as regularly as winter, spring, fall and summer come around.

Our wanderings finally brought us onto the higher and sandy lands where the artesian wells still spouted and where there was found no change in the soil, save an occasional layer of clay, for a depth of over 500 feet. Alfalfa sown on these lands in late winter, produced from four to six crops during the season. Alfalfa four or more years old produced from nine to ten cuttings. Asparagus was being shipped to the San Francisco markets by the first of March.

Many things of intense interest to the farmer could be told and while we have usually taken some of the reports from the desert with a "grain of salt," we have seen with our own eyes, farmers harvesting salt with their grain.

* * *

GRAPES FOR BLOOMINGTON.

Editor Cultivator: What varieties of table grapes are best adapted to our soil, sandy loam, stony in one or two places. The nurserymen I think of buying from recommend Black Morocco, Black Farrara and Black Cornichon. Is it advisable to plant all late or winter kinds?—Cultivator Reader, Bloomington, Calif.

Black Morocco would be all right with you and Black Farrara should do well, but Black Cornichon would not. This grape requires a heavy clay subsoil to do well.

The varieties of grapes which would be best for you to plant depends on what you expect to do with them. If you expect to grow them for peddlers or local trade, good varieties that come along during the whole season would be what you want. If you expect to ship, late grapes would be the best. Red Emperor would do better with you than Purple Cornichon. Golden Queen is an excellent late grape. It is exceedingly productive in our light sandy soil and does not crack after a light shower comes on it. It ripens between Thanksgiving and Christmas, but we have eaten good grapes from the vines as late as New Years. For a good September grape for local use, it is hard to surpass Cinsaut. It is particularly well adapted to gravelly places.

* * *

EASTERN GRAPES FOR THE SOUTH.

A great deal of attention has been given to planting our standard varieties of table grapes of European origin, but our native American varieties have not met with decided favor among the greatest number of consumers. There is complaint among a great many people that these grapes are "too foxy", they make mouth and tongue sore. We have found this true with some varieties, and the method of culture may also have something to do with it. We have noticed that some grapes which have not received enough water are inclined to have concentrated juice and a tough pulp. The sugar content is sometimes increased and the other properties are intensified. The Pierce grape is a splendid bearer and the fruit is fine, still there is the complaint that it is "too foxy" for the taste of some. We have mentioned that Agawam and Lindly were favorites. They are certainly as free from the defects mentioned as any grapes that we know of. Their beautiful, wine red color is uniform all over the berries, which are of good size, tender and juicy. Grapes of the same class, but not as large, have sold in the Los Angeles markets for better prices than our best standard varieties. The Worden has proved to be one of the choice kinds of eastern grapes in the foothills near the coast.

There is a growing demand for this class of grapes. The large number of eastern people who come to this State, "long" for a taste of this fruit after having eaten the numerous varieties that we have to offer them. We notice also that the native Californian relishes them even though he sticks to his Muscats. We are aware ourselves that though nothing can surpass the Muscat in our opinion, still we are acquiring an Agawam taste that is alarming. The Concord takes a back seat with us.

LIME, SULPHUR AND SALT WASH

For winter use upon deciduous trees for pernicious scale, curl leaf, peach moth, etc.

The following formula if properly prepared and used will prove an effective solution:

Unslacked lime, 40 pounds.
Sulphur, 20 pounds.
Stock salt, 15 pounds.
Water to make 60 gallons.

Directions.—Place 10 pounds of lime and 20 pounds of sulphur in a boiler with 20 gallons of water, and boil over a brisk fire for not less than one hour and a half, or until the sulphur is thoroughly dissolved. When this takes place, the mixture will be of an amber color. Next place in a cask 30 pounds of unslacked lime, pouring over it enough hot water to thoroughly slack it; and while it is boiling add the 15 pounds of salt. When this is dissolved add to the lime and sulphur in the boiler, and cook for half an hour longer, when the necessary hot water to make the 60 gallons should be added.

Follow the above directions carefully, particularly the boiling, if you desire success. Use this remedy as late in the season as possible. The best results will be obtained by spraying just before the peach trees burst into full bloom. On cloudy, moist days blossoms will not be injured by this wash, but in dry weather with north wind blooms will be damaged if full strength is used.

Copies of this formula will be sent free to fruit growers of the county. —R. C. Kells, T. B. Hull, H. P. Stabler, Horticultural Commissioners, Sutter county, Yuba City.

The J. W. Armstrong Nursery Co., of Pomona, who are large handlers of deciduous and citrus nursery stock, write as follows:

"We assure you we most highly appreciate your kindness is placing us in a position to secure business. We already feel that the numerous letters we receive through the medium of your valued publication has amply repaid us. Trusting we may have the pleasure in the near future of reciprocating, we are, yours most sincerely, J. W. ARMSTRONG NURSERY CO.

One of the Cultivator subscribers suggests that the reported rich findings of gold near Kingman, Arizona, are only a part of a "gold brick" scheme of the first water. In any case, the Cultivator readers may be wise to investigate thoroughly before parting with good money.

CONSERVATION OF MOISTURE.

All of us are too likely to follow in the old grooves. Even when new conditions arise, and when thought should hurry us to vary our practice, we are still too apt not to think and go on in the old course, often to the serious stay in our success. We all know that water is the crying need of our orchards. This year we have so little rain that the growing season is likely to come upon us with far less than the usual amount of water in the ground. Unless we have water now to give the ground a good soaking, we shall be obliged to give more than the usual water next season or else our orchards are likely to feel the want of moisture seriously.

* * *

Conserve the Moisture.—Because of this lack of moisture, we should give the matter of water conservation unusual consideration. The wise orchardist will try every way to save the water. What can we do to help out in this emergency. If we have already plowed under a generous crop of legumes—Canadian field peas fill the bill well—this will help wonderfully to increase the water content of the soil, so that we will be called to water less than we otherwise would. Whether we have been so provident or not, it will pay us well to keep our ground so as to capture every drop that does come to us through the rains that will come to us from this on. We will also cultivate as soon after every rain as is possible, that we may keep the perfect dry earth mulch, and prevent all the evaporation that we possibly can. Deep plowing will help to capture all the rain, and a deep mulch will help to keep it. If the ground is left not too smooth it will also keep the rain water from flowing off, and hold it where it is needed. As the season goes on we must keep the soil loose and friable, and must cultivate often enough to ensure this. I believe that this fine soil must be at least six—James Mills says eight—inches deep to secure the best results. How few do this; and yet it will pay a tremendous bonus on the expense of such cultivation.

Again a great deal is lost by the quite too common way of irrigation. Instead of the usual shallow furrows, these should be deep. It will pay to have them at least one foot deep. This puts the water down where it is needed, and the least possible amount is lost by evaporation. We must remember that all of the water that goes to wet the upper eight inches, and the most that wets up the upper foot, is lost, as it all evaporates. At the Arlington orchard, they not only run the water through deep furrows, but they make a furrow between each two rows at right angles to these, which is made to do service, and works to put more water deep down in the soil.

One more thing will help to conserve the moisture, and I regret to say that some of our good fruit men are careless in the matter. I refer to leaving the ground smooth after cultivation. Ridges permit our daily winds to lap up the moisture in a most extravagant fashion. Millions of gallons of water are thus lost to our soils each season. Some run a board smoother over the ground after cultivation. If this has myriads of small teeth in the hinder margin it not only levels the ground, but it also leaves it loose at the same time. Mr. Mills prefers a weed cutter for this work as he thinks it serves less to compact the soil and thus less evaporation is experienced. Where there is considerable clay in the soil, this last point is to be closely watched. If a good "cover crop" will make one or two irrigations enough, for the season; if we catch all the rain that comes, if we make the best use of "dry earth mulch;" if we plow once or better twice deep down; and if we keep the land level and friable at all times, we may still smile, though the clouds are few and stingy.

* * *

DESIRABLE CLIMBING ROSES.

Mrs. P., subscriber, from North Pomona, asks what I like best of the roses to climb over the house. I suppose that any one that has seen our house needs no assurance that we like not only climbing roses, but climbers of all kinds. This question properly belongs to Mr. Braunton, but I know better than even he can what does best on our house. Let me say that we do not let the vines recline or rest on the house, but put up wire netting, or an iron frame work. I think that this is not only better for the house, but it is easier if we wish to paint, as we shall wish to about every seven or eight years. One of the most satisfactory roses is the beautiful white, long blooming and ever vigorous Lamarque. Two roses that we enjoy very much are the Beauty of Glazenwood, usually called the Gold of Ophir, and the large single Cherokee. The former is beautiful salmon pink, the other snowy white, which forms a fine contrast with the yellow stamens. These are very full of thorns, and are not long in bloom. Yet their healthy foliage makes up in part for the brief blooming season. I would never put these near a hydrant, or near the oil tank. Speaking of thorns, we rejoice in the Banksias, the yellow and white. These are always pretty and ready for business. They have no thorns. So "every rose does" not "have its thorn." They are prolific of bloom, and are like the others just mentioned, most wondrously attractive when in bloom, which we wish were of longer duration. We are very fond of our Reve d'Or. It does very well, blooms a long time, and the yellowish-white flowers are very pleasing. We like the Crimson Rambler, which, with its cluster of dark red flowers is very charming. The rich, red elegant Reine Marie Henriette we would not set again, as it costs too much to keep it free from mildew. Neither would we plant the Marchel Neil, as the buds blast in a most provoking fashion. As Mrs. P. is so near us, I think these hints will be an aid to her. It will be seen that we give old roses. We have no prejudice against the old, well tried friends, that rank as do these plants just commended for climbers.

* * *

INSECTS ON CELERY.

M. C. Cole, Santa Ana, has written me twice about his celery. He has now sent me a sprig which is bleached in a way that seems not to please Mr. Cole. A careful examination finds abundance of red mites and numerous thrips on the plant sent. Either of these would acount for the lack of vigor of which Mr. Cole complains. These are both serious pests, as the citrus growers too well know. I have no doubt but that spraying with distillate spray which has been found so valuable in the citrus orchards, against the scale insects and the red mites, would prove equally effective in the celery fields. I should go slow until I had proved the remedy. I believe a two and one-half per cent mixture would not harm the plants and would kill all the pests, of both kinds. This could be applied easily and cheaply by use of the same machines that are used in the orchards. These stir or churn violently as the mixture is applied, and so this mechanical mixture is applied safely and has proved wonderfully effective in our warfare against the orchard and garden pests. If we could have pouring rains these pests would be destroyed in such numbers that they would do far less mischief.

* * *

EUCALYPTS FOR PILES.

M. C. Cole, Santa Ana, asks for the best Eucalypts for piles. The common blue gums have been grown very successfully for this purpose. I know of a gentleman of Carpenteria that has found his blue gums for piles very profitable. He cuts them and lets them grow up again. He sells them for a high price. He uses them in a double row as a wind break, and by cutting alternately, he preserves his wind break and reaps good profit besides. The soil and climate conditions at Carpenteria, I should not think greatly different from those at Mr. Cole's place in Orange county. Without doubt Mr. Cole would find Eucalyptus rostrata and E. citriodora good for the same purpose, and they would almost surely do well on his place, as they take to moisture in soil and air. He might try all three of these species.

* * *

EASTERN GRAPES.

Mr. Cole also asks why eastern grapes do not do well here. They do especially well in such localities as that of Mr. Cole. I never saw better Ionas than I have seen and eaten, grown at Goleta. The Delaware and Niagara do well there and the Worden Concord, and those splendid varieties of the Rogers' Agawam and Salem are superb. I have all of these, and while my others are all going with the Anaheim disease, these seem all right. I got mine at the Fancher Creek Nurseries, Fresno.

KLEVERS MODEL NO. 29719

BRED BY E. KLEVER BLOOMING BURG, O.

THIS HOG WAS SOLD FOR $5,100.

and the man that bred him is a user and friend of Prussian Stock Food, the great Conditioner and Flesh Producer for Cattle, Horses, Hogs, Sheep, etc. He has

FED PRUSSIAN STOCK FOOD!

and says he thinks it is very good. He fed it to some pigs and it cleaned the worms out of them in a hurry and he never had pigs do better.

Horses will be kept healthy and will do more work on less feed.
Cows will give more milk and be free from disease. Makes calves grow.
Hogs will grow and fatten in much less time and on less feed and be healthy.

SOLD IN PKG'S 50c & $1. PAILS $3.50

FREE. Send names of 6 stock owners and we will mail you our 68 page Farmers' Hand Book.

40 cts. and up

Trees are strong, vigorous, healthy. No Red Spider. No Black Scale. Do not forget this. Going out of the business. Want to sell. Come and see us.

Mills & Masters

Jas. Mills, Mgr. **Riverside, Cal.**

"The Orange and Lemon vieing with each other in the production of wealth."

Thomson's Navel Orange Grove seventeen months from planting. Eureka Lemon Grove seven years from planting.

Just Good Citrus Trees

Is the strain of the song we wish to sing to intending planters this week, because the planting season is now on and it is the part of wisdom to get your trees into the ground. Of course you want good nursery trees, which fact leads us to state that we can meet you as to quality as well as price.

Profitable Citrus Orchards

Are pictured in the two illustrations herewith presented, both of which show trees furnished by us. Did you ever see a finer, symmetrical growth or a more vigorous stand of trees in orchard rows? This is the kind you want, and if you plant our trees it is the kind you will get.

How to Grow Money

With an orange or lemon orchard is tersely explained in our little booklet "The Yeas and Nays of Citrus Culture," which contains more practical information to the square inch than any other similar publication. If you will write us the number of trees you may want, and mention this advertisement, we shall be pleased to send you a copy. Correspondence a pleasure.

OF INTEREST TO FRUIT GROWERS, STOCKMEN AND AGRICULTURISTS

MISCELLANEOUS.

New, clean pure alfalfa hay is being offered at Riverside at $9.00 per ton.

The Porterville $25,000 high school bonds were sold to the State last week at a premium of $825.

The cement works at Napa are building an addition, 60x80 feet, to increase their grinding department.

Citizens of Napa are at work raising funds to secure rights of way for a new steam road from that place to San Francisco.

The Puente Oil Company has broken away from the Standard Oil Company, and will erect a refinery and market its own product on the coast.

The Pinal Oil Company at Santa Maria, on Tuesday, struck oil in its fifth well at 1900 feet. The well flows about 250 barrels a day.

The Union Oil Company, operating in Santa Barbara, is about to locate at Lompoc a refinery which will be adequate to every emergency.

In Ventura the authorities are using the tramps on the streets with good effect. They are made to clean the public highways and public lawns.

Pasadena has an ordinance which went into effect Saturday regulating the sale of milk. The Board of Trade made the ordinance very stringent.

Report comes from Napa county that Texas fever has broken out among cattle recently shipped into the county. Over 500 cattle are affected.

State Mineralogist Aubury declares positively that the claim that radium has been discovered in Mariposa county, in this State, is a fake pure and simple.

The Board of Supervisors of Napa county have purchased a ton of poisoned wheat, which is being given out to farmers who will use it to exterminate squirrels.

An oil pipe line will be built this summer from leading oil fields to the bay. The right of way has been secured to Monterey except three miles which will be appraised.

Articles of incorporation of the Oxnard Light & Water Company have been filed with the county clerk. Five directors have been chosen and the company will go to work at once.

Applications for stock in the Bank of Solano, the new financial institution in that place, poured in so rapidly that within twenty-four hours the hundred thousand dollars capital stock was subscribed.

A merchant freight line has been established between Los Angeles and Riverside. The teamsters deliver the goods at some less than railroad rates, besides saving drayage at both ends of the line.

Herman Dickel, of Anaheim, sent a small box of oranges addressed to a relative, in Germany, which has been returned with the statement that the fruit can not be admitted into the country for fear it may be infected with San Jose scale.

Squatters are charged with a scheme to locate on the Griffith Park lands, some 3015 acres donated by said Griffith to the City of Los Angeles, Griffith, it is alleged, had no title to the land and therefore could not donate it to the city.

The report telegraphed from San Quentin of a shortage in the prison accounts is emphatically denied by Director Felton, the warden, and Gov. Pardee. The fact that the jute bags were not all taken by farmers who made a small deposit on them, has not created a shortage in the prison accounts, as was claimed.

Saratoga, Santa Clara county, will hold its annual blossom festival on April 1st this year. This event has grown to be very popular, many people going long distances to witness the beauty of miles of blossoms in and about this mountain town. San Jose will hold its blossom festival the day following the Saratoga event.

Reports from the irrigation experts of the Department of Agriculture and the University of California upon the drainage systems necessary to save the vineyard and orchard lands in the vicinity of Fresno are to the effect that the alkali which has proven so stubborn to overcome is easily subdued by draining the lands. Heretofore water brought the alkali to the surface, doing immense damage to the orchards.

According to a dispatch from San Rafael, the San Quentin jute mill has a surplus stock of 4,000,000 bags. The mill made and sold 6,000,000 and sold all of them on a deposit of 10 per cent. The shortage of the grain crop caused those who made purchases of bags to forfeit their advance payment. The mill is turning out 18,000 bags per day. There will be plenty and to spare.

The people of Covina are aroused over the shooting of song birds by boys with air guns and nigger shooters. They propose to prosecute all boys who hereafter are caught shooting birds.

James Irvine, owner of the San Joaquin ranch, near Santa Ana, is to divert a considerable portion of the waters of Santiago creek to irrigate a tract of land in the Santiago watershed, which is now used for grain and pasture; the land so irrigated to be set out in fruits. The hillsides now producing fine grain and pasture, it is believed, will produce fine fruits.

It is announced that the San Mateo county authorities will this year build three miles more of oiled roads. Last year they built three miles of country road and oiled two miles of streets. While at most places the practice has been to use from 150 to 300 barrels of oil per mile, the San Mateo roads were given 940 barrels per mile. The Sacramento Union gives the following as the method in building the roads, which is very expensive but very satisfactory: The soil of that county is largely a gravelly loam, and being generally undulating, a suitable grade was first established, thirty-five feet wide, turnpiked the same width, and then the crown for a width of twenty feet was replowed so as to give it a uniform looseness, and harrowed. The oil was then applied, moderately heated, until the ground would absorb no more. The twenty-foot strip was then replowed, turning the oiled matter under and the dry earth to the surface, which was then harrowed smooth and oil again applied until it would absorb no more. Then the road was harrowed until the oil was thoroughly kneaded into the ground, after which it was rolled many times, giving a tough, elastic surface from six to eight inches thick. The oil used, having a specific gravity of about sixteen degrees, was obtained from Kern county at a total expense, applied to the road of $1.25 per barrel.

The Agricultural Department at Washington has engaged E. M. Ehrhorn of San Jose, to keep a record of blossoming and ripening of all varieties of fruits. There is much to be looked up and learned in the matter of blossom and harvest times, all bearing directly upon the success of the grower. It will be observed that in addition to these two seasons in the life of the tree and fruit, the department desires to know the date when the terminal bud forms. This is the last bud on the tip of the limb, and it usually appears about the middle of June.

It is expected, among other things, to learn from a record of this kind something more tangible concerning the fertility and non-fertility of blossoms.

Every grower should assist in this important work for it will prove of immense value to all growers in this State.

Thoroughbred Scotch Collie Pups For Sale.—Potter Ranch, Alhambra, Cal.

Carney's Great Co-Operative Club $1

Send me the names of five friends or neighbors whom you believe will be interested in a journal standing for the farmer's best interests, and I will send you these five great periodicals, each of which stands at the head of its class.

Coast News and Notes

CONTINUED

LIVE STOCK.

Sheep shearing has begun actively in Kern county.

A violent form of distemper has broken out among cattle in the foothills near Madera.

The Julian Miner of last week says: Some cattle are dying in this section, mostly cows, they all being affected in the same manner, a sort of paralysis of the hind quarters, showing that it is a disease caused by climatic and other natural conditions. The mortality is confined principally to stock raised on the coast, where the natural conditions of the pastures are quite different from the mountain ranges, and it takes a long time for cattle to get used to the different qualities of grasses and the ways mountain stock have in hunting for feed.

AGRICULTURE.

A San Diego florist cleared $1500 on carnations during last summer. He expects to double his sales this year.

Poor business management is alleged to be the cause of a deficit of $72,630 in the accounts of the State Agricultural Association.

San Jose farmers give out the information that enough rain has fallen in that locality to insure all crops.

The California Vegetable Union has just closed a contract with the cabbage growers at Placentia to handle the entire crop of the district on the same terms as last year.

The storm of March 10th, while exceedingly severe and damaging in the northern part of this State, did untold good to ranchers in Southern California. The hay crop is now practically secure.

Dr. A. A. Maulhardt, of Ventura county, is going extensively into the raising of ginseng. With Dr. Maulhardt are associated Louis Maulhardt and J. B. McCloskey, of San Francisco, an expert ginseng grower.

A. W. Browne, of Ventura, has sold his Las Posas ranch to Fred Roussey of Oxnard. The ranch comprises 420 acres and was valued at $13,000. Mr. Roussey gives part cash and his business in Oxnard, which will be conducted by Mr. Browne.

A new grain distillery is soon to be established at Hanford. There is only one other grain distillery in operation in the State, that being located in San Francisco. The Hanford distillery will be of small capacity, having an output of about 10 gallons per day. The material will be corn exclusively.

Judge Ogden, of Oakland, has granted a permanent injunction restraining the smelter in Alameda from operating on the ground that it is injurious to the vegetable growers of that locality. The Encinal says: "The smelter owners will, of course, appeal from the decision, which means ruin to their large investment."

There are tracts of native hay lands in the great Yukon valley, Alaska, highly valuable. Last fall. J. A. Rouse, a Dawson freighter, put up more than 600 tons. He sold 600 tons at $140 per ton—$84,000—and had sufficient hay left to feed quite a herd of stock until good grazing comes again. It netted him not less than $80,000.

The Fresno Democrat, in discussing the raisin situation, says there are only 2 blocks of goods in the hands of the outsiders. The larger is held by the Droge Fruit Company, which recently purchased the goods of W. A. Nevills. The other is held by Fred Ward, and consists of about 150 tons. The last named is the only block of consequence that remains in the hands of the grower. As soon as these lots are sold, there will be nothing but association raisins to buy.

HORTICULTURE.

The railroads are promising the orange shippers enough cars from this time on, to take care of California's citrus interest.

A Fresno packer estimates that there is less than 40 cars of the 1903 crop of peaches in the State, and these will be quickly bought up.

The supervisors of Santa Cruz county have been asked to appropriate $500 to help carry on the codling moth investigation this summer.

The Santa Fe road, with its 4500 refrigerator cars, will make an effort to secure its share of hauling of the coming deciduous crop in Northern and Central California.

The San Jose Herald is making a telling fight against the sale of wormy apples, contending that the trade on first-class fruit is injured by the sale of infected apples.

At Corona, groves amounting to nearly 3000 acres have been sprayed or fumigated for the eradication of insect pests since October 1. Aside from that work, town lots infested were also treated.

At the recent meeting of the Zante Citrus Association, held at Porterville, the following resolution was unanimously adopted: That it is the sense of this meeting that the Zante Citrus Association maintain its organization intact, and leave the marketing question open until later.

The Golden Nugget Navel orange is said to be an improved variety of the navel. Of the Japanese oranges the Oonshiu is said to be one of the hardiest and easiest grown, and the Dancy Tangerine the best of all. Oranges may be planted at any time, from now to July, on irrigated ground. —Chronicle.

J. H. Reed, an orange grower of Riverside, has been making some special observations regarding the picking of oranges. He finds that the best plan is to relieve the trees gradually, going over a part of the orchard at different times. This, he claims, gives the fruit left a better chance to mature and also is beneficial to the trees themselves.

W. W. Phillips, E. B. Hutchinson and C. W. Chauncey have been appointed horticultural commissioners of Fresno county. One of their first official acts was to purchase two tons of squirrel poison, which will be sold in 50 pound boxes to farmers, at three cents per pound, and in smaller quantities at five cents.

The orange growers in this section, says a correspondent from Redlands, as the returns from the January pool of the Citrus Union come in, begin to feel more cheerful. Instead of the expected "red ink" returns, the union has made a second payment, making a total of 80 cents per 100 pounds thus far, and another payment coming. The car famine has been partially broken, and with a better market in sight, it is believed the balance of the crop will bring better returns.

The Sacramento Union makes the statement that the Sacramento County Horticultural Society has awarded a contract for spraying of neglected, scale-infested trees within the city limits. A scale-infested tree is a diseased tree, and those who keep their trees clean are entitled to have the danger which it is to their well-kept trees removed. On this principle authority to spray neglected trees has been given the Horticultural Commission. Not only will the country districts be protected by spraying of the city trees, but the trees will be given new life, resulting in better growth, better appearance, and, in the case of fruit trees, better yield.

MISCELLANEOUS.

Visalia will advertise for bids for oiling streets of the city.

The Carnegie library at Fresno will be completed by April 1st.

One hundred Russian colonists are at Anaheim with a view of locating there.

A second national bank is to be established at Imperial with a capital of $50,000.

The city trustees of Pomona, at their last meeting ordered extensive street improvements.

$240 FOR LARGEST WATERMELONS

After 40 years of experimenting and testing all notable varieties of watermelons, we now recommend, especially, "Tenderseed" for home use and "Emerald" for both home and market. We think they are the best obtainable. Seeds 10c a paper in silver. 2400 papers. The purchaser who grows the largest melon of either variety will positively receive one-tenth of our gross sales of seeds of that variety. Caution: Wrap your silver in a little paper, and write your name and P. O. Address plainly.

LEE SEED CO., Burnt Corn, Ala.

C. H. SESSIONS, ASSOCIATE EDITOR

SEASONABLE PLANTING.

Mrs. Minna E. Sherman.

The fruit grower who does not keep a few cows to furnish fertilizer for the orchards is working at a disadvantage and losing a way of increasing his crops without expense, and if he keeps good cows they will bring him a revenue between seasons. In Germany herds of cattle are often fed without a thought as to the labor, simply having to pay for the food consumed, the profit being from the manure, that will in turn produce another crop that is the money-maker.

Wherever it is possible between the rows of orchard trees to grow a crop of cow peas, they should be planted, the tops cured into hay while the peas are soft, the roots plowed into the soil leave there a quantity of nitrogen in an available form for the trees. This crop during the late summer and fall is grown and off the ground in time for the spring cultivation, so the supply of moisture is not exhausted in the soil.

A few acres of land allotted to the cows will balance a fruit ranch nicely, and, first of all, a small patch of alfalfa should be sown, while a small field is reserved for the soiling crops. This in the autumn may be sown to rye, barley or wheat. However, after frequent trials, in the interior, where the frost is too heavy for cow peas, we plant the common table pea, usually preferring the Niles, as it makes heavy leaf growth, with the red Russian oats. The land is freed from stubble and weeds by raking and burning, the peas are sown broadcast, at the rate of ten to twenty pounds to the acre, then plowed under, the field is well harrowed and the oats sown and crossed with a harrow to cover it lightly.

The cow pea, which is really a bean, can be treated in the same way. These crops are made into hay or into ensilage when the oats is in the dough stage of ripeness.

After the pea crops are harvested, the land is plowed and planted to corn. If this corn is for soiling or for silage, plant it with the corn planter in rows instead of hills. The rows should be four feet apart; when grown in this way, the stalks remain slender and the leafage is greater. When the corn is planted in hills and given plenty of room it grows rank and the stalks are tall, leafless for the first four or five joints. This tall corn is poor feed, we might as well give the cows Arundo Donax to chew, for it is only a little tougher than some of the corn stalks exhibited, as showing the wonders of California at the Chamber of Commerce rooms throughout the State. The field of corn that averages seven to eight feet in height with abundant leaves affords the best feed; corn of this height will come close to twenty tons to the acre when cut for silage, while the corn with larger stalks will fall under fifteen, so the height does not make up in tonnage for the loss of leaves. The corn association is doing good work along the lines of selecting and perfecting the varieties. There is gained an increase of twenty per cent in leaf and in grain in these improved forms the first season they are sown in California. These experts send out the corn on the cob, every ear is perfectly filled, with even sized grains on small cobs. It shows its breeding the same way as cattle—in its uniformity.

Indian corn can be planted from March to July and mature a good crop. For the past eight years we have put the corn into the silo, excepting one season. That one experience we hope never to be foolish enough to repeat, but we will tell you about it. After selling one hundred and fifty milk cows and several carload lots of heifers, the milking string was reduced to forty head. The corn sowing was neglected and no silage made, for the cows seemed a mere handful to feed. The winter came and it proved cold—the green feed did not come, the hay went short and then came buying of hay and adding oil cake to the ration, still the milk yield dropped down until the cows were only averaging 21 pounds daily. Worse than that, they did not look sleek and fat, though they were fed all they should have of the heavy grains. It was the meanest looking lot of cows ever on the ranch. The next spring how the men hustled to put the first crop of alfalfa into the silo for them, and how anxious every one was to see plenty of corn sown. Some of the old hands that had regarded the making of silage with suspicion as to its paying, now became the warmest advocates of the silos. The corn has been planted so faithfully every year since that we have had more than the silos would hold.

The common stave silos have been in use at Los Palos for three years and even in the heat of the San Joaquin valley have proven successful, so the expense need not deter anyone from trying the experiment. With a silo well filled dry years are successfully bridged over at a low expense for feed. If the winter proves wet and feed comes on early, the silage left over is good for the next season. When the new crop is ready it is cut and put on top of the old silage. Our large three hundred and twenty ton silo at one time had three layers of old silage under the fresh one, and how glad we were it was there when the dry years came, for it was enough to carry the cows and the young stock until the welcome rains made the grass green once more.

The principal catch crop used is sorghum for summer soiling. The early amber or sugar sorghum, has the seed drilled in rows, so it can be cultivated and irrigated in one direction. It produces a crop of leaves every five or six weeks; it should be cut whenever it begins to form heads at the second joint from the ground. It is then fed green or cured into hay. The first cutting of sorghum should give from three to five tons of green feed to every acre. We usually make three cuttings and consider fifteen tons to be an average crop for the season; the last crop is pastured. This has to be carefully done, leaving the cattle on the field only a few hours at a time for fear of bloating. In the feeding of sorghum care must be used, the freshly cut stalks should be widely spread on an alfalfa pasture so the cows cannot pick it up too rapidly. It is generally conceded that sorghum bloating does not differ from alfalfa bloat. There is, however, a few cases of sorghum poisoning reported every year. Why or how the sorghum secretes at times prussic acid has not been determined. The experimental stations of Nebraska and Colorado have found in fields of sorghum where cattle have died, that the leaves of the sorghum had as high as fourteen per cent of the weight of the entire plant of prussic acid. The cause of this secretion is unexplained, varying conditions of heat, moisture, under cultivation, have all been considered and dismissed as untenable; so far the experts are completely at sea. While there are other plants recommended from time to time, still we dairymen of California, with our fields of alfalfa to feed green or as hay, and corn, green or as fodder, or better yet, as silage,

If your druggist does not stock our vaccines, order direct from us, we pay all charges.

have a complete food when we balance the two against each other. A herd of cows fed thirty pounds of good corn silage and ten pounds of alfalfa hay will produce milk at a cheaper price per pound than when on the heavier grain foods. There is a higher condition of health and the dreaded milk fever and the lesser loss, though often serious enough, of garget, rarely appears in the herd where the feed is of this form. It aids digestion, and yet, if well balanced, to furnish the required nutriment to produce milk and to sustain bodily vigor.

BLACK LEG.

The vital interest in that dread disease of stock caused us to ask Mr. Cutter, of the Cutter Vaccine Co., to supply our readers with some information on the topic and the benefits of vaccination of young cattle. From the matter which he sends, which we are compelled to condense, we take the following:

Black Leg, symptomatic anthrax, or quarter ill, was formerly supposed to be a form of anthrax, but is now known to be an entirely different disease and due to a different germ.

Black leg is a disease caused by germs, which enter the body sometimes by means of food or drink, but usually through scratches or wounds in the skin. The spores of this germ are very hardy and will live in a dry state for a long time, and are easily carried from one ranch to another by animals or man. They can also be carried by running water.

Symptoms.—Black Leg has a very rapid course, which, with few exceptions, ends in from one to three days. It is characterized by a rapidly increasing swelling of the skin, which crackles on being touched. This is due to the gas contained in the tumor. The swellings may appear on different parts of the body, and are chiefly formed on the upper part of the thighs, neck, shoulders, lower region of the chest and loins. They never appear below the hocks and knees.

The swellings are at first very small and painful. They rapidly spread, may attain extraordinary size in a few hours, and may even extend over the whole trunk. They become cold, and no pain is felt by the animal when an incision is made into them. After incision, a dark-red, frothy, unpleasant smelling fluid flows from the wound. General symptoms are sudden suppression of appetite and rumination, high fever, lameness and dragging of legs. Breathing becomes difficult.

Post-mortem examination discloses the connective tissues in the region of the swellings to be infiltrated with blood and containing bubbles of gas. The muscles underneath the tumors are of a dirty brown or even a black color. They are brittle, rotten, porous and rich in fluids. The blood is of normal color and readily coagulates; the spleen is unchanged.

Animals Affected.—This disease affects cattle, sheep and goats. The cattle commonly affected range in age from three months to eighteen months. Ocasionally calves under three months and cows over two and one-half years years old are affected, but this is the exception.

Treatment.—Owing to the rapid and violent course of the disease, treatment is of but little value. Various kinds of remedies and methods have been tried, but without success, and in many instances worthless substances have been placed on the market and sold as vaccines, such as ginger, garlic, asafoetida, mustard, etc., and setoning, rowelling, bleeding etc., have been practiced. These drugs and methods are absolutely worthless, and bleeding, hoof-splitting, etc., not only aggravate the disease in the sick animals, but the bloody, serous fluid carrying the germs of the disease, is scattered over the ground, thus endangering the lives of the well animals.

The only method of combating the disease is to prevent it by vaccination.

Vaccination for Black Leg was introduced by a French scientist named Arloing in 1883, but his methods were improved upon and modified by Kit, a German scientist, and the latter's process is the one universally adopted. During the last fifteen years many million head of cattle have been vaccinated with great success. Indeed, the cost per dose is so insignificant and the results so satisfactory that vaccination is looked upon as indispensable by large and small cattle growers. The method of vaccination is so simple that it can be carried out by any intelligent stockman or veterinarian. Immunity usually lasts a life time. There are exceptions, however, which we make under head "Age to Vaccinate and Susceptibility."

Time to Vaccinate.—Vaccination may be performed at any time, but the spring or fall is preferable. It may be done at branding time, but should not be done at same time as dehorning, castrating, or other surgical operations.

Age to Vaccinate and Susceptibility.—These two subjects are so interwoven that they are better considered together. Of cases of Black Leg occurring under 5 months old, statistics go to show that:

One-half of 1 per cent of deaths occur below 1 month old.

8 per cent of deaths occur between 1 and 2 months old.

13 per cent of deaths occur between 2 and 3 months old.

38 per cent of deaths occur between 3 and 4 months old.

41 per cent of deaths occur between 4 and 5 months old.

Above 5 months old calves are usually classed as 6 months old, so statistics for the month between 5 and 6 are unreliable. The most susceptible age is between 6 and 18 months old, and it is unusual for animals over 2 years old to be affected except in very virulent outbreaks. Statistics also go to show that pure blooded or high-grade stock are earlier affected than low-grade range cattle. This being the case, the safest method with graded stock would be to vaccinate at the age of 3 or 4 months, and re-vaccinate 6 months later. This would entail very little extra work or expense, as calves vaccinated in early spring could be re-vaccinated when late spring calves are vaccinated in early fall. These latter calves could be re-vaccinated the following spring. Of course these rules should be varied according to the experience of the individual stock owner. If he has observed that his calves are susceptible to Black Leg earlier or later than 3 or 4 months he should vaccinate accordingly.

The objection, however, to vaccinating calves under a month or two old is that usually they are not susceptible to the disease at that time, consequently the vaccine does not "take", the animal is not protected, and becoming susceptible later may contract the disease.

As before noted, in case calves are vaccinated at 4 months (or even later), it is much safer to re-vaccinate them at the time younger calves are first vaccinated.

Re-vaccination is advised in such instances:

First—Because there may be individual cases which were not suscpetible to Black Leg at time of first vaccination, and which are therefore not protected by that vaccination.

Second.—Because the immunity conferred by vaccination of very young calves is sometimes short-lived, and a calf successfully vaccinated at 4 months old may become susceptible again at 10 or 12 months.

Third—Because after revaccination the possibility of contracting Black Leg is so remote as scarcely to exist.

There are various forms of vaccination. Single vaccination in which sufficient is applied at once, and used generally in stock on the range in large quantities. Double vaccination, sometimes for more valuable stock, when a weaker dose is given at first, followed by a stronger.

Then there is powder vaccine which is mixed in water and injected; string vaccine, which is an absorbent card impregnated with vaccine which, by means of needle, is drawn through the fleshy part of the tail; and then there is pill vaccine, which is injected under the skin of the animal, when it is slowly absorbed.

A WORD IN SEASON.

I love my fowls and like to make them comfortable, and, after all, comfort is one of the three essentials to egg production. One of the greatest means of comfort to my hens has been the shade I provided for them, and incidentally, that shade, besides being a comfort to the hens, has been a source of profit to me. The first thing after laying out my pens, I chose and planted fruit trees, for I decided they would give the best results, so I fairly crowded the yards with peaches, plums of six varieties, apricots, figs, loquats, pears, walnuts, quinces, etc. In each yard there is a water hydrant, and under the fruit trees is the iron kettle which serves as drinking fountain, this is washed out three times a day, the soiled water being emptied around the trees, thus keeping the soil moist and loose, benefiting both trees and chickens, for the fowls love to wallow in the damp dust under the trees, and the soil is kept loose by a weekly spading round the trees. These trees began to bear the second year, and ever since have been loaded with the most luscious fruit I have ever seen. I picked seven hundred and seventy-seven peaches off one tree, in its third year, and I feared for the life of the tree, but the richness of the soil, from the chicken droppings and the constant cultivation, from the busy hens gardening around it, have kept it in perfect health and bearing, and it is now about eleven feet high and eleven feet across. The fig, plum, walnuts and pear trees have done equally well, so that the income from the fruit is quite an item on the ranch. The shade of trees in this climate is essential for the comfort and well being of fowls, and the fowls benefit the trees, not only by their droppings, but by destroying the insect pests which would otherwise injure both fruit and trees. No trees in this neighborhood show as marvelous growth and great productiveness as my trees, all due to the care the fowls have given them. Trees and fowls like to be petted and the more they are cared for the better the results. It is not too late yet to plant deciduous trees. Get a few of the best varieties, dig good large holes for them, mine were three feet deep and three feet across, and treat them as I treated mine and the results will be exceedingly profitable and satisfactory to both you and the hens. The more comfortable you can make the hens, the more profitable will they be to you. Little chicks, little ducklings and little turkeys in this climate all require shade, and the best shade by far for them is the shade of trees. If you have not trees, bushes or even large weeds are better than no shade. If you have no shade, open up a gunny sack, tack or nail four laths along the four sides and set it up for a small shade, or drive little posts into the ground and make a frame on which to lay palm branches or any other green branches, or even rushes or weeds; any shade is better than none, and little chicks in a brooder should have access to shade as well as sunshine in this sunny land of ours.

BROODER CHICKS.

Two letters, one from S. G., of Santa Ana, another from J. B., Covina, ask advice about raising brooder chicks; both are having the same trouble with "bowel trouble." It is the same old trouble that nearly all of us have been through at some time. It comes either from the eggs having been overheated in the incubator, or chilled in the incubator, or else from the same causes in the brooder. Chilling is the lesser of the two evils. The last day before the eggs hatch the yolk of the egg is drawn up into the chick through the navel. That yolk has to be assimilated or digested in the chick; it takes from twenty-four to seventy-two hours for this yolk to be assimilated, and if during this period the chick is overheated, it so weakens the bowels that the yolk cannot be absorbed and the yolk hardens; the same happens when chilled, but not always so badly. The yolk, when hardened, if allowed to remain in the chick, as it does, unless you cut open the chick (a very delicate surgical operation, which a surgeon, a friend of mine, successfully performed, removing the hardened, tough yolk, it putrifies, brings on bowel trouble and ends by blood poisoning. The end comes usually before the tenth day of the chick's life. I have tried to explain this so you may understand the symptoms and not feel utterly disheartened. Now, as to curing them, you will readily see that there is very small chance of any cure. I would advise your killing off the most sickly, putting the least sickly away in another brooder, or with a hen, pick off the droppings, as you say they are "stuck up behind," but don't wet them with water, as it chills them too much, and slightly grease the vent hole with carbolated vaseline. For food I much prefer dry, small grains to any other for little chicks; the chick food sold by the poultry supply houses is the best, but you might give, in addition, a hard boiled egg, shell and all, chopped fine with an onion. Onions are a wonderfully good tonic for chicks and turkeys. Add to the drinking water a little bicarbonate of soda whenever there is any bowel trouble with fowls, either young or old. I have also found that rice, boiled in milk, with powdered cinnamon, is excellent. I put a tablespoon of cinnamon in a pint of milk and sufficient rice to thicken it when boiled twenty minutes, about two-thirds of a cup of rice. This is an excellent remedy for diarrhoea in fowls and is especially good for brooder chicks that

Keep Them At It.

The hens that are properly fed and stimulated will be laying long after their poorly kept neighbors have "laid out," become broody and gone to hatching.

PRUSSIAN POULTRY FOOD

makes hens lay longer and keep in better condition. Makes eggs strong in vitality that hatch healthy chicks. Makes chicks grow faster and makes an early layer of the pullet. Keeps off all forms of cholera and other poultry diseases, being a medicated food. Price 25 and 50c. See ad elsewhere in this paper about Prussian Lice Powder and Prussian Lice Killer. Ask your dealer or write us direct.

SUCCESSOR TO MRS. A. BASLEY

have been chilled.

Chilling chicks at any time before the yolk is assimilated is very disastrous. I am not scientific, so cannot give the reason for the yolk hardening, but I know from sad experience and sadder post mortem examinations, what the results of either chilling or overheating in the brooder are. The brooder should be well ventilated, without a draught, oxygen is as necessary for the baby chicks as for human beings. Above all, do not put too many chicks in a brooder, they may seem to do well for a few days, but each day will find a few dwindling, growing smaller and weaker, and the loss of those few would probably be more than the cost of another brooder, besides if you have a few puny chicks they seem to infect the air and they are really a source of danger to the others. Poor little things! It is pitiful to see them, humped up, often shivering, but making a brave fight for life, till at last they succumb to the blood poisoning, for such it is, and die. I have found that, with chicks that hatch a day too late, these are always delicate and many breeders kill them off, but by putting them out with a good motherly hen, as a friend of mine did, he saved them all, and this plan might be well worth trying.

* * *

ANSWERS TO CORRESPONDENTS.

Will you please tell me through the columns of your paper where I can obtain eggs for hatching of the thoroughbred Black Spanish variety? Can you give me the name and address of any one who makes a specialty of this breed. Trusting that I may receive the desired information in the next issue of your valuable paper, Yours truly, M. Day, Anderson, Cal.

Will any of our readers who have Black Spanish fowls please answer Mr. Day? There were none exhibited at San Francisco, Los Angeles or San Diego shows, and none are advertised in our paper.

* * *

I have tried to answer our correspondents faithfully, but have been absent from home, have sold my ranch and moved to Hollywood, to Warner and Harold avenue. Some letters may have been missent or mislaid, and if so, I will ask the writers to forgive the omission and beg them to write again, addressing me simply Hollywood, California. Hollywood is a delightful suburb of Los Angeles, and my friends of the poultry yard will always be heartily welcomed at my home there.—Mrs. A. Basley.

ARTIFICIAL INCUBATION AND BROODING OF DUCKS.

Any one engaging in the duck business and proposing to make money out of it, ought to begin with an incubator. Time was when the hen was indispensable, but now old methods and appliance are being superseded. The great advance made in the poultry industry the last quarter of a century has made the incubator a necessity. Our large broiler plants and duck ranches would be an impossibility without artificial incubation.

In buying an incubator, get a twelve dozen egg size to begin with. Now level up your machine with a spirit level, so that the heat will circulate evenly. Light your incubator lamp and run it until you have it regulated so that the thermometer stands at 103 degrees. Grade your eggs (that is, have the large ones in one tray and small ones in another). By putting a ¼-inch strip of wood under tray—on tray slides—with small eggs in, you can have all eggs on a level. Put your thermometer on the eggs so that the bulb will rest between two eggs, with the other end the highest.

Start your machine cold, with eggs in cold. Some breeders have their machine heated up to 103 degrees before putting in eggs. I start my machines cold, with the best results. Now that your machine is running, don't turn the eggs until 48 hours have past. Begin now to add the moisture, put in just enough to last two days, then run one day dry.(Watching the air cell). If the air cell gets too large keep in moisture, if it does not develop enough run your machine dry, using your own judgment and knowledge. Now, don't be afraid to cool the eggs. I know that those who have the best success with artificial hatching let the eggs have plenty of time to cool each day. So many are afraid that they will not get them hot again soon enough; they commence to work the regulator as soon as the eggs are put back into the machine, while it is the fact that the regulator when once set should be let strictly alone. In cooling eggs I allow twenty-five minutes a. m. and p. m. my machines being in a cool basement, incubators can keep an even temperature with good ventilation.

Duck eggs can be hatched successfully any season of the year. Buy an incubator. I do not say that it will make you rich right away, or that it is like finding money, but I do say that you can not put any equal amount of money in any other farm implement on earth that will give you an equal return.

An incubator will set when it is set.

An incubator does not leave the nest.

An incubator does not fight and break the eggs.

An incubator does not do a lice hatching business.

WinnerBuffalo World's Fair, Los Angeles, Oakland, Fresno

We won nearly every 1st, 2nd and Special on White Leghorns at Los Angeles, December, 1903. The greatest exhibit ever heldwest of the Missouri.

WHITE LEGHORNS

Our flock was formerly headed by the Prize Cock of the New York show, whose sire also won the first at New York the previous year. Of our bird, the judge said: "The best-shaped bird I ever saw; the finest tail and carriage I ever saw; the whitest bird I ever saw."

Among the choice leaders now of our flocks is Rob Roy, a most perfect specimen of extremely large, snow white birds, winner of 3 firsts at New York State Fair, and other prominent exhibitions. He is also a remarkable sire of prize winners. One of his cockerels is at present among the leading birds of the Eastern States. Romeo, a 7 lb., large, snowy white bird, winner of first at Madison Square Garden, New York's great show, and winner of first wherever shown, as well as being a remarkable sire. Similar remarks apply to Sunny Jim, a high-class large, perfect bird, from famous egg producing strains of large eggs.

Best Strains, Best Birds, Greatest Layers, Largest Eggs, Up-to-Date in Every Respect. None better. Lay more and larger eggs, 6 and not over 7 to the pound. Test yours.

To our flock of already choice birds, we have recently added some of the best birds to be found among the most famous flocks of the largest and best Eastern breeders, Selected not only for their Show qualities, but more essentially for their laying qualities of large eggs, which we have always made our strongest point in breeding or selecting. Among them is "WHITE ROSE," first pullet at Madison Square Garden, January, 1901; first prize pullet at Cortland, December, 1900; also winner of Golden Special for highest-scoring bird in Show, 96½ by Zimmer; also her two full sisters, and first prize hen, Snow Queen, at Madison Square Garden, New York, 1903. Judge G. H. Burgott says of her in American Fancier, Jan. 17, 1903; "A typical grand bird." Also others equally good from the same pen. and the prize cockerel at the Pan American World's Fair, (we having previously owned the prize cock and infused his blood in our young stock). We now place him as a splendid addition of new stock, and one of the most perfect speeimens of true type of large pure white Leghorns to be fonnd.

"The hens that lay are the hens that pay." Nearly all flocks of White Leghorns are the old small variety, layers of small eggs; our strain is snow white, large birds, bred for many years to lay more and larger eggs. Ours won many first prizes all over the East at biggest shows as well as Pan-American World's Fair. Such strains of White Leghorns give one-quarter more egg production, cost one-third less for feed and care than any other variety, while the large white eggs sell from 2c to 5c more per dozen. Buy a choice cockerel, the best in California, and improve your flock. Eggs for hatching.

W. W. HOWARD 3024 E. Main St. Los Angeles, Cal.

Brooding Ducks.—A duck should have every opportunity for growth from the moment it leaves the shell until it reaches a suitable size for the market, or arrives at maturity. Success lies in the rule—keep your ducklings growing. Every time a duck is chilled or exhausted its growth is retarded. As a profitable method of raising ducks, either for the market or fancy, the brooder has come to stay. Now that your ducks are hatching see that your brooder is nice and warm to receive them. If your brooder is too warm the ducklings will crowd away from center of heat; if too cold they will huddle close to heat; so by studying their habits you can tell if they are comfortable. Wean them from the heat in twelve days. At night put them in boxes covered with burlap. See that your brooders and boxes are kept clean and success is yours. Yours for ducks and better ducks, James Hague, Oakland, California.

[Any information on water fowl can be secured by writing Mr. Hague, who will answer through the Cultivator.]

James Hague, proprietor of Fair Oaks Duck Farm, of Oakland, announces that he will not exhibit any water fowl for competition for premiums at any poultry show held in this State this year. Mr. Hague says that he proposes to encourage others whom he knows have prize winners to come out and exhibit.

MAINTAINING POULTRY.

While the life of a chick is a mystery yet unsatisfactorily defined it is evident that from its inception until its termination there is no standing still of the animal structure. During the existence of life, the materials necessary for the maintainance and growth of the animal organism are carried on through the circulation of the blood. Also the wasted tissues are being constantly removed through the same agent. The blood being replenished by means of nutriments furnished in the food and, as the blood contains all the elements of the fowl, it is essential that the food contain these elements in forms that are digestible so that they can be used to renew the blood which is the life of the fowl.

It is very necessary to have some knowledge of the internal arrangements of the fowl's digestive canal with its several modifications. However necessary this knowledge may seem when viewed from a scientific standpoint, we regard it secondary in importance to an understanding of the nutritive ratio and value of food products. Foods rich in protein are necessary for the formation of muscles and flesh. Protein nutrients are abundant in beef scraps or lean beef, whole wheat, wheat middlings and oat meal. Whole or cracked corn contains more carbonaceous or fat forming elements but fed in connection with other grains forms an excellent ration. Wheat seems to be better adapted than any other food for an exclusive diet, but when fed alone to fowls that are confined in barren runs, it is too concentrated. The high price often prevents the poultryman from feeding wheat exclusively at times when conditions are otherwise favorable for the use of it more extensively. Green foods are evry essential in forming the ration of a flock of fowls at any season of the year and when used in connection with nitrogenous and carbonaceous grains properly proportioned the mash can be practically eliminated from the use of a part of the diet. We do not wish to be understood, however, as looking upon a properly constructed mash as not being beneficial, it is of value from a finaancial standpoint as well as a valuable acquisition as a health factor. The mash is misused perhaps, more than any other ration and unless compounded and used regularly with some degree of intelligence and with a certain object in view we should not advise the use of it at all. The average farmer we find contends that his hens lay just as many eggs and the chicks develop just as rapidly as the standard bred fowl of the fancier that is fed a variety of grains, mashes, beef scraps, cut bone, oyster shells, vegetables and cut clover. It would be a very strange state of affairs if the hens found upon the farms of today, descendants of some fanciers yards, receiving top crosses each year from the best egg producing and flesh developing males in the land with access to grain, hay, clover and other flesh forming and egg producing foods to be had in any market, did not yield a bountiful supply of both meat and eggs. It is a long step in proof of the fact that the pure bred cockerels found running upon their farms are the direct source of these far greater returns from the money expended in procuring them than is derived from any other investment upon the farm.—M. E. Wilcox, in Farmer's Tribune.

Factory of the Petaluma Incubator Company, Petaluma, Cal.

ECONOMY IN FEEDING.

Keep down expenses in every possible way. Study how to feed in the most economical manner. This does not mean that the fowls should be stinted in anything necessary to their health and thrift. That is not economical feeding. On the contrary, it is very expensive feeding—the most expensive that could be adapted. But utilize all waste products which can be made to serve as wholesome food for fowls. Cut down the grain bill. Taking the country over, the hens are fed at least double the quantity of grain that they ought to have. They would be far more profitable if fed less grain and more bulky vegetable material.

It takes thought, and careful planning, and work to keep down expenses in the poultry yard. Many people who rear poultry successfully allow their expenses to eat up their profits. If one makes use of every available means to reduce expenses he will be surprised at the little cost required to carry a flock through the year, and yet keep them in the very best plight. We should guess that fully nine-tenths of those who keep fowls attend to them in person. They do not employ any outside labor, and keep their flocks within limits which will make this unnecessary. With these people the principal saving in the way of expense must be in the feed. It is money in their pockets to think very hard over this problem.

MAKING POULTRY PAY.

The only way to make money out of Standard poultry is to do business with those who want that sort of poultry.

The only way to do business of this kind to a paying extent is to advertise.

If advertising always paid it would not be necessary to say anything further on this subject. It might clinch the truthfulness of the above propositions if I were to say that no breeder of Standard poultry has ever built up a big business without advertising, and that several have made very comfortable competences by advertising.

If I had all the money the poultry breeders of this country throw away by mistaken advertising every year I would not be writing these words today. I would be in some fair southern clime enjoying the balmy air in my new automobile.

Not very encouraging for a beginner, is it? Yet, in the face of this undisputed fact, I say in all sincerity that without advertiing it is impossible to build up a big business in Standard poultry.

The beginner in poultry advertising is very likely to begin by experimenting in mediums of low cost. Very often these bring results so small that further advertising seems to the novice like a waste of money.

Sometimes the beginner expects too much from advertising. He expects to take one inch one year in some paper where the cost will be, say $10, and get orders for all the stock he has for sale. This would be on the "something-for-nothing" order, and such leals rarely "pan out" in real life.

The question to be considered is what should a poultry breeder invest in advertising for every dollar's worth of stock or eggs he has to sell?

During the last year I have put this question to a large number of breeders who advertise continuously and have a large business. These men have made money breeding Standard poultry and have learned that advertising pays, if the proper mediums are used. They practically agree on what advertising should cost per dollar of sales. One well-known breeder told me he spent $1300 in advertising and sold something over $15,000 worth of poultry and eggs. Another spent a little more than $2000 to do a business that amounted to $22,000, and another said his advertising cost him 25 per cent of his sales.

At the regular market price the best bird that ever grew in the United States would be worth not to exceed $3. The highest price ever paid for a single bird in this country was something like $300. The bird that sold for this price was sold at a profit of at least $297, and the owner could well have afforded to spend $100 in advertising him.

Not so very long ago I stood in a meadow in Massachusetts looking at a flock of White Wyandottes. The owner pointed out two in the flock that were sold for $100 each, and said he expected to sell four or five more for a similar price.

Eggs are worth in spring, say 15 cents a dozen in market. If they are the product of hens that will score high in the hands of an expert judge, those eggs will sell for from $2 to $5 for thirteen. Whether they sell for $2 or $5 per thirteen will depend altogether on who owns the hens, and the difference will be entirely due to advertising. The man who has advertised the most and the longest will be able to get the highest price.

One eastern breeder sells eggs regularly for $5 per thirteen and has orders for all the eggs he can get at that price every year. That same breeder has been advertising regularly for more than twenty years, and he uses ten inches of space the year around in nine-tenths of the papers he uses. The same breeder sells more than half his male birds at $10 or more each—because he advertises.

Suppose I should buy of that breeder a pen of birds, paying $100 for the cock and $50 each for the females. They would be of the very best that that breeder can produce after all his years of experience in mating. Does any one think I could get $5 per thirteen eggs from those hens even if I were to advertise that I bought the best stock of the breeder? If any one thinks so he is very badly mistaken. The buyer would prefer to go to the original breeder for eggs, because he has seen his name in so many papers for so long a time that he has been educated to have confidence in him.

The beginner will not get as good returns the first year as he will the next, and the third year will be better than the second, and, other things being equal, each succeeding year will be better than the one just preceding it, because continuous advertising is cumulative in its effects.

A painter can go out and paint a day or two without evil effects, but all the same a little of the lead in the paint has been absorbed by his body. If he keeps on painting he will continue to absorb lead poison, and, after a while, he will reach his limit and painter's colic will have him in its painful grip.

It is the same with advertising. Every time a reader sees an ad. it gets a little better hold on him, and if ever the time comes that he wants to buy he is going to buy of the old advertiser from preference.

The poultry breeder who expects to have $100 worth of eggs to sell can well afford to spend $25 in advertising. He will have $75 for about fifty dozen eggs that would have sold in the market for $10, at the outside, a clean profit of $65 on an investment of $25.

There are several mediums that I would use if I wanted to sell $100 worth of eggs for hatching, and I would be just as confident of the desider results as I would that I could buy 25 cents' worth of sugar for a quarter of a dollar.

* * *

To sum up the whole matter: The poultry breeder must advertise to build up a big business; he must not expect too much in the way of results at first; he must keep on year after year; he must advertise judiciously.

* * *

Start right and keep on right, and success is certain, for there is as good and as constant a market for Standard poultry as for market poultry. There is money in either kind, but there is the most money in well advertised Standard poultry.—Agricultural Advertiser.

Eggs for Hatching

Thoroughbred White Leghorn eggs, 75c per 15; $4.00 per 100. Buff Orpingtons, $1.00 per 15.
LOUIS S. FLETCHER, ANAHEIM. CAL.

S. C. W. LEGHORNS

Strong constitutional birds. Small pens. Fertile eggs guaranteed. Reasonable prices for commercial hatching. Pains taken in packing.

THE NATURAL HEN INCUBATORS AND BROODERS

Points of Merit That Are Causing Such Large Sales of These Machines All Over the U. S.:

A continual circulation of pure, fresh, warmed, moist air in every part. Chicks can regulate their own wants as to heat and air by having a range of from 60 to 100 degrees to go into. Chicks will not crowd, as they have warm material to place their backs against similar to the old mother hen. No chilling or overheating. Lamp fumes or gasses entirely separated from chicks and fresh air. Brooder can be heated up in fifteen minutes in any season. The most economical on oil of anything in the shape of a brooder. One filling of lamp—3 quarts of oil—will last from five to seven days in mild weather. The incubator is guaranteed to hatch chicks as strong as the hen can. The only brooder that has and is capable of raising 100 per cent, not only once, but time after time. Our catalogue and book combined will explain more of the merits that have made these machines famous. Send for it. Mailed on receipt of 10 cents in stamps. It has helped thousands to success that have previously failed with other makes.

SHOEMAKER'S BOOK ON POULTRY

and ALMANAC for 1904
There is nothing in the world like it. It contains the following: 212 large pages, handsomely illustrated. A number of most beautifully colored plates, true to life. It tells all about all kinds of Thoroughbred Fowls, with life-like illustrations and prices of same. It tells how to raise poultry successfully and how to treat all diseases common among them. It gives working plans and illustrations of convenient Poultry Houses. It tells all about INCUBATORS and BROODERS. It gives full instructions for operating all kinds of Incubators. This chapter is marvelously complete and is worth dollars to anyone using an incubator. It gives descriptions and prices of Incubators, Brooders, and all kinds of Poultry Supplies. In fact, it is an encyclopedia of chickendom and will be mailed to anyone on receipt of only 15 cents. Your money refunded, if not pleased. Address

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, GLENDALE, CAL.

ROSES.

J. L., Sierra Madre.—Your Maréchal Neil, if good size, should not be harmed by an asparagus, but a foot away, unless the latter has grown to be a large vine; if such is the case, would move the asparagus. For yellow rose for cut flowers, Marie Van Houtte is a good one; if not yellow enough, try Perle des Jardins. In the bud Safrano is beautiful, though an apricot or fawn, rather than yellow. In reds, Papa Gontier gives a fine bud, but with short stems. In your section Meteor should give free buds—in lower altitudes it blasts very badly. It is a grand rose when perfect. Jubilee is another good red, while for a good old standby—good in all climes—Agrippina has few, if any, equals.

* * *

Desert Planting.—A bulletin on "Shade Trees and Other Ornamentals," by Fabian Garcia, of the New Mexico Experiment Station, may prove of value and interest to many in the colder parts of the desert—too cold for the pepper tree to grow successfully. Mr. Garcia recommends, for trees: The "Tree of Heaven" (Ailanthus glandulosa), Ash (several species), Box Elder (Acer Negundo), China Berry Tree (Melia Azedarach) and its variety, the Texas Umbrella Tree, and several cottonwoods; these latter, where the water supply is good. It is stated that in starting the cottonwood they take good sized limbs, soak them for a while, and plant them out. The American Elm (Ulmus Americana), Kentucky Coffee Tree (Gymnocladus Canadensis), Black Locust (Robinia psendacacia), Honey Locust (Gleditschia triacanthos), and the Russian Mulberry (Morus alba Tartarica), are all extensively used. Others equally as good are: Osage Orange (Foxylon pomiferum), a native pear (Pyrus communis), the Lombardy and Carolina poplars, Purple Leaf Plum (Prunus Pissardi), Soft Maple (Acer saccharinum), Sycamore (Platanus occidentalis), Walnuts (several species), and the wild olive or Russian Oleaster Eleagnus augustifolia.

In evergreens the best are: Arborvitae (Thuja ocidentalis), Spindle Tree (Euronymus Japonicus), Indian Cedar (Cedrus deodora), Japanese Cypress (Retinospora plumosa), Privets (several species of Ligustrum), Red Cedar (Juniperus Virginiana), and numerous shrubs are added to the list.

* * *

FLOWERS FOR PERFUMERY.

A note on flower culture for distilling in Southern France, contained in a recent consular report, states that the following flowers are most largely grown for the distilling of perfumes: Violet, acacia, jonquil, mignonette, rose, orange flowers, jasmine, tuberose, and carnation.

Fifty breeding ducks should keep three 200-egg incubators going, and turn out between two and three thousand ducks in a season, giving one man all the employment he would want.

Thousands of men and women in California are today breeding pure-bred poultry at a good margin of profit as a reward for their labor, while at the same time much enjoyment is gained from the occupation.

IRRIGATION NOTES.

Modesto is planning for a great irrigation jubilee, to be held in that city April 22 and 23. The people are planning for excursions from various parts of the State. Then observation cars will be run through the famous Turlock and Modesto districts. There are certainly many magnificent canals and lateral ditches which one may see in passing through that section. The gospel of irrigation is spreading and as Scipio Craig says, rain is each year more fully proved a poor substitute for irrigation. Success be with the Modesto and Turlock people.

* * *

The Chino Land and Water Co. will commence in a few days the drilling of at least three 14-inch water wells in the lower part of the valley.

* * *

Copeland Bros. are boring another well on their large ranch near San Jacinto. This will make the twelfth well put down by these ranchers. It is their intention to soon bore a six hundred-foot well.

* * *

The office of the experiment stations of the Department of Agriculture has just issued a bulletin on "Acquirement of Water Rights in the Arkansas Valley in Colorado," by Hon. J. S. Greene, of Pueblo, formerly State Engineer of Colorado, prepared under the direction of Elwood Mead, chief of irrigation investigations. The bulletin is written specially for those who are contemplating settling in the Arkansas Valley.

* * *

There was never a season when pumping plants were in such demand as this year. While it may be that as a rule pumping is more expensive than gravity flow, yet it is reasonably sure and in time of scarcity, invaluable. Many a ranch now has its own pumping plant, which is used in emergency only, but often proves the salvation of valuable property.

* * *

The Del Monte Irrigation Company's big pumping plant at Pomona started last week.

HOME BUILDING.

The tendency now is toward fewer and larger rooms; to have at least one large living room in the house; in the smaller house to make the hall a reception hall, doing away with the reception room or parlor. The kitchen is being more carefully planned as people realize the importance in the daily comfort and economy of the convenient and well-planned kitchen. There was a time when the superficial features were given undue consideration, and when a house was planned with reference to rare occasions of party and reception. Today a wiser idea prevails and the daily life of the household becomes the controlling influence. Sliding doors are less in evidence; the desire to throw the house open to accommodate one or two days in the year and to be inconvenienced the remaining three hundred and sixty odd days has gone by. The fireplace is built to use rather than to help furnish. Room closets, linen shelves and many other conveniences are thought of and planned for rather than cozy corners and comfortable window seats.—Farm Home.

Few people except trained nurses know that a restless patient is made much more comfortable if the corners of the under sheet are carefully pinned to the under side of the mattress with safety pins. Draw the sheet tight and pin it securely. It will be a relief to you and the suffering patient.

Turkey raising has become almost a distinct branch of poultry industry and requires a location very different from that needed for chickens, geese or ducks. Turkeys, while thoroughly domesticated, still retain that natural disposition to roam, and for this reason it is impossible to succeed with them in small lots. They must have range, even when being prepared for market, and when this is given them they are but little more troublesome than other kinds of poultry.—American Truck Farmer.

Saving deposits for children is one of the best plans ever devised for encouraging economy and frugality in children, as money deposited for them gives children valuable business experience, and the first lessons of economy are more easily learned if the savings are for some fixed or definite purpose. Open an account for your children.

You need not hesitate to bring small amounts to the bank; any amount of one dollar or more is acceptable at any time when convenient.

A MOLAR PLEXUS.

Farmer—"How much d'ye charge fer pullin' teeth?"

Dentist—"Fifty cents an acher."

Salt does not kill poultry, says a poultry exchange, though such has been the claim. If the fowls are allowed to have access to the broken rock salt, or brine from pork or fish barrel, they may eat too much and be injured, but a proper proportion of salt in the food is as necessary for fowls as for animals. Many diseases are due to a failure to supply salt, and this accounts for the cures effected by it in some cases, the fowls when sick being benefitted by salt because it supplies a long-felt want.

Salzer's
National Oats
Greatest oat of the century. Yielded in 1903 in Ohio 187, in Mich. 231, in Mo. 255, and in N. Dakota 310 bus. per acre. You can beat that record in 1904!

JUST BE GLAD.

Oh, heart of mine, we shouldn't
Worry so!
What we've missed of calm we couldn't
Have, you know.
What we've met of stormy pain
We can better meet again
If it blow.

For we know not every morrow
Can be sad:
So, forgetting all the sorrow
We have had,
Let us fold away our fears,
And put by our foolish tears,
And through all the coming years
Just be glad.

—James Whitcomb Riley.

THE PHYSICIAN'S MIDNIGHT VISIT.

It was getting late. Somewhere a clock struck midnight, and all Elmchester seemed to be in bed. The lights had disappeared from the sedate houses round about, and only Dr. Clement's lamp burned brightly, thowing a streak of red across the wet, empty and wind swept street.

It was an ugly night, and Dr. Clement put down his paper to listen. A fierce sleet beat and hissed against the window pane, and the wind drove blusteringly round the house.

It was an ugly night, and it was going to be worse, and Dr. Clement hoped that no one would call him out again. He had had a hard day, and his room was cosey and he was warm.

He picked up his paper again. It was full of stories of an absconding solicitor and of rumors of his whereabouts. He had disappeared and ruined hundreds of his clients. One of them was in Elmchester, and Dr. Clement frowned as he thought of him, worried and broken and ill.

"They ought to shoot him when they catch him," he muttered. " He is worse than a murderer."

Tonight the papers stated confidently that he was in Spain and that the police were following hard on his track. Yesterday he had been in Manchester, the day before in New York. Tomorrow he would be in a new neighborhood altogether no doubt and meanwhile he was probably somewhere close at hand —perhaps even in Elmchester itself.

Dr. Clement threw aside his paper and rose to his feet. After all, very likely the police would never find him, and even if they did it would not do much toward healing the hearts and lives that he had broken and ruined. Nothing would do that; and the old man in Elmchester who had believed he had sufficient money to last him and his wife the rest of their lives would be penniless all the same.

Dr. Clement crossed the room with a sigh and then stood still. A faint tinkle had sounded in the hall outside, a tinkle like the bell of his front door. He listened. The sleet whipped the window panes and the wind blustered on. There was no other sound, and for a moment he hesitated before he passed out to open the door.

Who could be calling him out on a night like that? He had no one so seriously ill as to need him in such haste, and if it were Lady Lynwood again he decided that he would refuse to go. Her "nerves" were too irritating for anything.

He flung open the door impatiently, convinced that he should see her tall footman on the step and hear the well known formula, "Lady Lynwood's compliments, but she is very much worse."

But when he looked only the darkness of the night lay before him. Only his own wet steps and the muddy road.

He stared and then retreated backward hurriedly as the cold wind tore past, but as he did some one started from out of the shadow—some wan thing and white, with the face of a ghost and wide, girlish blue eyes.

He stared down at her. She seemed breathless, and as the light fell full on her he saw that her lips were quivering.

"Come in," he said quickly, "and tell me what I can do for you."

She stepped, shivering, cold and wet, into the hall and looked into his face. He closed the door, and for a moment she stood before him in silence looking eagerly into his handsome, clear-cut face, as if she had a special interest in watching him closely. "You are Dr. Clement?" she asked at last slowly; and as he bowed she added, "I—I thought you were an old man, not a young man, and I—"

She stopped, and Dick Clement moved so that he could see her face more clearly.

"Well, did you want an old man?" he asked. "But tell me what I can do for you."

She hesitated agin, her eyes looking almost wildly across the hall with its pictures and statuary and heavy curtains.

"Oh," she cried at last suddenly, "I want you to come at once to my father. He is ill. He"—She looked quickly into his face, and somehow, strangely enough, a thrill ran through Dr. Clement as he met her eyes. He looked quickly at her shabby coat and hat, and as quickly thought that she would be a beautiful woman if she was properly dressed and taken care of.

"Yes," he said. "Tell me what is the matter with him."

The girl stepped back deliberately into the shadow.

"I don't know," she said, "but he has had a lot of worry lately, and—and—whoever comes to him must ask him no questions--must be secret and quick. Do you understand? He is—queer." Her voice choked a little, and once more there came to Dr. Clement an odd feeling that he wanted to help her—protect her—in spite of the odd air of mystery that seemed to be springing up about her.

"Yes," he said. "I understand. But if it is an urgent case oughtn't we to go at once?"

"Wait." She put her hand on his arm. "I want some one I can trust. I want some one who, whatever comes, can keep a secret."

She stopped, and afterward Dr. Clement wondered what madness it was that at that moment prompted him to cast caution to the winds and promise her all she wished. Perhaps it was her thin, girlish face, the anxious look in her eyes, the pitiful droop of her mouth, but at any rate he put his hand on hers and looked into her eyes.

"I'll do everything I can," he said. You can trust me."

"Then come," she cried. "My name is Waterer, and it is my father who has taken the Red house."

Dr. Clement looked at her with some curiosity. He pulled on his mackintosh and opened the door again with a quick glance at her dripping coat. She looked ill herself—ill and worried and wet through ,and the strange longing to help her, to be of use to her, came back with sudden swiftness as they stepped out into the dark and muddy road.

He held out his arm to her.

"Let me help you," he said, "it is so dark."

But to his surprise she shrank away from him.

"No, no," she said with white lips, "I am best by myself."

They hurried on, and at last Dr. Clement found himself bending to open the rusty gate of the Red House. It was a small gate in a high wall, and the house lay well hidden.

"Promise," she said quickly and breathlessly, "that you ask him no questions. I only want you to prescribe. We—we—have been abroad—on the continent for the—for the last six months and—and—he is ill—and worried and—oh! for God's sake don't question him. You promise?"

Her hand held his arm, and Dr. Clement, looking down into her strange, beautiful face, felt himself curiously powerless. He thought of all the rumors that were abroad concerning the Red House—the curious whispers about the tenant who had taken and furnished it and not inhabited it, and everything vanished before a girl's blue eyes.

"I'll ask nothing," he said. "I'll do all I can."

She looked at him steadily, and then turned and walked quickly up the gravel path to the house. As they went Dr. Clement fancied he heard footsteps behind him—pattering footsteps like a dog—but he was not sure, and when he stopped to listen they ceased.

The girl went on and reaching the door knocked on it sharply with her knuckles. It was opened instantly by an old woman who peered out at them.

"Have you got him, Miss Ida?" she asked. "Is it all right?"

Ida went forward, and Dr. Clement followed her into a lighted room, and there she faced him suddenly.

"Doctor, do your best—oh! for heaven's sake do your best for my father, and—and—believe in me—believe in us both."

She broke off, and a strange quiver passed over her face.

Dr. Clement held out his hand against all caution, and in spite of the feeling of mystery which had sprung up in his heart.

"I'll do what I can," he said slowly. "Let me go to him,"

She looked into his face and drew a deep breath and then walked slowly

The Call of the Hen

A Visit to the World's Largest Poultry Farms

BY A. R. COULSON

PART III.

A Story of an 800-Acre Dariy and Poultry Farm.

This is the third part of the story describing a week's drive through the country that contains the world's largest poultry farms.

Remember we told you in the first beginning that we would show you how large sheep and cattle ranges have been transformed into poultry farms. All these poultry farms that we describe have been large dairy farms and during the last few years have been combined with poultry.

In the first part we told you about

John McDonald.

C. H. Purvine's place. Mr. Purvine is raising 10,000 chicks on Coulson's Chick Food and last week we described Mr. Bassett's place, who is raising 6000 chicks on Coulson's Chick Food and feeding 3000 laying hens on Coulson's Egg Food and gets over 1200 to 1500 eggs a day.

On the third morning we left Tomales and drove out toward the Coast.

Just out and looking for Coulson's Chick Food. This shows the interior of one of the brooder houses on McDonald's place. The chicks were hatched out the day before and they are now being fed their first meal on Coulson's Chick Food. The Chick Food is fed dry for the first 4 days; being scattered about in the chaff on the brooder house floor.

We took the road through the canyon and there we had some of the most beautiful scenery, high mountains on both sides and a fine stream of water all along the road. Soon we came to Ocean Roar, a summer resort about one-half mile from the Pacific Ocean and a little further along was Tomales Bay, a body of water about two miles wide and ten miles long. The road was on the side of the high cliffs and as we were driving along we could look straight down into the water, 100 feet below. There were chicken ranches scattered all along through this country. One man by the name of Johnson has 1000 chickens on an island and takes the feed over to them in a boat. About 8:30 we arrived at John McDonald's place and we drove up a lane with beautiful shade trees on both sides to Mr. McDonald's residence. Now we were on a dairy and poultry farm of 800 acres (see illustration), and we arrived just in time to see how Mr. McDonald fed his poultry. He had a large feed trough about 8 feet long and 3 feet wide fastened on a truck wagon and first they went to a large granary where the feed is stored and there we saw SEVERAL HUNDRED SACKS OF COULSON'S POULTRY FOODS for Mr. McDonald buys Coulson's Food in CAR-LOAD LOTS and had just got in a full carload only a few days before. (Mr. McDonald uses so much feed on this place that the railroad has built a side track to run off at McDonald's place and it is called McDonald's side track.) They took 2 sacks Coulson's Egg Food (a balanced ration for laying hens) and then drove up to the creamery and mixed the 2 sacks of Egg Food in the feed box with 10 gallons of hot milk from the separator. (See illustration.)

The creamery on this place is one of the best in that section of the country. It is equipped with modern, up-to-date machinery, engines, boilers, separator, churning machine, etc. They milk 140 cows and make a little over 100 pounds of butter daily, furnishing the fancy trade in San Francisco. There is also a mill connected with the building for grinding feed and grains and the miller was that day grinding several tons of horse beans. Five men are employed on this ranch.

We asked Mr. McDonald what he thought of Coulson's Egg Food for the laying hens. He said he thought it was first-class and much better than ordinary feed and that the hens liked it and did very well on it. Although he had his own mill for grinding feeds, etc., yet it was CHEAPER TO USE COULSON'S BALANCED RATIONS because when he fed Coulson's food he did not have to feed any meat, as Coulson's Egg Food is about 1-5 animal foods, ground bone meal, heart and liver meat meal, Armour's dried blood meal, animal charcoal, etc., which made the food more valuable as an egg producer and kept the hens in stronger and healthier condition.

While the attendant was off feeding the hens on Coulson's Egg Food Mr. McDonald went to the feed house and got a sack of Coulson's Little Chick Feed and then we went around and saw how the little chicks liked Coulson's Chick Food. Altogether he had about 6000 little chicks at different ages from just hatched and some 10 weeks old, all being raised on Coulson's Chick Food, and they were certainly a prize lot of chicks.

In one brooder house there was about 500 chicks just taken out of the incubator the day before, and he then gave them their first meal on Coulson's Chick Food. (See illustration.)

Also the 2000 hens on the place were given their start in life last year on Coulson's Chick Food, and this year he will probably raise 4000 or 5000 hens.

The way Mr. McDonald feeds Coulson's Chick Food is as follows: The first 4 days the chick food is fed dry, scattered around in the chaff on the brooder house floor and fed about 6 times a day. After the chicks get 4 days old the Chick Food is moistened with milk into a crumbly state and fed 4 times a day. After the chicks get to be 2 months old they are fed Coulson's Egg Food the same as the hens and fed 3 times a day.

Mr. McDonald has been in the dairy business on this place for the last 18 years and it is only the last couple of years that he combined poultry with dairy business, but from now on he is going into it heavy, for hens that are fed on Coulson's Egg Food pay good profit.

Then we were taken to the incubator house and we saw 6 large incubators all filled with eggs that would hatch out in a couple of weeks; several thousand more chicks to be raised on Coulson's Chick Food.

Then we were invited in to dinner and went into a large dining room, and we had a chance to test some of Mr. McDonald's good creamery butter, and also some of the genuine Coulson's Egg Food, for we had fresh laid eggs from hens that were fed on Coulson's Egg Food, and there was no horse meat about those eggs.

Hens that are fed on Coulson's Egg Food lay good eggs! they have a bet-

One lot of chickens about 10 days old. Mr. McDonald letting the chicks out for their breakfast on Coulson's Chick Food.

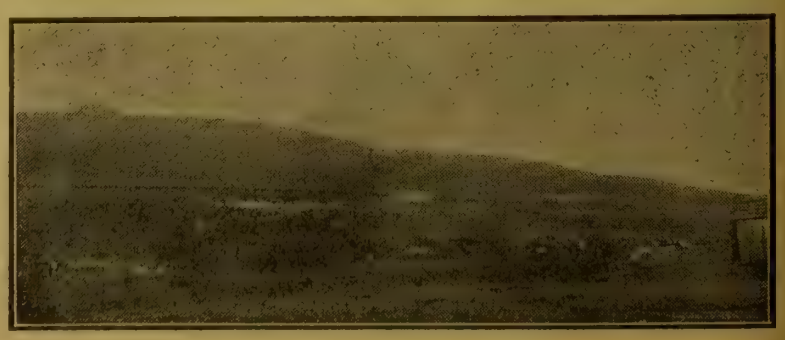
Coulson's Chick Food contains everything needed to fully nourish the chicks and by feeding Coulson's Chick Food you will be able to sell off the broilers from 2 to 3 weeks earlier than you would if you feed them on common food.

On John McDonald's place. Pullets 10 weeks old raised on Coulson's Chick Food. Mr. McDonald has many more like these. All the chicks are fed on Coulson's Chick Food exclusivey until they are about 2 months old, then they are given Coulson's Balanced Ration the same as the hens.

If Mr. McDonald can raise chicks like these by feeding them Coulson's Chick Food, why not you?

Suppose you give Coulson's Chick Food a trial. It will not cost you but a trifle more than other feed and the way it makes chicks grow is marvelous.

After feeding the young chicks just out we went around to 12 or 15 other brooder houses all containing chicks



Feeding the laying hens Coulson's Balanced Ration Egg Food; about 3 gallons is fed to each colony of 200 hens.

Interior View of McDonald's Creamery.

ter flavor and are good eating.

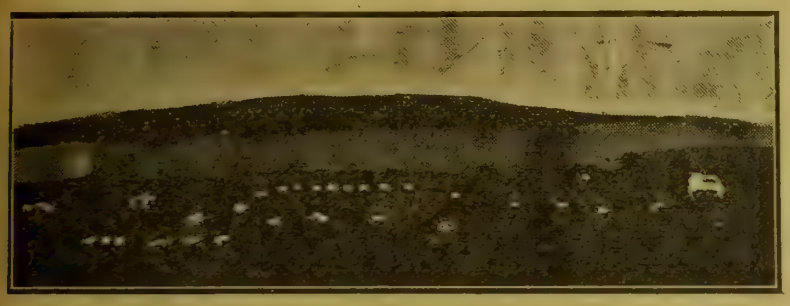
If you want to get some good tasting eggs you get them from some person feeding their hens on Coulson's Egg Food. We had many good things set before us that day and we did eat, drink and were merry, and then after lunch we got in our carriage and drove to another place which we will describe in the next issue.

We have told you about a few chickens that are being fed on Coulson's Food, but nothing to what is coming. If you have any poultry you want to go to your feed store and get some of Coulson's Food.

Remember Coulson's Egg Food makes better eggs and more of them. chicks and raises more of them. For particulars write

A. R. COULSON,
PETALUMA, CAL.

The next issue will be an interesting one.



John McDonald's 800 acre Poultry and Dairy farm; over-looking Tomales Bay. The white buildings are poultry houses. On this place Coulson's Poultry Foods are used, Mr. McDonald purchasing it by the carload.

Preparing the feed for a couple thousand laying hens. Mr. McDonald mixing up 2 sacks Coulson's Egg Food with 10 gallons hot milk from the creamery.

Los Angeles Markets.

Los Angeles, March 17.

Pursuant to the better conditions, as a result of the recent rains, the local markets have taken a lower tone in nearly all lines.

The producers are satisfied generally as to the outlook for new crops, and conditions that were prevailing a short time ago, which were critical, have now taken a turn that is looked upon with much satisfaction by both the grower and consumer in local points.

The demand for the increasing supply is reported to be very good. Quotations are as follows:

Butter.

B. of T. Cream', 2-lb roll		50

Creamery, extras	23 @23½
Dairy, extra	19 21
Dairy, choice	17 @18

CHEESE—Per lb:

Cal. Creamery, mild new, extra	12
Cal. Creamery, mild new, choice	10 @11
Young America	11 @12½
Eastern, New York Cream, Cheddars and flats, new	15 16

Eggs and Poultry.

The supply of eggs is daily heavier and values are consequently normal.

EGGS—Per doz:

Ranch, selected large	18
Ranch, good to choice	17 @17½
Store	16

Trading in poultry has been fairly active all the week but prices hold about at last quotations.

POULTRY—Old Roosters, per doz., $5@5.50; young Roosters, $6.50@7.50; Fryers, $5.50@6.50; Broilers, large, $5@5.50; small, $4.50@5; Hens, small, $5@6; large, $6.50@7; Ducks, per doz., old, $5.50@6.50; young, $6.50@7; Live Turkeys, per lb., 16@18c; Dressed Turkeys, per lb., 20@22c; Geese, per pair, $2@2.25; Goslings, $2 @2.25; Pigeons, per doz., old, $1.25@1.50; Squabs, $2.25@2.50.

Fruits and Vegetables.

The orange market continues in bad shape with free supplies offering at uneven prices and the general movement restricted within narrow jobbing confines.

DECIDUOUS FRUITS.—Apples, per box, common to choice, 50c@$1.25; fancy, $1.50@1.75.

CITRUS FRUITS—Per box: Oranges, Navels, fancy, $1@2; standard to choice, 50c@$1.25, according to size; Seedlings, nominal; Lemons, $1@2.75; extra, $3; Grape Fruit, $1.25 @2.50; Tangerines, 75c@$1.25; Limes, $6@6.50.

VEGETABLES—Asparagus, per lb., extra, 12½@14c; No. 1, 9@11c; No. 2, 6@8c; Tomatoes per box or crate, southern, $1.01@1.50; do, Mexican, $1.25@1.75; Rhubarb, per box, $2@ 2.25; Green Peppers, per lb., 10@20c; Dried Peppers, Stockton, 5@8c; southern, 8@12½c; String Beans, per lb., 10@15c; Wax, ——; Green Peas, per lb., Bay, 5@7c; do ,southern, 4@6c; Egg Plant, per lb., 10@20c; Summer Squash, per box, $1.25@1.50; Cucumbers, hothouse, per doz., 75c@$1.25; Mushrooms, per lb., 12½@25c; Marrowfat and Hubbard Squash, jobbing at ¾@1¾ per lb.

POTATOES—Per ctl., River Burbanks, $1.05 @$1.20; Early Rose, $1.50@1.60; River Reds, $1@1.10; Garnet Chile, $1@1.10; Oregon Burbanks, $1.25@1.40; Sweet Potatoes, $2.75; New Potatoes, per lb., 3@3½c.

ONIONS—Per ctl.: Oregon, $2.25@2.60; Nevada, $2.75@2.85; Green Onions, per box, 50 @75c.

Hops.

The price for new crop is 25@30c per lb, according to quality.

Beans.

BEANS—Prices per ctl.: Large Whites, $2.60 @2.75; small do, $2.90@3.15; Pea, $2.90@3.15; Lima, $3.30@3.40; Red, $4.50@5; Pink, $3.20@ 3.40; Bayo, $2.40@2.55; Blackeyes, $2.05@ 2.25; Kidneys, $4.75@5.

Live Stock.

Firmness continues the characteristic feature in the market for Live Stock and operators report a spirited trade in progress at maintained prices. Cattle and Hogs still lead in point of demand and offerings of A1 lots are sharply competed for at the highest values.

CATTLE—No. 1 Native Steers, 9@9½c; second quality, 8@8½c; thing Steers, 7@7½c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4@5½c; Bulls and Stags, 3½@4½c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4¾@5½c, gross weight; heavy, 4@4½c, gross weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs., and over, 5¾@6c; weighing under 130 lbs., 5½@5¾c; weighing 250 to 300 lbs. 5@5½c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

There is a drop of a dollar in the price of hay, with lower prices in sight.

HAY—Per ton: Wheat, $14@17.50; Wheat and Oat, $14@16; Oat, $12.50; Barley, nominal; Clover, nominal; Alfalfa, $12@13.

STRAW—Good to choice, per bale, 60@70c.

OIL CAKE MEAL—In lots of 20 tons, $29.50.

CRACKED CORN—Choice quality, per ton, $29@30.

FEED CORN MEAL—Choice grades, per ton, $29.50@$30.50.

GROUND BARLEY—Per ton, $23@24.50.

COCOANUT CAKE—In lots of 10 tons, $22; 5 tons, $22.50; less quantity, $24. Prices are mill rates and are subject to change without notice.

Cereals.

FLOUR—Net cash, Family Extra, $4.80@ 5.15 per bbl.; Bakers' Extra, $4.60@4.80; Oregon and Washington, $3.65@4.50.

WHEAT—No. 1 Shipping, per ctl., $1.38¾, choice, $1.41¼; White Milling, good to choice, $1.43¾@1.55.

BARLEY—Choice No. 1 Feed, $1.06¼@1.10; off grades, $1.03¾@1.05; Brewing, No. 1, $1.11¼@1.20; Chevalier, nominal at $1.20@ 1.40.

CORN—Good to choice, per ctl: California, new, large Yellow, $1.37¼@1.45; small do nominal; White, $1.37½@1.45; Eastern, $1.30 @1.40.

CRACKED CORN—Choice quality, per ton, $30@31.

OATS—Good to choice White, $1.27½@1.40; Red, $1.30@1.35; Black, nominal at $1.27½@ $1.40.

RYE—Good to choice, per ctl., $1.30@1.32½.

WOOL.

The first spring shearings are making their appearance in San Francisco. As a rule these early spring shearings are rather indifferent in character, and only appeal to scourers, because the fleeces are taken off before feed is sufficiently abundant to grow good sound wool.

Eastern Markets.

Grain and Produce.

CHICAGO, March 16.—The sentiment in the wheat market has been bearish all the week. The market has been feverish, owing to the weakness shown abroad and by reports from the wheat growing sections that rain or snow is badly needed.

Cash quotations were as follows: Flour was quiet and steady; No. 3 spring wheat, 88@ 97; No. 2 red, 95½@99; No. 2 corn, 51¼; No. 2 yellow, 52¼; No. 2 oats, 39; No. 3 white, 41@ 43; No. 2 rye, 72; good feeding barley, 37@40; fair to choice malting, 46@55; No. 1 flax seed, 1.10; No. 1 northwestern, 1.16; prime timothy seed, 3.05; mess pork, per bbl., 13.75@13.87½; lard, per 100 lbs., 6.95@7.00; short ribs, sides (loose), 6.87½@7.00; short clear sides (boxed), 7.25@7.37½; clover, contract grade, 11.25.

DAIRY MARKET.

On the Produce Exchange today the butter market was steady; creamery, 14@23½; dairy, 13½@21; eggs, easy at mark, cases included, 15½@16; cheese, easy, 10½@11.

Dried Fruits, Nuts, Etc.

NEW YORK, March 16.—The market for evaporated apples continues fairly active and firm, with prime held at 5½; in some instances a little higher; common, 4@5¼; prime, 5½@6; choice, 6@6¼; fancy, 7@7½. Spot prunes attracted a steady demand of hand-to-mouth character, but there are no large lots moving, and the general tone of the market is easy. Apricots are quiet, but remain firm as to prices; choice, 9½@10; extra choice 10¼@10½; fancy, 10½@13. Peaches are attracting some attention in a jobbing way, and rule about steady; choice, 6½@7½; extra choice, 7½@8; fancy, 9½@10.

CITRUS MARKETS

No especially encouraging features as to the price of oranges can be noted this week. The market seems to be in a feverish condition, with prices fluctuating daily, according to shipments. Ther has been something of a rise on small size California oranges, owing to softer weather which permitted cart men to retail the fruit on the streets. It is confidently believed, however, that prices will advance when the weather becomes settled and Florida shipments are over.

AUCTIONS.

NEW YORK, March 11, 1904.—Market firm, good demand for both large and small sizes. It is reaining steadily.

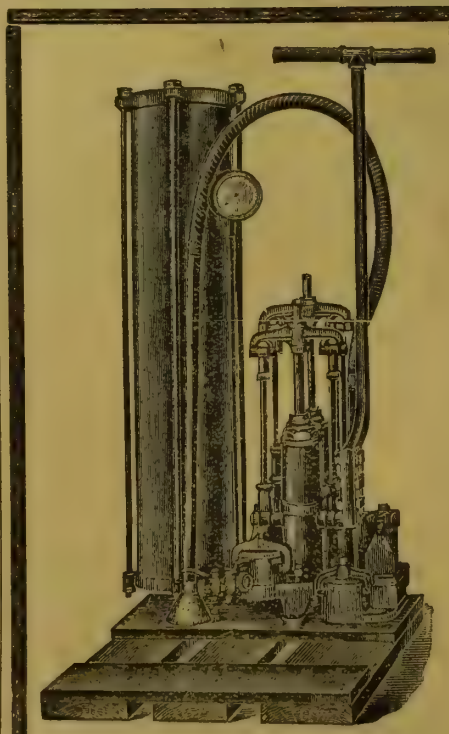
FRESNO, CALIFORNIA



SAY!

Are your trees covered with moss or scale so that they can't get a healthy growth? You are sure to have small fruit from unhealthy trees. Instead of 6 per cent you will make 300 per cent on the money invested in a thorough spraying of your trees. But if you use a cheap squirt gun pump you may as well pour the material on the ground and save your time. Use a good pump and do a thorough job and you will get results all right. Our

BEAN TORRENT

is the pump to buy. We haven't space to tell about it here, but send for circular giving full description of all our goods. We can also send you a book of formulas free. Did you ever try a Bean Clipper Nozzle? Address a postal at once to

BEAN SPRAY PUMP CO.
SAN JOSE, CAL.

Baker's Traceless Harness

This harness is of great value to all fruit growers, vineyardists and orchardists. Enables close work everywhere, with protection to trees, vines, etc., while cultivating. Perfect for all low down work. Does away with the old whiffletrees and traces. Handiest of farm equipments. Saves its cost many times a season. Endorsed by users everywhere. Write today for full information. Agents wanted.

PHYSICIAN'S MIDNIGHT VISIT.

(Continued from page 283)

toward a door communicating with an inner room. As she reached it she fell back.

"Hark!" she cried sharply. "What was that?"

They both listened and for a moment there was nothing to be heard except the soughing of the wind. Then suddenly came a sharp sound—a quick, harsh click—and then suddenly followed it the sound of a window being opened.

"Hark!" she cried. "Oh! my God, they've found him out—they've followed. Oh! my poor father."

She ran forward instantly, and, flinging open the door, dashed across toward an old man who sat listless and bent over the fire.

She ran swiftly, but she was too late. Even as she reached him a revolver shot rang out, and the old, bent and huddled figure dropped forward into her arms.

"My father!" she cried hoarsely. "Dr. Clement, for God's sake, save him—oh! save him!"

Dr. Clement was at her side in an instant, but one glance told him all he wanted to know. He took the old man out of the girl's arms and put him back gently on the floor.

"Water and brandy," he said quickly, "and the police—quick."

"The police?" she whispered.

Dr. Clement was busy, but he stopped to look up at her in surprise.

"Some one has shot your father," he began sharply; "surely"—

She stopped him.

"Not the police," she whispered, harshly. "Oh, not the police."

Dr. Clement stared.

"The man who did it," he said, quickly, "must be caught."

She shook her head, and then with sudden haste bent over her father.

He had dropped back, his head lolling on Dr. Clement's arm, his eyes looking up, and Dr. Clement, bending hastily, caught his last words.

"Not the police," he whispered, "not yet—keep me safe—for a little while—until I am dead."

His voice stopped. Dr. Clement looked at him curiously, and then Ida flung herself to the floor beside him.

"Oh, father, father, what shall I do?" she cried.

The old man stretched out a feeble hand.

"Try to explain," he said slowly. "I—am not—quite as bad—as they think. I didn't mean"—

His feeble voice died away. Ida crouched beside him, holding his hand.

"Oh, father!" she sobbed.

* * *

A little later Dr. Clement was looking into the eyes of a girl which were always the most wonderful eyes in the world to him.

"Tell me what it means?" he asked.

She faced him bravely.

"It means," she said, "that—that father was the missing solicitor—the man who absconded the other day."

Dr. Clement started and his face grew stern.

Ida put out her hand.

"Hear me," she cried. "He failed and ruined people and ran away, but oh, hear me. He wasn't quite as bad as they made out. He didn't do it from carelessness or on purpose. It all began two years ago. You know from the newspaper accounts that he was trustworthy and honorable then; you know that he had a good practice and that everything was all right then. But two years ago he joined a company that turned out to be a swindle. He didn't known it at the time—he didn't dream of it. There were big men's names on the board, it seemed all straight and honorable, and he put a lot of money—clients' money—into it; but a year afterward it began to go wrong, he began to see what was going to happen. At first he thought he could get himself and his clients out, but he couldn't and it ended by losing everything and coming here. Do you understand?

"He ran away," she whispered. "Oh yes, he ran away, but he did it for me. He thought if I could hide until I had learned how to earn my living it would not matter, and so we came here for me to learn to paint. I could do a little, and in a little while I thought I could do more, but I have had no chance. A week after we got here we found we were dogged. Some one had followed us—one of my father's creditors had found out where we were and waited, and tonight he managed to get in and"

Her voice broke and faltered, and Dr. Clement, foolishly perhaps, held out his hands to her.

"I understand," he cried. "I understand it all; and now you must come home with me. My sister will look after you for a bit. Your old housekeeper can come, too, if you like. But you must come away from this house."

"Oh, it is good of you," cried Ida.

Dr. Clement looked at her for a moment with a curious expression in his eyes.

"You will?" he said.

Ida lifted her head quickly.

"You will come for a while," he added, "and afterward—"

Who cared for the afterward? The word died in his throat. For the present it was sufficient that a girl's eyes were looking into his and a girl's hand lay on his arm. For the present it was sufficient that he was blind to everything else.

* * *

Afterward—a few days afterward—when Dr. Clement visited the old man who had believed himself ruined he found him jubilant. He had that morning received a sum of money representing half what he had lost.

"Bless you!" he cried; "we can manage on that, my wife and I. We can manage, thank God. And he couldn't have been as bad as we thought," he added. "After all, he meant well or he wouldn't have sent me back this."

He tapped the roll of banknotes, and Dr. Clement looked at him curiously, remembering the holes these same bank-notes had made in his own banking account.

"No," he said, "perhaps not."

* * *

And afterward, at the Elmchester parish church, a quiet wedding. And no one dreamed that the bride was the absconding solicitor's daughter, and everyone congratulated Dr. Clement.—The Tatler.

RECIPES

Eat Little, but Have That Little Good

Tomatoes and Eggs.—Put the tomatoes into boiling water for a few seconds to loosen the skin. Skin them and chop finely, add pepper and salt to taste and a shave of onion; put into a frying pan with a good lump of butter and fry until the watery part is consumed. Have the eggs (1 to each good-sized tomato) just mixed, not whipped; stir them lightly into the tomatoes with a fork for two or three minutes; turn out on a hot dish and serve with thin bread and butter.

* * *

Orange Salad—Four eggs, 2-3 cup sugar, 1 small teaspoon salt, 1 pinch cayenne pepper, 1 cup cream, butter size of walnut, 2-3 cup lemon juice, add very slowly. Twelve oranges, one-half as much celery. Cook dressing until it thickens. Mix with oranges and celery (chopped fine) and serve in lettuce leaves.

* * *

Jellied Chicken—One good-sized chicken, boiled until tender. When done put aside to cool, saving the liquor in which it was boiled. When the chicken is cold remove the meat, rejecting the skin and bones; crack the bones fine; put them with the skin and one small chopped onion, two bay leaves, ½ teaspoon celery seed, into a saucepan, add liquor in which chicken was boiled, simmer until reduced to one pint, strain and season; moisten a mould or pan with cold water, arrange a layer of chicken in the bottom of the mould, then one of slices of hard-boiled eggs, sprinkle lightly with salt and pepper, a little chopped parsley; add another layer of chicken, and so on until the ingredients are all placed. Strain over the chicken stock and stand aside over night to harden.

* * *

Fruit Pudding—Three-fourths box gelatine, 2 oranges, 2 lemons, 2 bananas, 6 figs, a few nuts blanched and cut into bits, and whatever other fruit that is pretty or available. Soak gelatine in ½ pint cold water one hour, add ½ pint boiling water, juice 1 lemon and 2 cups sugar. Strain, pour into mold until it begins to harden; add fruit cut into pieces. Serve with whipped cream or soft custard.

Although water is the natural element of geese, yet it is a curious fact that they fatten much faster in a situation remote from rivers or ponds. They should not be allowed to run at large when they are fattening, as they do not acquire flesh nearly so fast when allowed to take much exercise. Like other fowls, they may be brought by proper management to a great degree of fatness, but the period at which they are the fattest must be chosen to kill them; otherwise they will rapidly become lean again and many of them will die.—The Connecticut Farmer.

A very satisfactory summer arrangement for bedroom windows is to have fly screens outside the sash in one frame the full length of the window, so that the latter may be opened from the top and bottom without disturbing the screens. Screwed or bolted in place from the inside they also serve as a protection, not so complete, of course, as iron rods or a patent burglar alarm, but still something of a safeguard.

MIDLAND.

Do you feed the Midland?

That is, the Midland Poultry food. Lots of folks say its 'way up in its results. Dr. Nishkian, the chemist in charge of its manufacture is said to be one of the most expert chemists in the country, and that his combination in the Midland is on such scientific principles that no imitators can truly imitate.

It has been used up and down the Coast and is today a standby with many of the best poultry men. One car load is now in transit to the Petaluma Incubator Co., of Petaluma, and one to Henry Albers, of Los Angeles, and one to the agency in San Jose. In the East it has become the standard and is widely used.

Williams Bros., the Brown Leghorn breeders of Trinidad, this State, says:

Fruitvale, Cal., Oct. 5th, 1902.

Petaluma Incubator Co., Petaluma, California.

Gentlemen: We must say that we are very much surprised at the quick results from using the "Midland Poultry Food." A few days before the recent State Fair we began feeding our exhibition birds with this food, most of the matured ones not being through moult. Their combs developed in a few days, and they were in the very pink of condition, when by our usual methods it would have taken three weeks longer. We are convinced that "Midland Poultry Food" "hits the spot desired," for anything which so quickly and satisfactorily conditions birds for exhibition is the food to use for all kinds of poultry under all conditions. It produces good health. Very truly yours,

WILLIAMS BROS.

KEEP THE STOCK GROWING.

The Cultivator has often referred to the necessity for keeping stock growing right along. This not only refers to colts and pigs, but especially to cattle. Let it be remembered that if an animal is not kept growing as quickly as sufficient and suitable food will make it grow, the cost of maintenance is largely increased. It is increased in proportion to the extent to which growth is hindered from want of a sufficiency of the right kind of food. An animal that through inattention or improper feeding stops growing, loses its capacity to utilize food in the best possible manner. This is very clearly shown in the difficulty experienced in putting a fine finish upon animals that have been stunted when quite young.

"Eggs are going like hot cakes. Have had excellent returns from my ad. in the Cultivator." So says H. H. Holland, of the El Oro Poultry Farm of Fresno. Its a mighty good combination—well bred stock advertised in the Cultivator.

J. W. Bairstow writes that he still has some of those famous Tilton apricot trees in stock; also a number of peach trees. The Tilton has proved a sure bearer every season and should be largely planted this season.

A. R. Rideout, the berry grower of Whittier, writes: "I am well pleased with the result of my ad. in the Cultivator.

A PRACTICAL FARMERS' INSTITUTE

A Visit of Representative Orchardists of Southern California to the Magnificent Orchard Property of the Riverside Trust Co.

"This has been a most instructive day."

"A delightful occasion."

"A most practical farmers' institute," and other like expressions were given as a party of fifteen, mostly representative orchardists, parted on the railroad platform at Riverside last Monday p. m., and bade each other good-bye.

The occasion had been an informal visit of the following named gentlemen to view the orchards of Arlington Heights section, and to learn of the methods of culture, picking, packing and so forth. The "so forth" is to cover "spraying," "fumigation" and a thousand and one other questions which naturally spring up when a dozen brainy fellows with eyes wide open get together.

The party consisted of W. G. Fraser, James Mills, and F. A. Little, of the Trust Co., and Arlington Heights Fruit Co., who were the entertainers: Prof. A. J. Cook and Prof. C. B. Sumner, of Claremont; C. C. Chapman, Fullerton; Frank L. Palmer, North Pomona; C. C. Teague, Santa Paula; C. E. Ramsey, E. L. Koethen and R. P. Cundiff, of Riverside; and the press was represented by A. F. Clark, of the Riverside Press; Mr. Hartrauft, of the Fruit World; and Mr. Messenger, of the Cultivator. Mr. Lefflingwell, of Whittier, was to have been present, but poor health prevented.

This movement was inspired by Prof. Cook, who recently visited the Arlington Heights orchards, and was so impressed with the thrift of the orchards and with the improved methods of culture and fruit handling as carried on under the direction of James Mills, superintendent of the property, that he at once set about getting an invitation for other orchardists to visit the ranch.

This property is owned by a syndicate of English capitalists which was organized by Matthew Gage, and, at first, was under Mr. Gage's management. The general administration is now in the hands of W. G. Fraser and James Mills is superintendent of the ranch, picking, delivery of fruit, etc., work, and T. A. Little has charge of the fruit packing and marketing, which is done by the Arlington Heights Fruit Co.

The property consists of about 2000 acres, of which 1500 are in oranges and 500 in lemons, and all is under the Gage canal. The older orchards are about eleven years old. The product this year will be about 600 car loads of oranges and 400 of lemons. This will necessitate the payment to the railroads alone of over $300,000 for freight.

The party met at the Glenwood Hotel on Sunday evening, to be ready for an early morning start. Messrs. Fraser, Mills and Little, and Mr. Hughes met the party with autocars and Oldsmobiles and proceeded to the ranch via Victoria Drive. Victoria Hill, with a magnificent view of valley and mountain, Roosevelt, Palm, Prospect Hill, from which a more extended view is had, are all passed. From the summit of Prospect is a view which we believe gives a sweep of the eye over a section in which more is invested and which produces more wealth from horticulture and agriculture than any of like scope in the world. At our feet lie tens of thousands of acres of regularly laid orange and lemon groves, still loaded with fruit, with irrigating canals and graveled roadways here and there. Beyond and north, were Highgrove, Colton, San Bernardino, Rialto and Bloomington, while around to the west were Ontario, Claremont, Pomona, Chino, and, nearer, Corona. All around this mighty ampitheater rose range on range of hills topped by snow-clad mountains. Mr. Chapman was appointed poet for the occasion but he confessed to shortage of words, though he did have the inspiration.

As noted above, the meeting of these orchardists was for study in a practical way of various questions of soil culture. The first halt of the autos was in a Valencia and lemon orchard, to witness the manner of irrigation. Mr. Macoun, the foreman, was on hand to explain the method. The holdings of the company are divided into three sections, designated as Osborne, Windsor and Balmoral, each section with a foreman.

Foreman Macoun had in hand a most difficult piece of irrigation. The rows were long, the grade very heavy, the soil of a nature to wash badly with a head of any size. The control was perfect. In fact not a drop was wasting at the lower end and in every furrow was only a tiny trickling stream, the final wash being prevented by a series of dams in the furrow, also by zigzag-streams, made possible by cross furrows, laid with plow, fourteen or fifteen inches deep. These furrows were made before the direct furrows were laid. There were only four direct furrows between rows, which Mr. Mills deems ample if the work is thorough.

But Mr. Mills' idea of thoroughness would paralyze some orchardists. For instance, he takes three days to get the water the full length of the row. The rows are 36 trees long—about 1200 feet. The water is started on the first day in a small stream, which gradually soaks its way toward the lower end. There the pockets and zigzag furrows force a still slower advance and after three or four days of such soaking the ground is saturated to a great depth. Handled in this way a thirty-five inch head will cover 25 acres and the work is so simple that one Jap laborer covers completely 280 acres every six weeks. If any one in California does cheaper irrigating than that it has not been announced.

One strong point in favor of the deep plowing for the check furrows is that it is fairly close to the trees and cuts many lateral roots which as Mr. Fraser remarked, "stops poaching." That is, a big, thrifty tree often fills the ground with surface laterals to that extent that a smaller tree near it is unable to establish itself against the stronger neighbor. Besides, it forces deeper rooting and consequent drawing on the lower soil for its moisture and nourishment.

WHAT PROF. COOK SAID.

Some misunderstanding was created by the wording of Prof. Cook's article in this paper of March 4, and the Cultivator has been charged with the responsibility for this misunderstanding. In order that justice may be done the Cultivator and Prof. Cook, as well, we publish the introduction to the article, which was withheld because of the fact, as we believe, that the statement that fumigation is doomed is not correct, so long as it can be used to advantage on certain scale which distillate may not destroy. As the Cultivator has no interest in the methods employed by citrus growers to rid their orchards of ruinous pests except to encourage the best methods and the proper methods, to accomplish the desired end, it does not care to devote its columns to airing the opinions of the advocates of either fumigation or distillate spray. The truth is what we all want and the sooner it can be arrived at the better for the citrus growing interests of this State. Here is a part of the unpublished paper of Prof. Cook referred to above:

FUMIGATION DOOMED.

"It is with special delight that we see that the great promise of distillate spray, in the light of cumulative experience is more than realized. Over a year ago it was evident to every close student of orchards where spraying with this new and most valuable insecticide and fumigation were tried close side by side, that we had in the distillate spray a most valuable adjunct in our orchard work. It was clear, that it was, when thoroughly applied, as effective as the best fumigation, and more effective than most fumigation. This, with the fact that it was so very much cheaper, and the further fact that it could be done by daylight, and best done by the owner of the orchard, made its growth in popular favor most phenomenal. It is gratifying indeed to note how quickly people have grasped the situation and how generally they have adopted this better method of orchard management. It looks now as if fumigation tents would very soon be utterly relegated to the refuse heap.

I am led to these remarks by an item in a paper and a recent visit to the famous orchard of the Arlington Heights estate. We all know Commissioner Pease, of San Bernardino county. We all know how greatly he favored fumigation and with what good reason. In his hands it was a wondrous success, though very costly and laborious. The item in the paper is to the effect "that the Commissioners of San Bernardino county have discovered in some of the citrus orchards a prosperous colony of red scale." It is farther stated that "they have commenced spraying to exterminate this dreaded pest." One of our best inspectors, who, himself, is a recent convert to spraying, having sprayed his own orchard, lately advised fumigation for red scale. It seems that Mr. Pease knows of a better way."

The balance of the article published March 4 was exactly as Prof. Cook wrote it.

ORANGE MARKETING PROBLEM.

There is considerable agitation among the orange growers of Southern California in the matter of marketing their product. The past season has been fraught with unprofitable results and this situation has awakened an inquiry as to the underlying cause for the predicament in which the growers find themselves; also anxiety as to what the future holds for the orange industry.

Into the contention has come a journal with a scheme devised to lead the people out of the "slough of despond," in which they find themselves and to place the orange business on the high road to future prosperity. This scheme, or plan, or whatever it may be termed, contemplates the creation of a league of orange growers who shall, spartan-like, stand against all opposition and all odds, and force recognition of its rights, no matter at what cost.

* * *

It is asserted by those who claim to know whereof they speak that there is an ulterior motive in this apparent philanthropic Moses of the people; that behind the editor of the paper, so earnest in the orange growers' interest, is an ambition for political preferment. Whether this be the case or not is no concern of the Cultivator. "On the face of the returns" the motive appears honest and the cause defended is certainly just. So long as present conditions obtain it is the prerogative of any fruit grower to suggest plans for bettering the situation, for we all know something is wrong somewhere, or the fruit industry would not be in the critical condition which we find it at the present time. That the fault is with the Citrus Union, the Fruit Agency or the transportation lines we are not prepared to say at this moment, nor do we know as we shall ever be able to say. All we know is that the present season has been one of the most unsatisfactory to the grower he has ever experienced.

* * *

All his losses by frost, drought and other drawbacks from the elements, have not equalled the losses sustained this season, with a crop superior to any marketed in California for many years. The oranges, while fine in every particular, have sold so low in some instances, it is asserted, as to bring actual loss to the shipper.

Now, why is this?

A number of reasons have been assigned to account for this unhappy condition of the market, some of which appear to be worthy of consideration. The severity of the eastern winter—the coldest in thirty years—rendering transportation difficult and tedious; the appearance of the Florida crop of oranges which, for ten years or more, has not been a factor to consider in the marketing of California oranges; the high tariff charged by the railroads, and the insufficient number of cars put at the disposal of the California business, as well as the tedious and delayed routing have all had a tendency, not segregated, but collectively, to depress prices and bring the collapse of the market which has resulted in the present attempt to take heroic means to find out a remedy for the existing trouble, and to ascertain if the business of producing oranges may not again be made lucrative.

* * *

The charge is made that the marketing methods employed by the auction agencies are detrimental to the orange growers; that the Fruit Agency and the independent buyers have each sacrificed their fruit to damage the business of the other. This is denied by the Fruit Agency and by the independents, each of whom claims to have sold its consignments to the best advantage possible under the depressing conditions which affected the market.

* * *

One of the plans suggested to bring about a return of satisfactory conditions is the establishment of a central auction at some point in the State where all fruit may be sent and sold to eastern agents. This plan, it is alleged, would relieve the shipper of any charges beyond the point where the fruit is shipped, and place the responsibility of fixing eastern prices upon the agencies accepting the fruit.

In response to an enquiry made of President A. H. Naftzger as to the practicability of this plan, he writes:

"Answering your inquiry as to what I think about the proposition for establishing a market for California oranges by selling at auction at some central point in Southern California, say at Colton, I have to say that this is by no means a new idea. This idea was exploited in the newspapers of Southern California about eight years ago and has been discussed to some extent during these intervening years.

"Speaking plainly and using a somewhat familiar and rather significant term, I should say it is a 'pipe-dream.' Utterly impracticable. I can think of no single sound argument in its favor. There are many reasons against it, chief of which perhaps would be that we are obliged to have every possible medium through which we can distribute our rapidly increasing crops. The immediately available medium and the proper one, is the jobbing trade of the United States. There are probably 1500 to 2000 reputable fruit jobbers in the country, many of whom are doing business on limited capital, and are not in financial shape to come or send to California and buy fruit and pay for it here. They must have a quicker turn for their capital. This they can have by buying and paying for the goods on arrival in their market. It may be said in answer that this could be accomplished by accompanying the shipment with a sight draft to be paid on arrival. In this case the sale would be either in California, or it would not. If the jobber is obligated to take the goods on arrival he must of course necessarily buy them cheap enough in California to cover the possible risk of loss in transit, which would mean low prices. If he was not obligated to take the goods, then it is no sale at all, and the shipper is left with the goods on his hands rejected at the other end of the line and no facilities for marketing, and the serious situation would be completely demoralizing, but a further and even more serious objection to the plan is that even if the jobbers were willing to send a representative to California and buy fruit for them, the slightest disturbance of market conditions in the east would check the sales here, and create an instant blockade. For instance, in order to move the crop, we should be sending 200 cars a day steadily for a number of months. Suppose these were concentrated at Colton to be sold at auction. Markets were heavy in the east. The buyers simply say no, and leave the fruit untouched. Tomorrow morning there are two hundred cars more offered, making 400 cars, and it looks worse to the buyers than it did the day before. The next morning, there is 600 cars, and within a week, it would be possible for the buyers by a little concert of action, to completely deadlock the business, and the growers would be helpless because they have no other avenue through which to sell the goods.

"If it be answered they must maintain selling facilities to dispose of the fruit in case it does not sell at auction, then there is nothing more to be said, because the attempt to sell at auction, unless it cover practically all the goods, would be a complete failure, because the jobber would be uncertain as to what other fruit was coming into his market, and would refuse therefore to buy in California. The proposition is merely another form, and an impracticable form of selling f. o. b. California. It is certainly a sound business proposition, and a desirable one to sell f. o. b. California as far as possible, but years of experience have proven that it is only possible to a limited extent. Therefore the question as to whether it was sold f. o. b. in car lots at private sale or attempted to be sold at auction is entirely immaterial. The real question is, can the crop be handled in that way? Experience has demonstrated that it could not be handled f. o. b., and the objections, as I have stated, to an attempt to do so by selling at auction are much more fatal to the project. I can think of no good that could possibly come of such an attempt, except to afford an opportunity for a few brokers to act as buyers for eastern jobbers, and get their commission for so doing.

"I believe that our relation to the jobbing trade in the United States is such as to put us in as close relation to them as anybody can be in the business, and our information is to the effect that the jobbers have no desire whatever to pursue a policy of this kind. We have almost innumerable voluntary statements from the best trade the country over to the effect that they prefer to buy their goods where they can inspect them and see exactly what they are buying, and whether the goods are suited to their particular trade, and pay the market price at the time.

"I have said this much because you have requested me to say something on the subject, although I must frankly state that I do not consider the question of any real importance, because it is so entirely impracticable, as not to appeal to business men. It is purely visionary.

"Very truly, A. H. Naftzger."

On Wednesday of this week a meeting was held in this city between representatives of the railroads, consisting of the following: Southern Pacific, J. C. Stubbs, traffic director; William Sproule, freight traffic manager for California; George A. Parkyns, assistant general freight and passenger agent, and E. O. McCormick, passenger traffic manager. For the Santa Fe, Paul Morton, third vice-president; W. B. Biddle, freight traffic manager; Mr. Chambers, general freight agent, and J. L. Leeds, manager of the Santa Fe Refrigerator Dispatch.

The California Fruit Agency Committee consisted of A. H. Naftzger, president; F. Q. Story and Thomas O'Neill, vice-presidents; G. W. Felts, secretary; F. P. Fay, Los Angeles; A. P. Harwood, Upland; E. S. Moulton, Riverside; E. F. Van Luven, Colton.

The discussion between the parties at interest was prolonged and heated. The representatives of the carrying lines, Mr. Morton, Stubbs and Sproule, stoutly maintained that the low prices of oranges are not caused by competition with other sections of the country, but by competition between the shippers of California themselves. The continued low prices are caused by the conflict between these interests, not by the tariff charged by the railroads nor the manner in which the fruit is handled in transit, they said. To this assertion Mr. Naftzger demurred in strong terms.

"I deny the statement that the cutting continues incessantly," declared President Naftzger. "No one but a novice would believe it. You men charged with maintaining this tonnage and directing the affairs of your corporations, need to study these questions and get a better understanding. When a competitor cuts 5 cents a box the larger seller does not always cut. To the contrary the larger seller in 90 per cent of such instances holds off and lets the little fellow shoot his jolt, and get out of the way. Certainly, except in instances of extreme warfare for coveted territory, the cut does not extend beyond one or two cuts.

"Mr. Morton makes a distinction between the competition among ourselves and the competiton from other orange-producing sections, as the cause of lower price levels. I have to say this, and I say it forcibly, and without fear that you can doubt it. It does not matter by what process the lower price level is attained—if it be from one cause, or if it be from another—when we have to sell oranges below the cost of growing and packing them hundreds of our growers are going to stop production, and you are going to lose the freight. Hug any delusions that you wish—we have arrived at that point where you are not going to have the goods to haul unless we can have a return price that will induce production."

Along this line the debate went on for over two hours but the result of the meeting was that the representatives of the railroads refused to make the reduction of 20 per cent on the freight rate on oranges requested by the fruit men, pleading that the railroads could not afford to haul the fruit for less than $1.25 per 100 pounds, the rate now prevailing.

* * *

At the conclusion of the conference Mr. Naftzger and E. S. Moulton issued the following signed statement.

"The conference was in relation to the reduction in the freight rate. This matter was taken up by the California Fruit Agency with the transcontinental companies in the summer of 1903, and somewhat extensive figures showing the cost of production and the selling prices of oranges was submitted to them in the month of September. A number of conferences were held about that time and between that time and the opening of the shipping season. The conference today was for further consideration of the same facts then presented, and further facts and data prepared by the California Fruit Agency bearing upon the question of the cost of growing oranges, the manner of packing and selling, the increase in production, and the bearing upon the whole industry of the freight rate, the committee asking for a reduction, it being generally understood that a reduction of 20 per cent would be asked for, although no specific figures as to the percentage of reduction were discussed in the conference.

"Every question bearing on the matter in hand was fully and freely discussed, with the result that the petition for a reduction was denied by the railroads upon the ground that they could not afford to haul oranges for a less rate than that now prevailing, namely, $1.25 per 100 pounds.

"The committee believes that it produced irrefutable figures showing that the orange business of Southern California cannot continue to prosper under the present freight and refrigeration charges. Theories were brushed aside, and the absolute facts covering the entire operations of last season were produced to sustain its contentions. The matter will not be allowed to drop here as the committee will continue its efforts."

Here it would seem the matter is at rest until the Federal Court and the Inter-state Commission shall determine the questions pending before them for decision.

Mr. C. W. Leffingwell Jr., has a very interesting paper in the Dairy department this week on the "Large and Small Jersey Cow." This paper was read before the Jersey Cattle Breeders' Association at its late meeting and elicited much favorable comment.

A New Industrial Plant.—One of the most important steps of recent date in the industrial line was the formation of a big steel company of well known capitalists, last Saturday, at San Diego. Its capitalzation is $100,000,000. Of that amount, one half has been subscribed and a contract for the plant has been let for $30,000,000. The name adopted is The Pacific Steel Company. It will build ships, engines, armor plate and mining machinery. Those engaged in the enterprise have no time nor money to waste on speculative schemes. It will be the largest industrial plant in Southern California. It means much for this section.

CITRUS FRUITS

A PRACTICAL FARMERS' INSTITUTE.

(Continued from first page.)

The cultivation is most thorough. It is deep. It is often done.

The first filling of the furrows is done with the weed cutter attachments, sometimes called cyclone cutter. Soon after the "chisel tooth" cultivator is set for six inches depth and while the beam is nearly nine feet long and has fifteen teeth, it is kept at six inches depth and though it is a load for the four mules, is readily handled by them and twenty to twenty-three acres per day is covered by the team. The orchardist who is looking for an easy running cultivator of light draft, which will be easy on the team, will be disappointed. The party soon had foot rules prodding the earth and the full six-inch depth was usually reached before the hard ground was felt.

Attached to the cultivator and dragged behind was a large chain to assist in pulverizing and leveling the surface. The depth to which the cultivation is carried resulted in a liberal supply of small roots clinging to the teeth of the cultivator, especially on the end toward the tree, but this has no objection to the orchardist who will irrigate deeply enough that the lower roots may have abundant nourishment.

The quality and amount of the work done by Mr. Mills' men called forth some comment, but he said it was all due to good men, well paid, well fed, and given to understand that the job ended with inferior work and that, when possible, promotion followed competent and intelligent work.
